Opportunities are many for the furnishing of specimens of out northern chars. Mr. Napoleon Comeau showed me a fish at Godbout last summer which had been caught in one of the neighboring streams, which looked marvelously like *Salvelinus aquassa marstonii*. Mr. W. C. J. Hall, superintendent of the Laurentides, National Park, read a paper on the park the other day before the Canadian Forestry Association, in which he claimed that the Alpine char is to be found in the park, and this fish he confounds with *Salvelinus marstonii*, which there is but little doubt is to be found in the waters of the park, since it is known to exist in some of the neighboring lakes. Jordan and Evermann (Vol. I., p. 516) are very positive, however, that with the saibling (*S. alpinus*), the Alpine char, *Salvelinus marstonii* has still less in common than with other northern chars. With the exception, of Professor Garman's distinct classification of *Salvelinus aquassa marstonii*, it is really astonishing how little real progress we have made since the days of Sir John Richardson in our knowledge of the far northern American *Salmonidae*.

#### Big Trout of the National Park.

Mr. Hall makes an interesting reference in his paper on the Laurentides National Park to the big brook trout, so-called, which are to be found there. It is doubtful if larger specimens of *fontinalis* are to be found anywhere. Mr. Hall is positive that there are ten-pound fish of this variety in some of the waters of the park, and the fact that some exceeding nine pounds

each have already been captured, seems to fully warrant his belief. Not only may permits be obtained from the Government at Quebec for fishing within the limits of the park, but some of the lakes and rivers contained in it are actually under lease to fish and game clubs. Thus Lakes Batiscan, des Passes, and some others form part of the waters which have been under lease for many years to the Triton Fish and Game Club. The regulations governing the fishing in the waters of the park provide for fly-fishing only. But in the case of some of the larger lakes, *namaycush*, or so-called lake or gray trout, are found, and for these waters, as well as for some others in which the brook trout secure so much bottom feeding that it has been found impossible to tempt them with surface lures, the Government rules have been relaxed and trolling is now permitted. Mr. Hall points out in his paper that the basin of the Jacques Cartier River is altogether withheld from lease, and reserved for transient anglers fishing under Government permit. A five-mile drive from Quebec over good roads brings the angler to the starting point on the river, where Government canoes and camping outfits are kept in readiness, and good river men can be secured at moderate wages.

#### Will be Missed in Angling Circles.

Sportsmen who have fished or hunted in the park in recent years, and who have entered it through Tewksbury, by the route from Quebec already described, will regret to hear of the death of George Colvin, the very efficient and very gentlemanly chief guardian of the park, who had his headquarters at Bayard's, just below where the boats are usually taken for the ascent of the river. George was a handsome, strapping fellow, whose heart was always in the right place, and who took a pleasure in doing everything that lay in his power to promote the comfort and happiness of all visitors to the park who came in his way.

E. T. D. CHAMBERS.

### The Piratical Kingfish.

"THE kingfish of Florida straits is of the same family and very much like the northern bluefish, except that he is larger, stronger, fiercer, more voracious and more of a pirate generally than his northern brother," said Captain Wardwell, of the trim schooner Julia and Nancy, as we sailed in and out amid the green keys of South Florida.

"I can tell you some tales about him that to a landsman may seem incredible."

All begged the captain to proceed, as there was no limit to our credulity, and he continued:

"I was running into Santa Lucie one day when a kingfish leaped aboard and down the companionway, landing at my feet as I sat in my cabin pouring over one of Miss Parloa's cook books. I called Moses, the black cook, and had him served up for dinner."

"There is nothing unusual in that," said Colonel Allamb, the great cattle king. "I was on a cattle schooner once, sailing down to Key West, when a kingfish jumped for a mullet and, missing, went clear over our stern, cutting off the tip of the steersman's nose as he passed. The fellow tumbled off his perch in a dead faint, and the schooner broached to before anyone could reach the wheel."

"I knew of a feat of the kingfish even more wonderful," said Williams, the orange buyer. "You may know Robertson, for many years steamboat factor at Fort Meyers, on the Caloosahatchie River?" Several of the party knew Mr. Robertson.

"What is his reputation as to truth and veracity, gentlemen?" continued Williams.

The cattle king said he had never known him caught in a lie, and the others agreed that his reputation in that respect was without blemish.

"He told me," added Williams, "that once, standing on the steamboat dock at Fort Meyers, he saw a kingfish strike a mullet, and, with it in his mouth, go clean over the ridge pole of the freight house and slide down the roof on the other side. He had them both for dinner."

"It is a fact," remarked Captain Gibson, a veteran wrecker, "that one of our men had his swaller pipe nearly cut in two by a kingfish that cum aboard the Sally Mariar, much as these gentlemen have described it to you."

The present writer has no doubt at all as to the accuracy of the stories told above. Later, he made the voyage from Cutler to Miami in a fishing schooner, her chief quarry being the game kingfish. The captain had his son with him, a bright, active lad of fourteen. He was barelegged to the knee, and the stranger noting a livid, ugly-looking scar on his leg, asked what caused it.

"He war bit there by a kingfish," said the father, "after Tommy, here, had shooked him from the hook. They're longer than a shark, and a doggoned sight livelier in the water."

CHAS. B. TODD.

#### Dynamiting the St. Lawrence.

CORNWALL, Ont., March 26.—*Editor Forest and Stream:* I notice a letter in last number of *FOREST AND STREAM* complaining of the falling off in the number of fish caught in the Thousand Island waters. The same state of things prevails in the waters adjacent to the Long Sault, on the St. Lawrence, but from a different cause from that cited by Dr. Latimer. Here it is from the netting and dynamiting of mature fish, which is carried on to a very great extent all through the season. Fish are exposed for sale in the shops here which show plainly the net marks or the action of dynamite, and the size of the strings, if other evidence were wanting, is proof that they could never have been caught with hook and line. The transgressors are mostly Indians, and we hear that for one pound sold in Canada ten pounds are sold in the States. Besides the fish captured, a great many are killed by dynamite, and can be seen on the shore rotting. So far, no very active efforts have been made by the fishery inspectors on either side to put a stop to this destruction of fish, but the authorities on both sides of the river will have to put their heads together or there will soon be few food fish left, where they used to be very abundant.

C. W. YOUNG.

### Legislation at Albany.

ALBANY, N. Y., March 28.—Governor Odell has signed Assemblyman J. T. Smith's bill (printed No. 771) providing that there shall be no open season for deer in Columbia, Delaware, Dutchess, Greene, Oswego, Putnam, Rensselaer and Ulster counties prior to Sept. 1, 1907.

Bills have been introduced as follows:

Senate Forest, Fish and Game Committee, appropriating \$350,000 for continuing the acquisition of property in the Adirondacks, and \$100,000 for acquiring lands in Catskill Park. The money is to be expended under the direction of the Forest, Fish and Game Commission.

Senate Forest, Fish and Game Committee: Concurrent resolution proposing an amendment to Section 7 of Article 7 of the State Constitution relative to the forest preserve, allowing the Legislature to authorize the removal of dead timber on burned areas so far as is necessary for reforestation.

Senator Malby: Amending Section 187, relative to the proceeds of actions by the people of the State.

Assemblyman Wainwright: Amending Section 100 so as to make this article apply also to Westchester county.

Assemblyman Cocks: Amending Section 102 so as to provide that gray squirrels shall not be taken or killed or possessed at any time in Nassau county.

Assemblyman F. C. Wood: Amending Section 11 so as to allow the Forest, Fish and Game Commission to restock the Adirondack

region with elk. (Same bill introduced by Senator Townsend.)

Assemblyman Cocks: Allowing the taking of trout from inland waters of Long Island for the purpose of selling the same.

The Senate has passed the following bills:

Senator Townsend's (12-853), for the protection of wild black bear.

Senator Townsend's (15-870), providing for licensing non-resident hunters.

The Senate has advanced the following bills to third reading:

Senator Barnes' (410-469), providing that trout shall not be taken in Rensselaer county for the purpose of selling the same.

Senator Elon R. Brown's (475-926), making the close season for plover and other birds from Jan. 1 to Sept. 15, both inclusive, and providing further that plover shall not be possessed from Jan. 1 to Aug. 15, both inclusive.

Senator Le Fevre's (326-918), relative to the close season for quail in Schenectady, Dutchess, Orange and Ulster counties.

Other bills passed by the Senate are the following:

Assemblyman Contant's (389-979), allowing the use of tip-ups and set-lines in Ulster county in fishing through the ice.

Senator Ambler's (602-927), making the close season for gray squirrels in Dutchess county from Dec. 1 to Oct. 15, both inclusive.

Senator Le Fevre's (326-918), providing that there shall be no open season for quail in Schoharie county prior to 1906, no open season for grouse in Westchester county prior to 1905, nor in Dutchess county prior to 1907, and that in the latter county the close season for quail and woodcock shall be from Dec. 1 to

Oct. 15, both inclusive; and that there shall be no open season for woodcock, grouse and quail in Schenectady county prior to 1906.

The Assembly has passed the following bills:

Assemblyman Stevens' (982-1220), relative to special game protectors.

Assemblyman F. C. Wood's (950-1182), relative to the compensation of game protectors.

The Senate Game Committee has reported the following bills:

Assemblyman Wolff's (383-886), prohibiting all fishing except angling in Sheephead Bay and Rockaway Inlet, excepting in certain waters from Oct. 10 to Dec. 31, both inclusive.

Senate Forest, Fish and Game Committee's (668-873), relative to the prevention of forest fires. The bill has been restored to its place on third reading.

The Assembly Ways and Means Committee has reported the bill of Assemblyman Wood (1202-1618), relative to restocking the Adirondack region with wild beaver.

The Assembly Fish and Game Committee has reported the following bills:

Assemblyman Robinson's (1090-1416), prohibiting the placing of carp in Conesus and Hemlock lakes, Livingston county.

Assemblyman Denison's (1100-1455), prohibiting the taking of wildfowl in Black River Bay between sunset and daylight.

Senate Forest, Fish and Game Committee's (611-730), creating Catskill Park.

Assemblyman Pearson's (321-337) relative to taking fish through the ice in Sullivan and Greene counties.

A. C. A. National Meet, Sugar Island, Thousand Islands, St. Lawrence River, August 5-19, 1904.

### The Log of the Iris.

BY J. N. STALKER, DETROIT, MICH.

(Continued from page 261.)

The next morning the joy of living had returned to us, and we started out exuberantly for our twenty-eight mile paddle up the river to Port Huron. We had looked forward confidently to a wind that would enable us to sail, such as there is, nine days out of ten, but this morning a flat calm prevailed; and the river was as smooth as a mirror. It was delightful paddling, however, the sun comfortably warm and every fleecy cloud in the blue sky faithfully mirrored in the glassy water.

Sound was borne along the surface in a surprising way. We several times heard the spat spat of a gasoline launch when the boat itself was so far away as to be scarcely visible, and the sound of ordinary conversation reached us when carried on quite across the river. The continuous procession of big boats plying up and down the river was another interesting feature. We remembered with pride that no other water system in the world could show half the tonnage. There were the great steel five hundred footers, towering mountain-like above the surface of the water on the way up, or loaded deep on the way down, with their one or two consorts swinging majestically after them; the cigar-shaped whale-backs, with their cabins mounted on turrets and their decks

we had to keep ahead of them, but it really came hard. The way they hung on behind us, mile after mile, made us wonder if they had no homes. Then, just to find out whether we could do it or not, when they finally left us we kept up the same gait to the Black River where we were informed we could find a place to leave our boat. It was nine o'clock when we hauled her out, after a practically continuous paddle of twelve hours. The way we figured things out was like this:

Actual distance .....	28 miles
12 hours current at 6 miles per hour. . . . .	72 miles

Total .....

Those who do not accept these calculations may make others to suit themselves.

The next morning we were feeling disposed to peace and quiet, and concluded that we would try a permanent

to dream about. For perhaps five miles the beach is pretty well built up with cottages, which rather mar the artistic effect, but beyond them where we went, things were just as nature made them and delightful beyond description.

We finally selected the site for our camp, ten or twelve miles up the lake shore, pitched our tent, arranged our fire-place and got everything in order, and then set out to enjoy life. And enjoying life we certainly did. After a swim and a good large supper we lay down by the light of our camp-fire with our cigars and simply absorbed delight at every pore. The moon was near her full and throwing her soft shimmer to us for miles across the lake; back of us the pine trees, intoxicating us with their fragrance, lifted their picturesquely jagged outlines boldly against the starry sky. The woods were full of the night voices of their little inhabitants, whip-poorwill, treetoad, cricket, katydid, and many others, together with the soft sighing of the branches, while at our feet we heard the lazy, interminable wash, wash, wash, of the lake against the pebbles. Around us were our tent, canoe, and stores in snug array, and the blazing fire of driftwood crackling cheerily in the midst. It was too good to leave, and we lay there enjoying it until a disgraceful hour.

In the morning we were up betimes to go fishing—and such perch fishing! Lest anyone imagine that this account is too glowing, however, I will confess that we had our troubles catching minnows for bait. We had some mosquito netting which we got after our

Huron River.

Clinton River.

camp up on Lake Huron for the few days that remained of our vacations, and see how comfortable we could make ourselves. Going the way we had been our facilities for comfort were necessarily very limited. We accordingly laid in a good stock of canned goods, cooking utensils, fishing tackle, etc., in Port Huron, and with our gunwales very near the water started for the lake.

The current at the head of the river is appalling, but we managed to get out, and started coasting along the shore. We had never seen such clear water before in our lives. In one place where the bottom did not look a bit over six inches below the surface we found it about three feet, and a few moments later, when we judged it was about three feet deep, we could not touch bottom with our long double paddle. There was a slight breeze, so we soon hoisted our sail and moved along in the most enjoyable manner in the world, basking like crocodiles in the hot sun, which would have been uncomfortable but that our skins were by this time about the color and consistency of leather.

A finer beach than that above the city I believe does not exist—a gradually shelving shore covered with the cleanest, finest white sand you ever saw, back of which is a fringe of dark green pine-trees, diffusing the most fascinating fragrance under heaven, as is their nature; and then, stretching out to the horizon and throwing into bold relief the strip of pure white sand, the deep intense blue of the magnificent lake. Truly it is a place

At the Outlet of Lake Huron.

awash; the older wooden barges, many of them large and fine boats; an occasional passenger steamer, perhaps, tearing along at eighteen or twenty miles an hour and rolling up the great swells behind her; then smaller freight boats of every description, running all the way down to the forty or fifty foot tramp sailing schooner, some in the last stages of decay, and picking up a precarious livelihood as best they might.

The current was most distressing. We left Algonac at nine o'clock and did not reach Marine City, eight miles up stream until after twelve. This was hardly satisfactory, so we began to hug the shore as closely as possible, which we had not been doing, and paddle a little harder. We kept steadily at work all day without a stop, taking turns at lunch while the other man kept the boat going, until finally, about eight o'clock in the evening, we caught our first sight of the factory chimneys below Port Huron. A couple of men in a rowboat tried to pass us about this time, and for the honor of our craft

experience on the Snicardy, and we tied a string to each corner of this, and a stone and some bread in the middle and waded out. The middle, where the stone was, sank beautifully, but the edges all floated, so that in order to hold them down it was necessary to put our feet on the corners, much after the fashion of a ballet dancer doing the splits. Then of course our feet kept sinking deeper and deeper into the sand, so that we kept settling deeper and deeper into the water, which was icy cold—and the lower extremities of the elementary garment or so which we had donned for the occasion soon began to float artistically about us, on the surface of the water. In this position we waited for minnows. At length some came, and we made ready to haul up the net, but of course before we could extract a foot from the sand all the bait was in the next township. We tried this three times without a minnow, when we hit on the obvious scheme of planting the corners in the sand to hold them down and then attach-

ing long strings so that we could stand some distance off. In this way, by exercising some tact, we managed to get all we wanted. Of course if we had had netting enough for a seine it would have been very easy.

Once we had our bait, however, the fishing was all that we "could ask, or even think." Leaning over the side of the boat (one on each side, and carefully) we could see the fish twenty feet below us circle lazily around the hook and perhaps move off again, but in a minute they would be back, unable, especially if there were more than one, to long resist; then with a quick move, one of them would have seized the bait, and up he would come, a flapping beauty resplendent in white and gold. The number of fish we would pull up in the morning was regulated solely by the number we thought we could use, and no fisherman need be told that under the circumstances we estimated our capacity rather largely.

And then such splendid fish they were, too, firm and sweet and white, and when fried in butter and cornmeal, and accompanied by new potatoes borrowed for the

Along the Beach—Lake Huron.

occasion, and baked in the ashes, they made a meal the very remembrance of which makes my mouth still water. Our meals were generally sandy, it is true, and sometimes the worse for inexpert cooking, but never were meals enjoyed more or digested better, though the cook of the hour might occasionally hear a few caustic comments if he listened. For instance, the L.L.D., when engaged in making cornmeal mush one morning, despite my urgent appeals, refused to stir it, stating that that was not necessary. Of course he would have been pretty well blistered up, because the fire was hot, but that was part of the job, that was all. Well, the mush when served had a decidedly burnt taste, and there was perhaps half an inch of it stuck in the bottom of the pan, but it *wasn't burnt*. Oh, no! The stuff in the bottom of the pan was not explained, but the peculiar taste was caused by smoke which ventured over the top of the pan, fell in, and became incorporated in the mush. That is still the official explanation, because you might as well argue with the Washington Monument as with the L.L.D. He has besides a number of foolish tales, which he tells on all occasions, about me, but they are untrue, and not worth repeating anyway.

The days passed like a fairy story, upon that beach. We had nothing to do but get our meals and amuse ourselves. With our meals we were by this time succeeding gorgeously, with wild raspberries in profusion, new potatoes very accessible, and fresh perch in unlimited quantities—besides these we had, of course, our staples, and an extra supply of canned goods from Port Huron. Amusing ourselves required very little trouble. Fishing was, of course, great fun, but we listed that as part of the not very strenuous struggle for existence. Aside from that we spent most of our time swimming, and then lying flat on our backs in the shade and talking, thinking or dozing as we happened to feel like. We had been paddling pretty hard and steadily for the preceding ten days, and a little loafing and good living just seemed to suit.

One afternoon we paddled down to the life-saving station and made a very pleasant little call there, looking over their apparatus and swapping yarns. In the course of our stay a couple of the men wanted to try the canoe. The first came out all right, as was expected, but the second, a man rather given to talking of his own achievements, past, present and future, was not so fortunate. With a lordly wave of the hand, indicating the way in which it *should* be done, he got in and seated himself on the deck the way he had seen the present scribe doing. He had not gone thirty feet before the boat gave a spasmodic tip, and the next instant there was nothing to be seen of him but a wild flapping of arms, legs and paddles in the water, while the "old hand" recovered from his surprise enough to cough the water out of his lungs and tow the boat ashore. The delight of our hosts—our other hosts, that is—positively knew no bounds, and to add to the general good feeling I went down and took a picture of the returning hero as he crawled disgustedly out on the little dock. I happened to know exactly how he felt, but did not mention the fact.

On our way back there was not a breath of air stirring and the lake was as flat as a mirror, so that, the light being right, we were able to see the bottom with as much distinctness, apparently, as if there were no water between us and it. This gave us an almost uncanny feeling, as though we were travelling in an airship. The ground would rise and fall, now rough, now smooth, below us, and we would glide along above as if supported by wings. I have a number of times traveled over water so clear that the bottom was distinctly visible, but never before had an illusion of that sort borne upon me so strongly.

That night we made the acquaintance of the most zealous creature I ever knew. It was a whippoorwill, and in this tired blasé world it did us good to know

him. He had found his work. I think he repeated his vocabulary of one word a hundred thousand times at the very least that night, and that without abating one jot or tittle of his ardor. Each repetition was just as fresh, just as enthusiastic, just as replete with satisfaction to himself, as the first. We were sorry we couldn't feel the same about it as he did.

After three days of this tranquil camp life our time was up and we had to go back. We were anxious to finish in style, however, and determined to make the sixty-mile run from Port Huron down to Detroit, where our cruise would terminate, in one day. That was with the understanding, however, that we would not attempt to cross Lake St. Clair if it looked stormy. It is a treacherous little lake at best, and to get caught in a canoe by a squall when five or ten miles from shore would mean simply a question of obituaries. We accordingly, with some pangs at being obliged to leave, packed up and paddled down to Port Huron, where we made arrangements for our tent, sail, blankets and heavier stuff to go down by steamer, and left our canoe in the warehouse on the dock.

The next day was Sunday (we had figured our time pretty close) and we were disappointed to learn that we could not get the canoe before seven o'clock; however, as matters turned out, we could not get any breakfast in time for an earlier start, so that it didn't matter.

At seven o'clock, accordingly, we started, and a fresher, clearer day I have never seen. We had but one grievance, the wind. The day before it had been blowing right down stream, but, as we expected, it veered completely around in the night and blew dead against us all day. If the wind did make traveling harder, though, it supplied us with fresh, pure ozone in unlimited quantities, and the first thirty miles or so, from Port Huron down to the Flats, were certainly delightful.

We came down mile after mile, working easily but steadily, past the familiar spots we had remarked on our way up, but this time keeping to the middle of the river as if we owned it, and allowing the right of way to the up-coming barges simply through the courtesy that flowed from our superabundant good humor. We reached Algonac, twenty-eight miles down the river, at a trifle after eleven o'clock, still as fresh as daisies, for we were saving ourselves for our run across the lake. Our lunch we brought with us and ate in the boat, one of us paddling while the other ate. The paddling under those conditions is something of a bore, but the eating lunch is great. We very soon reached the Flats, after passing the two or three miles of summer cottages that extend up into the St. Clair river. At one of these it required a colossal draft upon our resolution to proceed without a stop, the attraction being a couple of charming girls in swimming who, we imagined, looked lonesome. The fact that we were looking frightfully tough was another factor in the case, not without weight, in enabling us to adhere to our determination.

Then came the numerous fine club houses and hotels, and after them the famous ship canal. The latter is a channel dredged for two miles through the shallows of the lake, and protected by embankments thrown up on either side from the encroachments of the continually changing shoals.

Once through that and we were ready for our eighteen-mile trip across the lake. After a careful and dutiful inspection of the weather we decided that it was safe, wriggled ourselves into as comfortable positions as we could, and started. Far away to our right was visible a black line which indicated the American shore, but ahead of us, and to our left, there was nothing in sight but water, and the smoke of an occasional distant steamer. We started off at a good gait and as happy as larks, expecting to be in Detroit by four or five o'clock. Had we known that we had seven hours more of hard paddling ahead of us our spirits might have ebbed a little.

The wind, which had not been seriously annoying on the river, began to bother us on the lake, and at half-past four we were still three or four miles farther out in the lake than Grosse Pointe. By this time we could make very little headway at all against the wind, the whitecaps bunting against the bow of the boat in tireless succession, then breaking on the forward deck and dumping the overflow into the cockpit. It required three hours of the hardest kind of work to make the next five miles. Solid work of that sort came hard, too, for we were more tired than we thought, and as far as simple bodily comfort went it would have been preferable to be blown out into the lake and drowned to forcing our aching muscles to any further exertion. We were opposed to dying on principle and for other reasons, however, and the wind mercifully died down about half-past seven, so that we reached Detroit safely an hour later, still alive, but very tired indeed. We had not stirred from the canoe for thirteen and a half hours, and had been paddling all that time, for over three hours using the utmost of our strength.

However, "All's well that ends well," if our sixty-mile trip did come harder than it should, and after we had tipped out the water, of which we had shipped over two painfals, and got home to bed, we were ready to make plans for the next year's outing.

We were several shades darker than mulattoes when we got back, and some of our lady friends stated that they had *once* considered us good-looking, with emphasis on the past tense, but we have hopes of eventually regaining our Caucasian hue. Physically, the trip gave us a new lease of life, and you may be sure that two weeks of primitive life next to broad, sweet, simple nature left a beneficial impress somewhere on our characters.

### Special Cruising Class Canoe.

LAST year Mr. Daniel B. Goodsell and two members of the New York C. C. built special cruising class canoes. The plans of these boats appeared in *FOREST AND STREAM* of Feb. 7, 1903, and we give herewith a photograph of Mr. Goodsell's boat under sail.

The A. C. A. made provisions for this class at a meeting held last year.

The boats were put together by W. F. Stevens, of Bath, Maine, known as the most expert builder of

racing canoes in America. They cost, complete, a bit under \$125.

The hull is straight sided with rounded bottom and deck. An underbody rudder is used instead of the old style hung to the stern post. The boats can be rowed or paddled, although distinctly built for racing purposes. A leg-o-motton mainsail and small jib are used, the latter being rigged to boom out and act as spinnaker.

The boats are 17ft. over all and 42in. breadth. They

Special Cruising Class Canoe.—Owned by D. B. Goodsell.

will draw 5in. With the board down the draft is 3ft. The hull will weigh 200 pounds. The total displacement with crew of one aboard is about 510 pounds. Hollow spars will be used. They carry about 135ft. of sail.

The canoes are painted on the outside, except the top strake, which is varnished. Each boat is fitted with water-tight compartments, making it non-sinkable. The straight features of the sides and the cockpit arrangements make it almost impossible to fill the craft, even though the sail be lying flat in the water. A zinc dagger centerboard of the Linton Hope type, weighing 65 pounds, will be used. A feature of the boat is three feet clear cockpit space aft of the centerboard trunk.

### Officers of A. C. A., 1904.

Commodore—C. F. Wolters, 14 Main St. E., Rochester, N. Y.  
Secretary-Treasurer—John Sears Wright, 519 West Ave., Rochester, N. Y.

#### ATLANTIC DIVISION.

Vice-Commodore—L. C. Kretzmer, L. C. Schepp Building, New York.  
Rear-Commodore—W. A. Furman, 846 Berkeley Ave., Trenton, N. J.  
Purser—M. Ohlmeyer, Jr., 201 Palisade Ave., West Hoboken, N. J.  
Executive Committee—H. L. Pollard, 138 Front St., New York; N. S. Hyatt, Ossining, N. Y.; H. C. Allen, 54 Prospect St., Trenton, N. J.  
Board of Governors—R. J. Wilkin, 164 Montague St., Brooklyn, N. Y.  
Racing Board—H. L. Quick, Yonkers, N. Y.

#### CENTRAL DIVISION.

Vice-Commodore—H. W. Breitenstein, 511 Market St., Pittsburg, Pa.  
Rear-Commodore—Frank D. Wood, Buffalo, N. Y.  
Purser—Frank C. Demmler, 526 Smithfield St., Pittsburg, Pa.  
Executive Committee—Jesse J. Armstrong, Rome, N. Y.; H. C. Hoyt, 26 S. Goodman St., Rochester, N. Y.  
Board of Governors—C. P. Forbush, 164 Crescent Ave., Buffalo, N. Y.  
Racing Board—Harry M. Stewart, 85 Main St., East, Rochester, N. Y.

#### EASTERN DIVISION.

Vice-Commodore—Henri Schaeffer, Manchester, N. H.  
Rear-Commodore—H. M. S. Aiken, 45 Milk St., Boston, Mass.  
Purser—Edw. B. Stearns, Manchester, N. H.  
Executive Committee—B. F. Jacobs, Jr., West Medford, Mass.; D. S. Pratt, Jr., Wellesley Hills, Mass.; Marcus Butler, Lawrence, Mass.; William W. Crosby, Woburn, Mass.  
Board of Governors—Paul Butler, U. S. Cartridge Co., Lowell, Mass.  
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; H. D. Murphy, alternate.

#### NORTHERN DIVISION.

Vice-Commodore—Chas. W. McLean, 303 St. James St., Montreal, Canada.  
Rear-Commodore—J. W. Sparrow, Toronto.  
Purser—J. V. Nutter, Montreal, Canada.  
Executive Committee—C. E. Britton, Gananoque, Ont.; Harry Page, Toronto.  
Board of Governors—J. N. MacKendrick, Galt, Ont.  
Racing Board—E. J. Minet, 125 Vitre St., Montreal, Canada.

#### WESTERN DIVISION.

Vice-Commodore—Burton D. Munhall, care of Brooks Household Art Co., Cleveland, O.  
Rear-Commodore—Chas. J. Stedman, National Lafayette Bank, Cincinnati, O.  
Purser—Geo. A. Hall, care of Bank of Commerce, Cleveland, O.  
Executive Committee—Thos. P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O.  
Board of Governors—Henry C. Morse, Peoria, Ill.

### How to Join the A. C. A.

From Chapter I, Section 1, of the by-laws of the A. C. A.:  
"Application for membership shall be made to the Division Purser, and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

*All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.*

### Interlake Yachting Letter.

CLEVELAND, OHIO, March 26.—The one or two warm days during the past two weeks have reminded the yachtsmen that it is time to be up and be doing, and accordingly the work of fitting out has become noticeable all along the line, while more orders for new are still being placed.

In Buffalo, aside from Mr. Sumner Hayward's big yawl, Dr. E. P. Hussey's yawl, two 21-footers, and an 18-footer, the new 15-foot one design class are attracting considerable attention, and last week another boat was ordered. The new class starts out with five boats in all, which are being built by Weir, of Hamilton, Ont. The Buffalo Y. C. is having a new defender built for the Ryan Cup, by Messrs. Strong and Patterson, which is almost completed. She is a trim little craft and is expected to keep the cup for the club. The Canoe Club is building a challenger which is now being planked. Mr. James Johnson may purchase Beaver, the one time defender of the Canada's Cup. There is some talk of a syndicate building a restricted 21-footer to challenge for the Lipton Cup, at Chicago, and the prospective owners are now considering several designs.

Erie yachtsmen are building a boat for the 21ft. restricted class that will be tried out, and if her showing is such as to indicate her candidacy for the cup races, will also be shipped to Chicago and entered in the races. Several other small boats have been built at this place, and the yachtsmen are looking forth to a successful season. In a letter to the writer, Mr. W. H. F. Nick states that fitting out has begun in earnest and the fleet will be in commission fully two weeks earlier this spring than at any time heretofore. Commodore Geo. T. Bliss, former commodore of the Erie Y. C., is in Honolulu, where he has been spending the winter, and will not return till the sailing season is on.

Another new boat has just been discovered. She is for a Cleveland yachtsman, and is being built at Toledo by Joe Hepburn for Mr. R. L. Lockwood, and is for the new 16ft. restricted class recently adopted by the Detroit Y. C. The craft is about completed, and for her over all length has a wonderful amount of room, both above and below decks. Her general dimensions are as follows: Over all, 28ft. 2in.; water line, 16ft.; breadth, 6ft. 10in.; draft, 20in. She has 4ft. headroom in her cabin, which is 6ft. in length. The yawl for Dr. N. W. Brown is finished, and waiting for the ice to leave the river, when she will be launched. Mr. H. S. Watterson's 18-footer is nearly completed. In a recent freshet Chloris, with a number of other boats, were seriously damaged, and two completely destroyed. Fresh water yachtsmen will be sorry to learn that Commodore Geo. Worthington will not fit out the Priscilla this season, as her owner is going to Europe.

The Lakewood Y. C., of Cleveland, held its annual election on Friday evening, March 11, at its city rooms in the Arcade. The following were elected: Com., A. J. Phelps; Vice-Com., Henry D. Whiton; Rear-Com., Warren J. Brodie; Sec'y-Treas., C. O. Peterson; Fleet-Captain, Geo. Gerlach; Fleet Surgeon, Dr. R. H. Singleton; Directors, F. W. Wakefield, Myron B. Vorce and Robt. E. Powers. Through a discussion the office of measurer was left open and the vacancy will be filled at a meeting of the board of directors. Two new boats are being built at Sandusky, one for Donahue Bros., and the other for a gentleman who wished his name withheld. At the annual election held some time ago, Mr. Lockwood was elected commodore, but for personal reasons resigned, and at a meeting of the board of directors Mr. Wm. F. Seitz, former secretary of the Inter-Lake Y. A., was appointed his successor.

The club house of the Toledo Y. C. came very nearly being destroyed by fire recently, and had it not been for prompt action on the part of the yachtsmen they would be homeless to-day. As it is, so much damage was done that will mount up in the thousands to again place the handsome structure in its former condition.

Detroit is by all odds the busiest yachting center on the lakes, and each day brings news of new boats building; in fact orders are being placed so rapidly that it is almost impossible to keep track of them. Nine or ten boats are building for the 21ft. restricted class to compete for the Walker Trophy, and also for the Lipton Trophy, at Chicago. The last to get in the game is Mr. H. T. Schmidt, a member of the Detroit Y. C. His boat was designed by her builder, a Mr. Parker, of Marine City, Mich. He is a new man in the field, and little can be said of the boat. Mr. Schmidt, however, is of the opinion that the boat will be a hummer. One thing is certain. The 21-footers will be the most popular class on fresh water the coming season, and will have things pretty much their own way. Mr. Geo. Wilds has gotten out the lines of a boat for this class, and it is more than probable that a boat will be built, though who the owner will be is a question. Those who are acquainted with Mr. Wilds know that when he tries his hand that something will happen. He designs very few boats, but those who are familiar with Detroit, of Canada Cup fame, know that he is a practical designer, and his boats always combine extreme speed with good wholesome construction, and can go through

a season's hard work without a scratch, and with prizes galore.

Cadillac, one-time defender of the Canada's Cup, has been sold, and Detroit yachtsmen are happy, not because she was sold, but because she was sold in Detroit, and is to remain in that city, and will continue her battles with Detroit the coming season. Cadillac was placed on the for sale market through the death of her owner, the late Mr. Warren. Mr. Harry C. Kendall, of the old Shamrock fame, came to the front at the head of a syndicate and purchased the boat. Mr. Kendall is one of the ablest skippers on the lakes, and he has associated with him one of the best Corinthian crews on fresh water, all of which are part owners.

C. W. SCHMIDT, JR.

### Southern Letter.

ALL the hundreds of bodies of water discharge into the Gulf of Mexico along the shores of Louisiana, Mississippi and Alabama, with their semi-tropical and various other attractions, are ideally picturesque; and, as it is convenient to poke in and out of their openings to the sea when voyaging along these shores, they hold no end of interest and enjoyment for yachtsmen. On this coast there are no rock-bound shores, and very little of tide or current, the greatest rise of water in the tributary streams being when the wind blows from the Gulf backing the sea-water up a foot or so, and making the waters for miles up-stream salty, with a beneficial effect upon marshy places. The Mississippi River at New Orleans, 100 miles from its mouth, is at times quite salty at certain seasons of the year, and when the winds are from a southerly direction for some days at a time, and fish which live only in salt water come up the river that far and are often caught in front of the Crescent City. Generally speaking the river is to the west, the south and to the east of the city, and then it bends away to the Gulf. The Gulf curves up into the state so that to the east of the city it is not half the distance to the sea that it is in going down the river, and an arm of the Gulf comes in to the north of New Orleans, within the city's bounds, that is brackish water the year round.

It is upon this body of water that the yachtsmen of New Orleans do their sailing, and not upon the Mississippi River, as many suppose. Lake Pontchartrain, as it is called, is 22 miles wide and 40 miles long. The club house of the Southern Y. C. is situated upon its southern shore in the northern suburb of the metropolis of the South, and it is only 7 miles across the city from the river bank to the shore of the Lake. There are two navigable canals which stretch from the lake to the very heart of the city, but which do not connect with the river, while a third one ten miles below the city connects the river with the Gulf and shortens the distance out to the Gulf by 50 miles or more.

Coming along the Gulf of Mexico from the eastward to Mississippi Sound, the course is to the southwest into the land, where the sound ends in a bay known as Lake Borgne. At the western end of the latter is a narrow and deep passage, called The Rigolets, which connects with Lake Pontchartrain, and to the westward still further is another large body of water, which was also at one time, so science says, a part of the Gulf; this is Lake Maurepas, and the salt water backs up into it from Pontchartrain through Pass Manchak, owing to the influence of tide and wind.

Lake Pontchartrain is the largest of the three lakes. It has several fine resorts along its shores, and a uniform depth of about 18 feet of water. There is probably not a better sheet of water anywhere for yacht cruising and racing. The club house of the Southern Y. C., its racing course and yacht anchorage are very advantageously situated at West End, "the Coney Island of the South," and while there are there all the adjuncts of a place of that character, including Ferris wheels, flying-horses, roller-coasters, places of wonder *ad lib.*, its chief attractions are the water, the yachts, yacht-club house, rowing-boat clubs, the bathing and the fishing. The Southern Y. C. anchorage basin, or "the Pen," as it is called, is landlocked, and it is reached by means of a canal. In front of the club house, which is built out in the lake on spiling, the club has a 5-mile triangular course buoyed off, which is sailed around twice, or 10 miles in all. The canal, which extends back through the city for 5 miles, straight away, affords a splendid course for the racing of small motor boats in smooth water.

As to the premier yacht club of the South, all the yachting world knows that the Southern Y. C. is, next to the New York Y. C., the oldest organization of the kind in the country. It was organized in the year 1849, and it is therefore in the fifty-fifth year of its activity. It has a membership of over 750, and a large and growing fleet. The club is now occupying the third club house in its history, the present building having been erected three years ago. Last April there was a fire at "the Pen" which destroyed 29 yachts and a number of boat houses. Now the club is just finishing a new anchorage at a cost of \$10,000, around which all the houses (they are used for storing

of yachts and yacht paraphernalia) must be built of fire-proof material—that is, sheathed with galvanized iron. Part of the outfit at the anchorage includes excellent hauling-out ways, with switches over which trucks may be run, so that half a dozen yachts may be out at a time, a crane for handling spars and a large warehouse for the use of the members, where may be stored the sails, spars, dinghies and any and all furnishings and fittings of those who do not own their own boat houses, the general idea being that the club will give every possible encouragement to the younger yachting element in particular, so far as the cost of maintaining their craft goes, there being no charge for the use of these accessories.

The dues for membership in the Southern Y. C. are very low compared with other clubs, the sum being \$12 annually, and the initiation fee is only \$10, and the latter has been suspended for some months. The club is extremely well off financially, and between \$9,000 and \$10,000 are spent every year for the encouragement of the sport of yachting. The club has a paid secretary, a steward, porters and a "pen," or anchorage keeper. There are in the club house sleeping apartments affording accommodations for upward of a hundred members, many of whom lodge there, over the lake waters, during the months of summer. In a season the Southern Y. C. holds half a dozen or more regattas and several dances and entertainments. In fact no stone is left unturned by the officers and committees to foster the sport and to amuse and entertain the club's membership, which "all hands and the cook" will endeavor to bring up to the one thousand mark for the season of 1904-05.

L. D. SAMPSELL.

### Arrow's Record, 1903.

THE 18ft. knockabout Arrow was designed by E. A. Boardman, naval architect and yacht broker, Boston, Mass., and raced by E. A. and R. D. Boardman last summer in Massachusetts Bay.

Arrow proved to be the best boat in the fleet, finishing first, fifteen times; second, five times; third, once; fourth, four times; one breakdown, and withdrawing

ARROW.

Photo by Willard B. Jackson, Marblehead.

once when in leading position, on account of rounding wrong mark.

She won the Corinthian Championship at Marblehead, five firsts in five starts. The Corinthian mid-summer series, which are the largest series at Marblehead.

She won four firsts in four starts on the North Shore circuit of Y. M. R. A. races, leading in M. Y. R. A. percentage at the end of this series, but withdrew from M. Y. R. A. races as it was impossible to follow the South Shore circuit.

Chance, another 18-ft., designed by Mr. Boardman, won the mid-summer series of races for the Lawson cup, of the Boston Y. C., at Hull, Mass. Arrow did not start in this series, on account of losing her mast just before the first one.

LINE, INBOARD PROFILE, DECK AND CABIN PLANS OF THE BARGE OPAL—DESIGNED FOR THE IMPERIAL RUSSIAN GOVERNMENT BY GEORGE SIMPSON.

### Imperial Russian Steam Barge Opal.

THIS handsome barge was constructed for the Imperial Russian Government for the use of Admiral Alexieff, the commander-in-chief at Port Arthur, and diagonally built of mahogany from the designs of Mr. George Simpson, superintending constructor to the Townsend-Downey Shipbuilding Company.

Opal's dimensions are as follows:

Length—	
Over all	71ft. 9in.
Between perpendiculars	64ft.
Freeboard—	
Forward	5ft. 5in.
Least	3ft.
Taffrail	3ft. 10in.
Breadth—	
Moulded	10ft.
Draft of hull—	
Extreme	5ft. 1in.
Depth—	
Moulded	5ft. 8in.
Tonnage—	
B. O. M.	30.

The barge is built of wood throughout, excepting the water-tight bulkheads and the machinery casing, which are of galvanized mild steel, suitably stiffened. Shell planking is of mahogany, the inner thickness being laid diagonally, and the outer fore and aft, with thin calico between. Deck houses are of teak, tastefully paneled, and the deck is fitted in two thicknesses, the upper one being of teak wood.

The whole of the deck fittings were of polished composition, and the interior work is luxuriously finished. Outside the barge presented a striking appearance with white boot-top and navy blue topsides, having a gold band carried around at knuckle moulding, terminating in artistic scroll and quarter carving enveloping the Russian coat of arms.

The propelling power consisted of a water tube boiler, supplying steam to a compound engine, having cylinders 8½in. and 18in. in diameter, with a 9in. stroke, capable of developing 300 I. H. P. This power was sufficient to propel the barge, fully loaded, at a rate of 20 miles per hour.

### A 65ft. House Boat.

THERE was launched a short time ago a 65ft. power house boat from the yard of the Wilson Shipbuilding Co., Ferry Bar, Baltimore, Md. She was designed by Captain Leonard J. Nilson, and for use on Chesapeake Bay. The boat is 65ft. long, 16ft. breadth and 3ft. 4in. draft. Her power consists of a 15 horsepower motor. A long cabin house runs nearly the length of the vessel, and there is little deck room forward and aft. The top of the cabin house is used as a promenade deck, and it is entirely covered with an awning.

The owner's room is in the forward end of the house. It contains a double bed and locker to starboard and a single berth with drawers to port. The forward end of the compartment is used for drawers, sideboard, lockers and lounging seat. Beside the owner's stateroom on the port side is the bathroom. Aft of the bathroom and a storeroom on the other side of the passageway are two more staterooms. These are fitted with double berths, bureaus, lockers, shelves and divans. Aft of these staterooms is the main saloon, a commodious apartment fitted up with sofas, buffet, sideboard, writing desk, book shelves and china lockers.

The galley, engine room, cook's stateroom, toilet, ice chest, gas stove and sink occupy the stern of the house. The gasoline tanks are located under the after deck. The boat is to be run with only one paid hand.

### New York Y. C.

THE second general meeting of the New York Y. C. was held at the club house in West Forty-fourth street on the evening of March 24. In the absence of Commodore Bourne, Vice-Commodore Henry Walters presided. Much important business was transacted, and it was very late before the meeting adjourned.

Modifications and changes were made to the constitution, by-laws and racing rules, and reports of different committees were read.

The letter sent to Sir Thomas Lipton was read, but its contents will not be made public until after it has been received.

Mr. F. F. Brewster sent a letter to the club in which he explained why Elmina was not measured last season. Through this oversight Mr. Brewster forfeits all the prizes won by his yacht.

The Astor cup, won by Mr. Morton F. Plant last season, was presented to the club to be placed among its permanent trophies. Mr. Plant also prevented to the club another cup to be raced for by schooners in Class B during the cruise.

It was decided to invite boats of the Eastern Y. C. to join the New York Y. C. fleet at Vineyard Haven, and participate in the races that follow.

The regatta committee gave out its schedule for the coming season. The fixtures follow: Thursday, June 16, annual regatta, Lower Bay; Saturday, June 18, Lysistrata Cup, Sandy Hook Lightship; Monday, June 20, opening club station, Glen Cove; special races for yachts owned by members too small for enrollment, and motor boat races, Glen Cove; Tuesday, June 21, Glen Cove Cups, Glen Cove; Thursday, July 7, Friday, July 8, and Saturday, July 9, Glen Cove series, Glen Cove.

Thursday, August 11, special races for yachts owned by members but too small for enrollment and motor boat races, Glen Cove; Thursday, August 11, rendezvous annual cruise; Friday, August 12, cruise to Morris Cove; Saturday, August 13, cruise to New London; Sunday,

August 14, at New London; Monday, August 15, cruise to Block Island; Tuesday, August 16, cruise to Vineyard Haven; Wednesday, August 17, cruise to Newport; Thursday, August 18, special races for yachts owned by members but too small for enrollment, and motor races, Newport; Friday, August 19, Astor cups, Newport; Saturday, August 20, 10 A. M., start of ocean races to Nantucket Lightship, Fire Island Lightship and return Brenton's Reef; Saturday, August 20, 2 P. M., steam yacht races, Hauli cups, Brenton's Reef Lightship; Monday, Tuesday and Wednesday, August 22, 23 and 24, Newport series, Newport, and Thursday, September 8, Autumn cups, Glen Cove.

The Brenton Reef Challenge Cup, Sandy Hook Lightship to Brenton Reef Lightship, Newport, R. I., and return is open for competition, and on the receipt of entries the committee will arrange for the races.

### One Hundred and Sixteen Mile Race for Small Boats.

THE New York Athletic Club is bringing itself into prominence as a yachting organization by offering prizes for small yachts for a race from Whortleberry Island, located at the western end of Long Island Sound, to West Harbor, Block Island, a distance of over one hundred miles. The conditions governing the race follow:

The yachts eligible are to be propelled by sails only. Must be not more than 30ft. 6in. waterline, or more than 43ft. over all. If keel boats, they shall have not less than 5ft. 8in. head room in the cabin, for a distance of 6ft. fore and aft. If centerboard boats, they shall have not less than 5ft. head room in the cabin for a distance of 6ft. fore and aft.

Yachts will be considered in cruising trim when they carry a boat, two anchors and cables, a life preserver, regulation lights, and their cabin furniture and water tanks in their usual places, and not otherwise. No restrictions as to sail carried, any rig, and no time allowance. Yachts will carry their club colors at the main truck. The crew of each yacht shall number not more than five persons in all, one of whom may be a paid hand.

As this race is given with the object of bringing together the best types of small cruising yachts, the committee reserve the right to refuse any entry which in their opinion does not comply with the spirit of these restrictions. Owners wishing to enter their yachts for this race will send their club measurer's certificate that the yacht so entered qualifies to said measurements.

The race will be started from a line between the N. Y. A. C. house on the east side of Whortleberry Island, and the striped buoy on the southerly end of Green's Flats, and will finish at the entrance to the west harbor of Block Island. Yachts can go through Plumb Gut, the Race, or Fisher's Island Sound, and may anchor, but must be sailed on the channel side of all buoys and Government marks.

The start: Preparatory signal at 10 o'clock, one long whistle from club launch and the lowering of club flag. Ten minutes later, one long whistle from club launch and hoisting of the club flag, when the time of all boats will be taken, no handicap.

The race is open to the boats of the clubs of the Yacht Racing Association of Long Island Sound, the New York Y. C., the Atlantic Y. C., and the Larchmont Y. C. There will be a second prize if three boats finish. The event is to be started on Saturday, June 25. Entries close a week before that day with the New York Athletic Club Yachting Committee, Pelham Manor, N. Y.

## Gas Engines and Launches.

BY F. K. GRAIN.

### The Cylinder.

(Continued from page 195.)

THESE engines will invariably cause trouble by cramping the piston, through the excessive pressure, against the wide walls of the cylinder, and also need excessive lubrication.

### Piston and Rings.

The piston now takes our attention, this part being, of course, what the novice would call the plug, that slides up and down in the cylinder. In the steam engine, the piston is a shallow disc, but in the bulk of gas engines the piston is what is called the trunk type, being usually from one and a quarter to one and a half times its diameter in length. As the fit of the piston in the gas engine cylinder controls to a great extent the degree of compression, it should be very carefully fitted and should be on the smallest engines not over five thousandths of an inch smaller than the bore when new. In grooves turned out of this piston there is usually placed three packing or piston rings, in most cases two at the top and one at the bottom. These rings are of cast iron, varying from one-quarter to three-quarters of an inch in depth and turned eccentric, being, say, one-quarter of an inch thick on one side and on the opposite side of the circle coming down to one-eighth of an inch, where they are divided by being cut cross-wise at an angle of 90 per cent, or cut out in steps; this allows the ring, which has been turned slightly larger than the bore of the cylinder, to be compressed when inserted, making it a spring ring.

In addition to these spring rings it is now the universal practice to turn several annular grooves around the piston. These act as an oil packing, and also help to keep the lubricant circulated around the piston. In some cases the groove is turned also in the ring, but we do not approve of this plan as it takes out too much of the metal on the thin side where the rings are turned eccentric.

### Fly Wheels.

Fly wheels on the majority of marine engines of the two-cycle type are generally made of the web pattern, that is, without spokes. The web should be as light as possible, consistent with strength in order to throw all the available weight on the rim of the wheel. The usual practice is to make the diameter of the fly wheel about three times the length of the stroke; the weight should equal the weight of the cylinder, which if properly designed will give the right proportions.

### Coupling and Thrust Bearing.

On the opposite end of the crank shaft from the fly wheel, we have the shaft coupling and thrust bearing. In order to form the thrust bearing, which is intended to take up the thrust or push from the propeller, the general practice is to insert a number of balls fitted in a cage between the couplings and the after bearing of the engine, or in a great many cases a groove is turned in the coupling for a ball race, the opposite side being a flat, hardened steel washer. While this, theoretically and to all appearances, is a very neat and effective arrangement, we have found from actual experience that ball-bearings in marine work are not a success, especially if they are not properly adjusted and carefully looked after, which is most generally the case. The old-fashioned method, and one still employed on large marine work, is the ring thrust, composed of a collar with a number of rings which mesh into a block fastened to the keelson entirely separate from the engine. The importance of a good thrust bearing, we are sorry to say, is sadly neglected by the launch owner, as a bearing of proper design, if carefully looked after, will in the majority of cases add from twenty-five to fifty revolutions a minute to the average engine, and not only keep the engine in a much better and freer working order and save a good deal of wear, but in many cases prevent a broken connecting rod, the latter in many cases being broken by the thrust crowding the connecting rod forward and, of course, cramping the entire machine.

### Circulating Pumps.

Circulating pumps, used to circulate the water through the water jacket, are in a great many cases of insufficient capacity. While in cold weather when the water is cool it is sometimes advisable to shut off a part of the water supply; of course, the majority of engines being used in the warm months when the water is warm, we often hear of cases of over-heating. Most marine engines are placed as low as possible in the boat and generally exposed to the heat of the sun, which, owing to their being protected by the sides of the boat, they get the full force of it and are not benefited by any draught, consequently, more liable to heat. The pump should have a check valve on both the inlet and discharge side, these checks being placed as close to the pump as possible, as, of course, the pump is depending upon forming a partial vacuum to do its work. On some engine we find the discharge check placed anywhere, on the piping of the cylinder in place of an elbow. This is bad practice, and invariably leads to a poor working pump. Of course, all pumps on two-cycle engines have an impulse at every revolution of the engine. This is unavoidable, although it is mechanically very bad practice, as the average marine engine will make about 500 revolutions per minute, and any plunger pump loses its efficiency above a speed of 200 strokes per minute.

This is one reason why in practice these pumps give such an irregular circulation. Of course, the remedy would be to gear the pump so that the engine would make about four revolutions to one of the pump and increase the size of the pump. This would add considerably to the cost of any engine, and unfortunately, it is one of these points that the average launch owner is not willing to pay for.

### Vaporizers

Vaporizers are now so universally employed for gen-

erating the gas that it is hardly worth while to mention any other device. The carbureters, pump, feed by direct injection, and all other devices being practically out of date. There is very little difference in the operation of any of the different styles of vaporizers, they being all of the same principle which is that of the ordinary check valve, the gasoline being admitted through a small opening directly under the seat of the valve and being controlled by a needle valve. In operation the vacuum of the crank case lifting the valve admits air, at the same time the valve lifts to admit the air it also uncovers the inlet of the gasoline. The gasoline then striking the air is mixed or vaporized into an explosive mixture of gas. This gas, however, will not produce a destructive explosion until confined in the cylinder and then compressed. The usual practice is to make the air inlet of the vaporizer of the right proportion without necessity of adjustment, the gasoline being adjusted to suit the constant air supply. Constant, level and float feed vaporizers, widely advertised for automobile purposes, are not adapted for marine work.

[TO BE CONTINUED.]

## Boston Letter.

BOSTON, March 28.—At the annual meeting of the Y. R. A. of Massachusetts, held at the town house of the Boston Y. C., it was decided to adopt the recently formed class of 30-footers. This class will be known as Class H, yachts conforming to the limitations of the Massachusetts Thirty-foot Cruising Yacht Association. From the opinions expressed prior to this meeting, it was understood that some opposition to the adoption of the class would be raised. There was considerable discussion in regard to the matter and a vote upon the question was not reached until after many arguments had been made. The vote resulted in 15 for adoption and 4 against. There are three boats building for the class. One of these is from designs by Messrs. Burgess and Packard, for Mr. T. K. Lothrop, Jr., and is being built under the designers' supervision at Beverly. The other two are being built by the Herreshoffs, one for Mr. F. G. Macomber, Jr., and the other for Mr. S. Reed Anthony. It is unlikely that any other boats will be built for the class this season.

Although racing dates had been assigned to many of the Y. R. A. clubs at a conference held a week previous to the association meeting, the final arrangements of dates for open races was not made until the meeting was held. There were some additions and changes, and the final schedule of Y. R. A. open races now remains as follows:

May 30, Monday—South Boston, City Point.  
June 17, Friday—Boston, Hull.  
June 18, Saturday—Squantum, Quincy Bay.  
July 16, Saturday—Winthrop, Winthrop.  
July 27, Wednesday—Boston, midsummer series, Hull.  
July 28, Thursday—Boston, midsummer series, Hull.  
July 29, Friday—Quincy, Quincy.  
July 30, Saturday—Boston, midsummer series, Hull.  
August 2, Tuesday—Boston, Marblehead.  
August 8, Monday—Manchester, West Manchester.  
August 11, Thursday—East Gloucester, Gloucester.  
August 12, Friday—Annisquam, Annisquam.  
August 13, Saturday—Annisquam, Annisquam.  
August 25, Thursday—Plymouth, Plymouth.  
August 26, Friday—Duxbury, Duxbury.  
August 27, Saturday—Duxbury, Duxbury.  
August 29, Monday—Wellfleet, Wellfleet.  
August 30, Tuesday—Wellfleet, Wellfleet.  
September 1, Thursday—Cape Cod, Provincetown.  
September 2, Friday—Cape Cod, Provincetown.  
September 3, Saturday—Cape Cod, Provincetown.  
September 5, Monday—Lynn, Nahant.  
September 11, Sunday—Association rendezvous, Hull.

At the meeting Mr. Louis M. Clark resigned from the executive committee, on which committee he had served for ten years, or since the formation of the association. Mr. Clark's resignation is regretted on all sides, as he has ever been zealous in the affairs of the association and more than once has brought the organization out of perilous positions through his far-seeing judgment.

Mr. Clark was the organizer of the Yacht Racing Association of Massachusetts. It was he who called the first meeting, which was held at the rooms of the Massachusetts Y. C. on March 19, 1894, and which was known as the Congress of Regatta Committees. This meeting was adjourned for two weeks and, at the adjourned meeting, a schedule of non-conflicting dates was arranged. The practice of thus arranging racing fixtures has continued to the present time. Mr. Clark was elected the president of the organization, which was to be known as the Yacht Racing Association of Massachusetts, and he continued in that office until 1899. From the time the association was formed it has occupied a most prominent position in the yacht racing field and, through its influence, many features governing restricted classes have been made permanent in different sections of the country. The most active man in the establishment of permanent restricted classes and in the making of equitable rules for racing has been Mr. Louis M. Clark.

Interest in the racing of sailing dories along the north shore has become greater every year since the first famous Swampscott sailing dories were built in 1898 from designs of Mr. Charles D. Mower. In the Swampscott Dory Club and in the Annisquam Y. C. there has been quite a fleet of these little boats. Last season the Bay State Y. C., of Revere, a new organization, commenced to go in for dory sailing, and there are now a number of the boats in the club. On account of the interest in the class in the three clubs, it has been determined to organize an association for the development of the type, and this organization will be known as the Massachusetts Racing Dory Association. Ironclad rules for measurement and scantlings have been drawn up, so that the type as originally built, may be preserved without the introduction of freaky ideas. The officers of the Association are as follows: President, J. Samuel Hodge, Bay State Y. C.; Vice-President, Daniel H. Woodbury, Annisquam Y. C.; Secre-

tary-Treasurer, Harry O. Russ, Swampscott Dory Club. A schedule of races has been arranged as follows:

July 9, Saturday—Revere.  
July 16, Saturday—Swampscott.  
August 4, 5 and 6, Thursday, Friday and Saturday—Marblehead.  
August 13, Saturday—Annisquam.  
At the annual meeting of the Lake Winnepesaukee Y. C. the following officers were elected: Com., Frank P. Egan; Vice-Com., J. A. Dowling; Sec'y-Treas., J. Q. Litchfield; Meas., J. A. Dowling; Directors, Amasa J. Whitney, J. H. Pope, W. L. Smart, C. F. Pinkham, A. S. Johnson, O. A. Atkins, J. I. Stuart, A. J. Ward, Col. G. W. Moses, J. H. Whittier, Dr. F. E. Banfield, F. W. Rollins, C. L. Edgar, J. T. Meader and J. A. Dowling. At a joint meeting of the Lake Winnepesaukee Y. C. and the Kingswood Club, held at the Bellevue last Wednesday, the establishment of fixed lights on the lake, the betterment of channels and the issuing of sailing directions were discussed. At the meeting Mr. Roswell B. Lawrence, Secretary of the Appalachian Mountain Club, gave a lecture on the beauties of Lake Winnepesaukee.

Messrs. Burgess and Packard have received an order for a 23ft. one-design class for New Orleans yachtsmen. The first boat to be built will be for Mr. F. Clay Viguerie, of New Orleans Picayune. She will be 40ft. 6in. over all, 23ft. waterline, 11ft. 9in. beam, and 3ft. 3in. draft. She will have 1,145 sq. ft. of sail, and will carry 600 pounds outside ballast.

JOHN B. KILLEEN.

## One-Design Class of Catboats for Hempstead Bay Y. R. A.

THERE are building at the Milton Point Shipyard, Rye, N. Y., some twenty one-design catboats for members of the Hempstead Bay Y. R. A. The boats are 26ft. over all, 18ft. waterline, 7ft. 8in. breadth, and 1ft. 3in. draft. They will carry 340 sq. ft. of sail.

These boats are being constructed in the best possible manner, and great care is to be taken to make them strong and finish them up nicely. The waters in which these boats are to be used are as a rule very

Plans of One-Design Catboats for Hempstead Bay Y. R. A.

smooth even when there is a strong wind blowing; and they have been designed to give the greatest speed under such conditions. They will be very seaworthy and stand up well in a strong breeze. It is readily seen from the plan that there is very little resistance to this type of hull, and the boats ought to be fast. The racing of boats all of the same design and size has become very popular among many yacht clubs, and a great deal of interest is sure to be shown in this particular boat. More boats will be built from same design, and possibly by the end of the season there will be a fleet of thirty of these boats in waters about Freeport, L. I.

One of the boats is to have a portable summer cabin fitted, as the owner goes off on short cruises very often.

A NEW 15FT. ONE-DESIGN CLASS.—The Milton Point shipyard, Rye, N. Y., has closed a contract for six 15ft. waterline one-design boats for members of the Marine and Field Club. The boats are 24ft. over all, 15ft. waterline, 6ft. 6in. breadth and 3ft. 10in. draft. They will carry 1,000 lbs. of outside ballast. The boats were designed to meet the requirements governing the 15ft. of the Gravesend Bay Y. R. A. The construction is very substantial, and the boats should be fast and seaworthy.

\*\*\*

YAWL COON SOLD.—The auxiliary yawl Coon, purchased in New York last fall by Mr. Robert Galloway, of Memphis, Tenn., and used by him all winter on the Gulf of Mexico, has just been sold through the agency of L. D. Sampson to Mr. James Z. George, a member of the Southern Y. C., New Orleans, La.

\*\*\*

HOUSEBOAT ULMA SOLD. Mr. Robert W. Nelson has sold his power house boat Ulma through the agency of Messrs. Macconnell Brothers, to Mr. Henry Ashton Little, of Philadelphia.

### South Bay Y. C.

The South Bay Y. C. has its home on the most southerly arm of San Francisco Bay, at the head of navigation, in the little town of Alviso. Its membership for the most part is composed of business and professional men residing in the contiguous cities of San José and Santa Clara, eight miles distant, but connected by railroad.

The club was first brought into existence on March 4, 1897, and consisted of a dozen or more amateurs interested in boating, with three sloops and a schooner for their crafts. The first officers were headed by the veteran old salt, J. O. McKee, as Commodore, H. A. Spencer, Vice-Commodore, John E. Anzerais, Secretary, and S. E. Smith Treasurer. Before the first season was completed, Mr. Frank Davis joined the club and brought

Home of the South Bay Y. C.—Flagship Muriel in Foreground.

a fine launch, and thus from time to time the fleet and membership have been augmented, until at this date the former consists of two schooners, eight sloops and six launches, and the membership roll is about 100.

The year of 1903 was the most auspicious of all of the club's life, for this year saw them in possession and ownership of a commodious club house, located convenient to their moorings. There is in contemplation a series of high-class entertainments for the amusement of the members and their guests during the coming season, to take place at the club house.

The points for sailing, besides San Francisco, are Redwood City, San Mateo, Oakland, Sausalito, Vallejo, Napa, Benicia, Mare Island, Stockton and the towns and villages up the several rivers, and out the Golden Gate to Santa Cruz, Monterey, Bolinas and other points on the coast.

The officers for 1904 are Com., H. A. Spencer; Vice-Com., Louis Sonikson; Sec'y, N. E. Wretman; Treas., B. Swartz; Port Capt., S. E. Smith; Meas., J. O. McKee. The various committees will soon be selected, and it is fair to presume that this will be the banner year.

SAN JOSE, Cal., February.

### YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

**A. CASS CANFIELD DIES.**—A. Cass Canfield died at Aiken, S. C., after a short illness, on March 24. Mr. Canfield has been identified with yachting for many years past and was well known, not only as a very able amateur sailor, but as a designer as well. Mr. Canfield was fifty-one years old, and was born in Detroit. He was graduated from Princeton in 1874, and three years later received high degrees at Columbia. Most of his life was spent in travel and study. Soon after entering the ranks of yachtsmen he took up the study of naval architecture and became a proficient designer. Mr. Canfield's first yacht was Rosalie, a sloop. In 1884 he designed the cutter Isis, which boat had a successful racing career while under his flag. Later he bought the unsuccessful America's cup trial boat Priscilla. On her he made numerous changes which materially improved her. The famous schooner Sea Fox was designed by Mr. Canfield for his own use, and this fine vessel is to-day one of our best cruising schooners.

Mr. Canfield is No. 131 on the roster of members of the New York Y. C., having joined that organization in 1884. He served twice as a member of the committee on the defense of the America's cup. He was also on the committee on measurement of the New York Y. C., and gave great assistance to that board in framing the new rule during 1902-3.

In 1883 Mr. Canfield was elected a member of the Seawanhaka Corinthian Y. C. He was elected commodore in 1886, and held that office until 1890.

**ATLANTIC Y. C. SENDS FIRST ENTRY FOR N. Y. A. C. CUP.**—Mr. T. Alfred Vernon, Secretary of the Atlantic Y. C., has entered the sloop Adeline for Mr. J. B. O'Donohue for the race to be given by the New York Atlantic Club. The contest is scheduled for June 25, and the boats will race from Whortleberry Island to North Harbor, Block Island. Adeline is a centerboard boat, 41ft. overall, 25ft. waterline, 10ft. 6in. breadth and 2ft. 6in. draft.

**ARBECKA SOLD.**—Mr. J. B. Walker, editor Scientific American, has sold his knockabout, Arbecka, through the agency of Stanley M. Seaman, to Mr. Ernest A. Gerken, Jersey City, N. J.

**CRUISING LAUNCH FOR DR. CHARLES BRENTON.**—A

cabin cruising launch is being built at Mariner's Harbor, S. I., for Dr. Charles Brenton from designs made by Mr. Arthur Masters. The boat will be used next season on Narragansett Bay, and the following winter she will make a cruise to Florida. She is 56ft. 3in. over all, 54ft. 9in. waterline, 10ft. extreme breadth and 3ft. draft. A 20 horsepower Standard engine will give her a speed of about 12 miles.

**CORINTHIAN Y. C. OF SAN FRANCISCO.**—The yacht owners of the Corinthian Y. C., of San Francisco, met early in March to draw up a racing schedule for 1904. The following fixtures include several new events:

On May 1 the opening cruise in squadron; May 7, cruise to Petaluma drawbridge, returning the following day; May 21, cruise to Vallejo, returning the following day; May 30, annual regatta.

June 11 and 12, Point San Pablo and return; June 19, first outside cruise.

July 2, cruise to Army point; July 3, cruise to Vallejo through Montezuma slough, with handicap race back to clubhouse on the 4th; July 16, Paradise cove and return; July 24, non-yacht owners' day, handicap race in cruising rig.

August 6, second cruise to Petaluma draw bridge, yachts returning the following day. The annual cruise up river will take place from August 20 to 28.

September 3, cruise to Alviso, to visit members of South Bay Y. C.; September 17, cruise to Vallejo, returning the following day.

October 1, fleet will sail to Sausalito to join the fleet of the San Francisco Y. C. for the interclub "outside" cruise on the following day. October 22 the fleet will sail to Corinthian cove, and on the following day the annual games will take place. October 29 will be closing day, and the 30th the final cruise in squadron.

**SEA FOX CHARTERED.**—The schooner Sea Fox, owned by Mr. Anson Phelps Stokes, has been chartered to Mr. Percy R. Pyne through Messrs. Tams, Lemoine & Crane.

**CHALLENGE CUPS FOR RACEABOUTS.**—A challenge cup for raceabouts is to be offered by the members of the Indian Harbor Y. C. The conditions governing the races for the cup have not been decided upon but the details are now being arranged and will soon be made public.

## Rifle Range and Gallery.

### United States Revolver Association.

THE United States Revolver Association is a national organization formed for the purpose of encouraging, regulating and conducting pistol and revolver shooting under uniform conditions throughout the United States.

The national indoor championship contests for the pistol and revolver have just closed, being held simultaneously in the principal cities throughout the country under regulations that insured uniform conditions. The leading scores follow:

Revolver.						Total.
S	E	S	E	S	E	
S E Sears, St. Louis	95	95	96	96	96	478
Dr W H Luckett, New York	86	93	93	89	86	447
Lieut. R H Sayre, New York	81	83	86	83	92	425
E L Harpham, Chicago	86	80	83	84	85	418
A L A Himmelwright, New York	82	81	86	77	79	405
W E Proll, San Francisco	82	77	84	72	79	394
Henry Klotz, New York	86	80	67	76	83	392
W G Krieg, Chicago	87	65	71	83	86	392
Capt W B Martin, New York	79	77	68	81	78	383

The above scores were made on the Standard American target at a distance of 20yds.

The performance of Mr. Sears is remarkable. The best previous 50-shot revolver record at 20yds., was 464, made by Dr. Luckett, of New York city.

Dr. E. H. Kessler, of St. Louis, the winner of the indoor pistol championship, is one of the prominent officials of the St. Louis Sharpshooters' Association, and was recently chosen by the Louisiana Purchase Exposition to take charge of the rifle and revolver tournament to be held there.

The matches were held in Boston, New York, Springfield, Chicago, St. Louis and San Francisco.

The conditions were as follows:

**Indoor Revolver Championship.**—Open to everybody; distance 20yds.; 50 shots on the Standard American target, reduced so that the 8-ring is 2.72in. in diameter. Arm, any revolver. Ammunition, any suitable smokeless gallery charge approved by the executive committee. The score must be completed in one hour or less from the time of firing the first shot. Entrance fee, \$5; no re-entries.

**Prizes.**—First, a silver cup, to be held until the next annual competition, the cup to become the property of the competitor winning it three times; second, a silver medal; third, a bronze medal. A bronze medal will also be awarded to any competitor, not a prize winner, making a score of 425 or better.

In 1901 first prize was won by W. E. Petty on a score of 439; second, J. A. Dietz, Jr., 439; third, R. H. Sayre, 433.

In 1902, first prize was won by W. E. Petty, on a score of 439; second, R. H. Sayre, 436; third, A. L. A. Himmelwright, 428.

In 1903, first prize was won by Wm. H. Luckett, on a score of 437; second, J. A. Dietz, Jr., 434; third, W. A. Smith, 427.

**Indoor Pistol Championship.**—Open to everybody; distance, 20yds.; 50 shots on the Standard American target, reduced so the 8-ring is 2.72in. in diameter. Arm, any pistol. Ammunition, any suitable smokeless gallery charge approved by the executive committee. Black powder ammunition allowed in .22cal. pistols. The score must be completed in one hour or less from the time of firing the first shot. Entrance fee, \$5; no re-entries.

**Prizes.**—First, a silver cup, to be held until the next annual competition, the cup to become the property of the competitor winning it three times; second, a silver medal; third, a bronze medal. A bronze medal will also be awarded to any competitor, not a prize winner, making a score of 435 or better.

In 1901, first prize was won by R. H. Sayre, with a score of 433; second, J. A. Dietz, Jr., 429; third, J. B. Crabtree, 427.

In 1902, first prize was won by R. H. Sayre, on a score of 448;

second, J. A. Dietz, Jr., 428; third, A. L. A. Himmelwright, 408.

In 1903, first prize was won by T. Anderton, on a score of 460; second prize, J. A. Dietz, Jr., 456; third, R. H. Sayre, 446.

### The New York Corps.

THIS corps closed its winter gallery contest on March 25.

Ten-shot scores, 25-ring target, distance 75ft.: R. Gute 245, 244; J. Facklamm 241, 231; J. H. Hainhorst 230, 230; A. W. Lemcke 225, 232; B. Zettler 237, 228; J. N. F. Siebs 237, 239; C. Schmitz 225, 231; O. Schwanemann 237, 237; H. Lohden 226, 234; H. Haase 227, 231; F. Facompre 226, 232; J. C. Bonn 229, 227; H. Beckmann 224, 226; H. B. Michaelsen 229, 230; G. Offermann 233, 231; J. G. Tholke 230, 220; G. Thomas 225, 231; H. Gobber 225, 221; H. D. Meyer 228, 217; D. Pepper 223, 220; M. J. Then 225, 213; C. König 226, 216; H. Leopold 218, 228; C. Wahmann 214, 223; H. Koster 210, 221; P. Heidelberger 219, 226; W. Dahl 225, 217; N. C. L. Beversten 226, 216; F. Dierks 229, 211; J. H. Doscher 219, 215; H. Decker 209, 219; A. Evers 215, 219; H. C. Hainhorst 215, 215; L. C. Hagenah 212, 216; J. Jantzen 223, 202; J. C. Kruse 212, 210; H. Koster 217, 210; J. G. Voss 218, 210; H. Winter 214, 207; W. Schultz 217, 213; C. Roffmann 218, 217; H. Rottger 212, 215; H. Quinten 220, 215; R. Ohms 218, 212; H. Nordbruch 213, 219; J. H. Meyer 226, 207; H. Meyn 211, 212; H. Offermann, 209, 214; J. Paradies 205, 212; J. C. Brinkmann, 209, 217; C. Brinkama, 209, 217; H. R. Coplan 204, 209; J. C. Degenhardt 216, 197; D. H. Brinkmann 205, 201; M. von Dwingelo 210, 202; H. Heinecke 207, 203; H. Horenberger 212, 207; H. Haaren 177, 217; G. Junge 204, 218; H. König 203, 196; B. Kumm 133, 196; F. Schultz 199, 174; W. Schaefer 209, 197; C. Mann 188, 207; D. von der Lieth 205, 200; E. F. Lankenau 214, 201; J. May 197, 185; A. Lederhaus 185, 162; N. Jantzen 179, 163; N. W. Haaren 183, 193; G. Hagenah 193, 150; L. L. Goldstein 173, 196; Aug. Beckmann 191, 198; J. Gobber 153, 131.

Bullseye target, 4in. carton, the best center shot to count by measurement: F. Schultz 26½ degrees, R. Gute 32½, W. Dahl 34½, J. C. Bonn 36, J. W. Siebs 37½, H. Meyn 40, W. Schultz 41½, G. Offermann 44, F. Facompre 43, P. Hiedelberger 48½, H. D. Meyer 59½, A. W. Lemcke 63, J. H. Hainhorst 66, G. Voss 70½, A. Evers 71, C. Schmitz 75, H. Beckmann 79½, D. Pepper 80, J. Facklamm 81½, J. C. Degenhardt 83½, H. Offermann 95, H. Heinecke 98, H. Quinten 100½, J. C. Kruse 102, D. H. Brinkmann 117, H. Decker 131.

### New York Central Corps.

At the last shoot of the New York Central Corps on March 23, 10-shot scores, two to count, 25-ring target, distance 75ft., the scores made were as follows: R. Gute 244, 239, J. N. F. Siebs 242, 236; B. Eusner 242, 232; H. D. Muller 236, 235; D. Scharninghaus 244, 225; Ch. Gerken 234, 232; Geo. A. Viemeister 227, 239; F. Kast 236, 229; H. Rolfe 229, 233; F. Schraeder 233, 226; F. W. Wessel 227, 232; J. von der Lieth 228, 222; J. Feldscher 232, 223; H. Schroder 225, 220; W. Schillingmann 217, 224; F. Brodt 221, 221; F. Schiller 228, 214; A. Rohde 217, 213; M. Jaeger 210, 213; A. D. Ritterhoff 217, 225; J. Roffmann 208, 203; F. Engelken 217, 210; Ch. Tietjen 203, 212; H. A. Fecke 208, 205; G. Dettloff 213, 198; J. H. Speckmann, Jr., 212, 198; H. von der Lieth 214, 194.

Bullseye target, 4in. carton, the best center shot to count by measurement: R. Gute 44 degrees; H. von der Lieth 46, G. A. Viemeister 48, H. Rolfe 55, Fritz Brodt 77.

### Zettler Rifle Club.

At the weekly gallery shoot of the Zettler Rifle Club, March 22, scores were as follows:

Ten-shot scores, 25-ring target, distance, 75ft.; 100 shots: Louis C. Buss 2451, Wm. A. Tewes 2448, L. P. Hansen 2438, Geo. Schlicht 2424, H. Fenwirth 2369, Maj. A. Rowland 2294.

Fifty shots: R. Gute 1220, E. Van Zandt 1206, A. Kronsberg 1205, Louis Maurer 1204, Chas. Zettler, Jr., 1201, Chas. Zettler, Sr., 1191, B. Zettler 1186, Aug. Begerow 1183, Geo. Bernius 1133, W. A. Hicks 1196.

### Miller Rifle and Pistol Club.

At the weekly gallery shoot of the Miller Club, March 23, 10 shots, distance 75ft., the following scores were made: F. Unbehau 246, D. Miller 242, C. Bischoff 242, D. Dingmann 241, E. Doyle 240, R. W. Evans 235, R. A. Blake 231, L. Rodges, 226, C. Bayha 225, R. W. Dahlman 218.

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

### Fixtures.

April 1.—Shingle House, Pa.—Owego Valley Rod and Gun Club seventh tournament. U. S. Dodge, Sec'y, Millport, Pa.  
April 1-2.—Newark, N. J.—Forester Gun Club tournament.  
April 2.—East Millstone, N. J., Gun Club merchandise and sweepstake shoot.  
April 6.—Sheepshead Bay, L. I.—Eastern amateur target championship, on grounds of Sheepshead Bay, L. I., Gun Club.  
April 6.—Parkersburg, W. Va.—Ohio Valley Shooting Association Spring tournament.  
April 6-7.—Bristol, Tenn.—The Interstate Association's tournament, under the auspices of the Bristol Gun Club. S. W. Rhea, Sec'y.  
April 7.—Bethlehem, Pa.—Lehigh Rod and Gun Club of the Bethlehem all-day target tournament. H. F. Koch, Sec'y.  
April 12-13.—Indianapolis, Ind.—Indiana League of Trapshooters' annual tournament.  
April 16.—Bound Brook, N. J., Gun Club all day target shoot; free silver prizes. Dr. J. B. Pardoe, Sec'y.  
April 18-22.—Kansas City, Mo.—J. F. Schmelzer & Son's Arms Co. fourth Interstate midwinter shooting tournament; targets and live birds.  
April 19.—Springfield, Mass.—Shooting Club Patriots' Day tournament. C. L. Kites, Sec'y.  
April 19.—Wellington, Mass.—All-day shoot of the Boston Shooting Association. O. R. Dickey, Mgr.  
April 19.—Haverhill, Mass., Gun Club's eighth annual Patriots' Day tournament. S. G. Miller, Sec'y.  
April 19-21.—Paducah, Ky., Gun Club's spring tournament. W. B. Kennedy, Sec'y.  
April 20-21.—Rensselaer, Ind., Gun Club amateur tournament. Everette Brown, Mgr., Pleasant Grove, Ind.  
April 21.—Easton, Pa.—The Independent Gun, Rifle and Pistol Club's first annual target tournament. Edw. F. Markley, Sec'y.  
April 23.—Trenton, N. J., Shooting Association's big merchandise shoot. J. R. Taylor, General Manager.  
April 23.—Philadelphia.—Team shoot: Trenton University vs. University of Pennsylvania.  
April 26.—Greenville, O., Gun Club amateur tournament. H. A. McCaughey, Sec'y.  
\*April 26-27.—Pittsburg, Pa.—Herron Hill Gun Club tournament. \$100 added. Louis Lautenslager, Mgr.  
April 26-29.—Kansas City.—Spring target tournament at Blue River Park. R. S. Elliott, Mgr.

April 27-28.—Americus, Ga.—The Interstate Association's tournament, under the auspices of the Americus Gun Club. H. S. McClesky, Sec'y.

April 28.—Brunswick, Me., Gun Club's Fast Day shoot. G. M. Wheeler, Sec'y.

April 30.—Princeton, N. J.—Team shoot: Princeton University vs. Crescent Athletic Club, of New York.

May 3-4.—Wabash, Ind., Gun Club tournament.

\*May 3-4.—Derry, Pa., Rod and Gun Club.

May 3-5.—Junction City, Kans.—Kansas State Sportsmen's Association annual tournament. E. L. Weitzig, Sec'y.

May 4-5.—Rochester, N. Y., Rod and Gun Club spring tournament.

May 4-5.—Nashville, Tenn.—The Interstate Association's tournament, under the auspices of the Cumberland Park Driving Club. Charles Eastman, Sec'y.

May 7.—New Haven, Conn.—Intercollegiate shoot.

May 11-12.—Springfield, O., Gun Club's target tournament. Geo. Morgan, Sec'y.

May 11-13.—Spirit Lake, Ia.—Iowa State Sportsmen's Association tournament. J. Burmister, Sec'y.

May 12-13.—Wilmington, Del.—Wawaset Gun Club annual spring tournament. W. W. Foord, Sec'y.

May 16-18.—Southern Trapshooters' Association's thirteenth tournament at targets, under auspices of Vicksburg, Miss., Gun Club; \$500 added. J. J. Bradford, Sec'y.

May 16-21.—York, Pa.—Tournament of Pennsylvania State Sportsmen's Association, under auspices of York City Gun Club. N. M. McSherry, Sec'y.

May 17-18.—Dubuque, Ia., Gun Club's fifth annual amateur target tournament. A. F. Heeb, Cor. Sec'y.

May 17-18.—Dallas, Tex.—The Interstate Association's tournament, under the auspices of the Dallas Gun Club. E. A. Mosely, Sec'y.

May 17-19.—Davenport, Ia.—Cumberland Gun Club's annual amateur tournament. W. F. Kroy, Sec'y.

May 18.—Boston, Mass., Gun Club annual team target shoot. H. Kirkwood, Sec'y, 23 Elm street, Boston.

May 18-20.—Columbus, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament. G. A. Schroeder, Sec'y.

May 19-20.—Oklahoma City.—Territorial Sportsmen's Association fifth annual tournament; \$300 added money. J. C. Clark, Sec'y.

May 20.—Charlotte, N. C., Gun Club tournament.

May 21.—Princeton, N. J.—Princeton University vs. University of Pennsylvania.

May 23-25.—Houston, Tex.—Texas State Sportsmen's Association tournament.

May 24-25.—Marshalltown, Ia., Gun Club two-day target tournament.

May 24-25.—Mt. Sterling, Ky.—Kentucky Trapshooters' League tournament. Frank Prago, Sec'y, Louisville, Ky.

\*May 25-26.—Brownsville, Pa., Rod and Gun Club.

May 25-26.—Shamokin, Pa., Gun Club Spring shoot. S. C. Yocum, Sec'y.

May 28-30.—Butte, Mont.—Montana State Sportsmen's Association eleventh annual tournament at targets; \$500 added. C. H. Smith, Sec'y.

May 30.—Newport, R. I.—Aquidneck Gun Club's third annual tournament. J. S. Coggeshall, Secretary, Box 9, Newport, R. I.

May 30.—Albany, N. Y.—West End Gun Club tournament. H. H. Valentine, Sec'y.

May 30.—McKeesport, Pa.—Spring tournament of the Enterprise Gun Club. Geo. W. Mains, Sec'y.

May 30.—Ossining, N. Y., Gun Club Decoration Day target shoot. C. G. Blandford, Capt.

May 31.—Dayton, O.—Rohrer Island Gun Club spring target tournament. W. E. Kette, Sec'y.

June 1-3.—Watertown, S. D.—South Dakota State Sportsmen's Association tournament. F. J. Cory, Sec'y.

\*June 7-8.—Ligonier, Pa., Rod and Gun Club.

June 7-9.—Sioux City, Ia.—Soo Gun Club's tenth annual amateur tournament; added money. W. F. Duncan, Sec'y.

June 8-10.—Huntington, W. Va.—West Virginia State Shoot. F. H. Merrick, Sec'y.

\*Aug. 25-26.—Tarentum, Pa., Rod and Gun Club.

\*Western Pennsylvania Trapshooters' League tournaments. C. G. Grubb, Sec'y, Pittsburg.

## DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

Mr. Frank E. Butler informs us that Annie Oakley (Mrs. F. E. Butler) has made a satisfactory settlement with certain Massachusetts newspapers for a libelous publication of some months ago, after one judicial decision was made in her favor.

From May 28 to 30, inclusive, are the dates fixed upon for the eleventh annual tournament of the Montana State Sportsmen's Association, to be held at Butte. The competition will be at targets, and \$500 will be added. The secretary is Mr. C. H. Smith, Butte.

The Princeton University trapshooting team will be in active competition in April and May. It will engage in team contests as follows: April 23, University of Pennsylvania, at Philadelphia; April 30, Crescent Athletic Club, of New York, at Princeton; May 21, University of Pennsylvania, at Princeton, and on May 7, the Intercollegiate contest is fixed to take place at New Haven. Mr. J. H. Sluterman, '05, was recently elected captain of the Princeton team, vice Mr. Pierce Archer, '04, resigned.

On some Saturday afternoon in April, the third team match will decide the supremacy of either the Ossining Gun Club or the Schenectady Gun Club, each having a win to its credit. The contest will take place on the grounds of the Poughkeepsie Gun Club.

The beautiful trophy, emblematic of the eastern amateur individual target championship, to be shot for under the auspices of the Sheephead, L. I., Gun Club on April 6, is on exhibition in the window of Messrs. Schoverling, Daly & Gales, 302-304 Broadway, New York.

The Aquidneck Gun Club, of Newport, R. I., has installed its traps, etc., on new grounds. The club has fixed upon May 30, Memorial Day, as the date for its third annual tournament. Programmes will be ready on May 1. The secretary is Mr. J. S. Coggeshall, Box 9, Newport, R. I.

The Highland Gun Club and the North Camden Gun Club, at Gorgas Station, Pennsylvania, March 26, held a fifteen-man team contest, 25 targets per man, the Highland team pressing the Camden team closely by the narrow margin of 33 targets. Scores: Camden 269 to 236 out of a possible 375 targets.

The Trenton, N. J., Shooting Association announces a big merchandise shoot, to be held on April 23, on the Interstate Fair grounds. Entrance fee, cost of targets. Three sets of traps. One handsome prize for best professional average. Send luggage to E. S. Applegate & Co. Mr. J. R. Taylor is general manager.

Lieut. H. Sauer, of the firm of J. P. Sauer & Son, after a visit of several months in the United States, chiefly in New York, returned to his home, Suhl, Germany, Tuesday of this week, on the S.S. Kaiser Wilhelm der Grosse. He was so pleased with America that he contemplates another visit next year to the United States.

The programme of the New Haven Gun Club's twenty-ninth annual tournament, fixed to be held on Friday of this week, provides fifteen target events, 10, 15 and 20 targets, totals of 190 targets and \$15.33 entrance. Shooting commences at 9 o'clock. Targets 1½ cents. All shooters are invited. Mr. John E. Bassett is the secretary.

In a twenty-one-man team contest at Narberth, Pa., between teams of the Narberth Gun Club and the Meadow Springs Gun Club, 25 targets per man, the scores were 264 to 203 out of 525, in favor of the Narberth team. High man, Roberts, broke 19, and low man scored 5, so that the extreme possibilities of the contest were not strained to the utmost.

Mr. Edward Banks, now of Wilmington, Del., was a visitor in New York in the early part of this week. He was enthusiastic in his description of his new domicile. As we remember it, he could shoot magnificent, toothsome shad from his back door, and seine targets within a convenient distance landward. Still, he had some pleasant words for this restful town, New York.

Mr. T. H. Keller, of the Peters Cartridge Company, is due in New York from his recreative ocean voyage some day this week. The season of March gales peculiarly appealed to him for an enjoyable, benignant journey afloat, which, to the landsman who views things differently, would seem about equivalent to repose on a bucking bronco. May his shadow never grow less.

The Legislature of New Jersey adjourned recently without passing the anti-trapshooting pigeon bill, the purpose of which was to entirely prohibit the shooting of birds from the traps. This may be construed as a rebuke to the professional humanitarians and the sensational journals which seriously impeded legislation in New Jersey on important business matters by keeping before the Legislature an anti-shooting bill which relatively was insignificant in importance.

The Hudson Gun Club, of Jersey City, N. J., announces two shoots for April, the first one to be held on April 3. For the main event of the second shoot; on April 17 a prize contest at 100 targets is on the programme. A hand-painted stein, donated by one of the club members, will be the reward of the winner. A distance handicap will govern. No entrance fee, and everybody is eligible. Targets, 1½ cents. Mr. Jas. Hughes, 831 Pavia avenue, is the secretary.

The seventh contest of the live-bird series at the Point Breeze race track, Philadelphia, on Saturday of last week had fifteen contestants, and of these, Mr. A. A. Felix was alone on an individual pinnacle of excellence, having killed all the 10 birds straight in the presence of the other fourteen who had not. He further accentuated his superiority by defeating Murphy in a 10-bird match by killing them all, and yet the race was close, his opponent being only 2 behind.

New Orleans, La., recently manifested some disapproval of live pigeon shooting at the traps, through the action of the Board of Directors of the Louisiana State Society for the Prevention of Cruelty to Animals. The Board considered such shooting unnecessary and a violation of the State laws, and it adopted a resolution to instruct its counsel to take measures to prevent pigeon shooting. This action was in the main evoked by a match at 100 pigeons at New Orleans, between the famous sportsmen Messrs. Norvin T. Harris and R. E. Saucier, for \$100 a side on March 5. The scores were: Saucier 81, Harris 72. The agent of the Louisiana State Society for the Prevention of Cruelty to Animals interposed to prevent it, but he failed in his purpose. This, of course, only incited the society to greater effort.

Barring the little tiff between Russia and Japan, concerning which the Associated Press Board of Strategy destroys one navy or the other each day and restores it intact the next day for future consumption, shooting has been very dull during 1904 up to the present time, considered from a general viewpoint. It is notable also, as it concerns shooting at the traps, that no one this year yet has discovered and published a system governing

the division of the moneys whereby in a contest each participant divides first money, wins it alone, or at the worst saves his entrance fee unimpaired. In the past, the general activity in practically testing how an infallible system worked to make a winner out of a loser, made activity in sweepstake matters till it was gravely determined that, nevertheless, some shot better than others and won, or else there was the paradox that where all were winners all were losers.

The programme of Messrs. R. S. Elliott & Co.'s first annual target interstate shooting tournament, to be held at Kansas City, Mo., April 26-29, is now ready for distribution. First two days are at targets; the other days at pigeons. April 25 is practice day. The target programme is alike each day—ten events, 20 targets, \$2 entrance, \$10 added. To professionals and amateurs respectively, \$25 for high average, two moneys. April 28, Interstate amateur five-man team shoot, 20 birds, entrance \$25; optional sweep, \$10. Rose system, 7, 5, 3, 2; \$100 cup to the winning team; cup subject to challenge for one year, redeemable by R. S. Elliott & Co. at their next annual tournament in 1905 at \$100. April 29, individual amateur interstate challenge cup, 25 birds, \$20 entrance, Rose system, 7, 5, 3, 2. Professionals may shoot for money only; any one may shoot for the cup, entrance, price of birds, \$6.25. Cup redeemable under same conditions as team cup. Also merchandise prizes, competition open to amateurs only, will be the subject of target competition.

BERNARD WATERS.

### Aquidneck Gun Club.

NEWPORT, R. I.—The club members celebrated their farewell to the old grounds on Wednesday with the regular semi-monthly badge contest. Nine faced the traps, and the resultant scores were fairly good as a whole, Manchester annexing another win with 43.

The day was a delightful one for March; every one felt it good to be out of doors.

The matter of new grounds has been in the hands of a committee for some weeks. A selection of a lot has been made, and the club house and traps are now bound thither. The new location is on Bliss Mine road, a trifle longer walk from the trolley, but still no further from town. The old five-trap system will be retained, it being found impossible to use two sets of traps, as it was hoped to do. Now that the matter of new grounds is settled, arrangements can and will be made for the third annual on May 30.

Targets:	10	10	10	10	10	Total.
Manchester .....	10	8	9	8	8	43
Hughes .....	6	8	8	9	9	40
Alexander .....	8	7	8	9	7	39
Peckham .....	7	8	8	9	7	39
Bowler .....	7	7	6	7	7	34
Powel .....	8	6	5	6	8	33
Dring .....	8	7	4	6	8	33
Macomber .....	3	3	4	6	7	23
Griffin .....	5	6	..	..	..	11

The third annual tournament of the Aquidneck Gun Club will be held on Memorial Day, May 30, when it is hoped the success of former tournaments will be repeated. Programmes will be ready about May 1, and may be had on application to J. S. Coggeshall, Secretary, Box 19, Newport, R. I.

### Tippecanoe City.

The Tipp City Fish and Game Protective Association was organized on March 15, at Tippecanoe City, O., with the following officers: John Rohrer, President; H. J. Harshberger, Vice-President; Frank D. Nunlist, Secretary and Treasurer; Directors, Geo. Fry, W. F. Bennett. The club started with thirty-three charter members, and proposes to look after game interests in their locality. They are deeply interested, want the laws enforced, and will do all possible to that end. They will also work for the restocking of the streams with fish.

The Tipp Gun Club, of Tippecanoe City, met with a severe loss in the death of the secretary, Mr. H. E. Brier, and has done no shooting for over two months. Probably when the weather becomes settled the sport will be taken up again.

BONASA.

### Trap at Pinehurst.

PINEHURST, N. C.—The weekly contest at the traps at Pinehurst had a 60-target contest for the main event. The targets were divided into 30 singles and 15 pairs.

Mr. M. H. Wilson, of Cleveland, with a handicap of 8 targets, won with a net score of 41. Mr. A. E. Lard, of Washington, D. C., scratch, was 38.

Other scores, handicaps added, were: C. A. Lockwood, New York, 24; Arthur C. Ketcham, New York, 23; Edward C. Hoyt, New York, 22; J. D. Wescott, Union City, Pa., and J. Howard Edwards, Brookline, Mass., 19.

Two 10-target events followed, Mr. Lockwood winning the first with 8, and Mr. Wilson the second with 9.

### Dubuque Gun Club.

DUBUQUE, Ia., March 26.—The Dubuque Gun Club held its seventh weekly trophy shoot on Friday, March 25. A strong north wind made the flight of targets very erratic and assisted materially in reducing scores. Each man shot at 50 targets. Scores:

Class A: J. O'Brien 45, A. J. Schmid 40.  
Class B: A. Y. McDonald 36.  
Class C: Ed. Ryan 39, H. Michel 38, Dr. B. Michel 36, J. Murphy 36, J. McDonald 28, J. B. Iles 26, H. Knoernschild 25.  
F. M. JAEGER, Sec'y.

### For New Hampshire Shooters.

WINCHESTER, N. H., March 28.—The championship trophy, the handsome cup given by the Peters Cartridge Company to the State of New Hampshire, is on exhibition this week in Mr. O. H. Sleeper's window, Exeter, N. H.

The present holder of this trophy is Mr. L. R. Nelson, Winchester, N. H. The trophy is subject to challenge at any time by any man in the State.

It is a very handsome cup, one that all lovers of trapshooting should see and take an interest in.

L. R. NELSON.

### Cleveland Gun Club.

The prize package shoot of the club held on March 19 at 40 targets, was attended by a big crowd, and was an interesting affair. The scores: Jack 36, Hall 36, Eadie 32, J. F. 31, Cannon 30, Hopkins 28, North 26, Fitz 26, Mack 26, Battles 26, Klint 24, Bigelow 22, Hull 22, Freeman 17, Purcell 12.

Shoot-off of ties on 26, 20 targets: North 15, Mack 12, Battles 9, Fitz 8.

## IN NEW JERSEY.

## Hell Gate Gun Club.

Carlstadt, N. J., March 22.—The weather was extremely unpropitious, raw, rainy, cloudy and dismal generally. Considering the bad weather conditions, the birds were a good lot. The March shoot of the Hell Gate Gun Club was held at Outwater's, and the scores made were as follows, in the club event at 10 birds:

G Van Valkenberg.....	28	2222222022—9
J A Belden.....	28	6 011*220211—7

## Hudson Gun Club.

Jersey City, N. J., March 20.—On this date a successful shoot was held by the Hudson Gun Club, of Jersey City. The day was fine, and everybody seemed to have a good time.

This club holds two shoots in April—3 and 17. On the last date there will be a 100-target event. The prize will be a hand-painted stein, donated by one of the members. In this event, distance handicaps will be used. There will be no entrance fee, and the price of targets will be 1½ cents. Everybody is eligible. Don't forget the date.

Targets:	25	25	25	10	25	25	15

## Montclair Gun Club.

Montclair, N. J., March 26.—The cup shoot this afternoon was very well attended, over twenty taking part.

Although the sky was overcast, and the wind at times quite blustery, the weather conditions were generally favorable, and all present had a good time.

Arrangements had been made with a Newark photographer to take a large picture of the club, which was done when the shoot was about half over.

Interest has been increasing of late. The club has added to its membership quite largely, and is in a very prosperous condition.

Messrs. Schneider, Cross and Case, Jr., were the guests of the club.

EDWARD WINSLOW, Sec'y.

## Franklin Gun Club.

Franklin Furnace, N. J., March 26.—At the shoot to-day of the Franklin Gun Club the scores were as follows: John Williams

broke 20 out of 32; Ander Wright, 26 out of 34; Frank Kishpaugh, 40 out of 55; Alf. Wright, 25 out of 37; Milt Morgan, 22 out of 40; Frank Morgan, 7 out of 14; Fred Southard, 4 out of 24; Frank Ramage, 7 out of 25.

## ON LONG ISLAND.

## Sheepshead Bay Gun Club.

Sheepshead Bay, L. I., March 24.—The shoot to-day was a special and the attendance was notable as to the aggregate of ripe ages, a majority of the contestants having passed the half-century mark. Mr. J. Tappan was badly handicapped by imperfect eyesight. The scores:

Team match, 25 targets:			
Pillion .....	10	Cruson .....	10
McKane .....	20	Montanus, Jr.....	18
Suss .....	7	Dr Goubeaud .....	10
Montanus, Sr.....	8	Bush .....	9
Fransoli .....	8—52	Tappan .....	5—52

Second team match, 25 targets:			
McKane .....	19	Montanus, Jr.....	19
Pillion .....	12	Suss .....	8
Fransoli .....	7	Montanus, Sr.....	12
Dr Goubeaud .....	12	Cruson .....	9
Tappan .....	0-50	Bush .....	9-57

Two 10-target events resulted as follows: Pillion 5, Suss 3, Cruson 4, Goubeaud 4, Fransoli 4, Montanus, Sr., 1, Montanus, Jr., 8, Bush 6.

Second event: Pillion 5, Cruson 5, Montanus, Sr., 2, Montanus, Jr., 6, Bush 5, Tappan 1, McKane 8.

## Crescent Athletic Club.

Bay Ridge, L. I., March 26.—A light attendance marked the close of the shooting season of the Crescent Athletic Club. Mr. F. B. Stephenson's three scores of 22, 24, and 21 proved to be the winning performances in the March cup contest. Scores:

Trophy shoot, 15 targets: C. Kenyon, Jr., (3) 15, H. C. Werleman (4) 12, Capt. Money (0) 12, O. C. Grinnell, Jr., (4) 10, Dr. Pool (2) 10, H. B. Vanderveer (1) 9, W. W. Marshall (3) 9, L. C. Hopkins (1) 8, Geo. W. Meeker (2) 7.

March cup, 25 targets: Brigham (0) 21, Werleman (7) 21, F. B. Stephenson (1) 20, G. B. Stephenson, Jr., (2) 20.

Sauer gun, 25 targets: F. B. Stephenson (1) 24, A. G. Southworth (1) 22, Brigham (0) 22, Money (1) 20.

Shoot-off, 25 targets: F. B. Stephenson (1) 23, H. C. Werleman (7) 21.

## Springfield Shooting Club.

The Springfield, Mass., Shooting Club will hold one of their popular all-day tournaments at clay targets on Patriots' Day, April 17. Shooting will begin at 9:30 A. M. The programme calls for three 10, five 15, one 20, and two 25-target events; 175 targets in all; \$17 entrance in the sweeps; \$5 in gold to the amateur making high average shooting the entire programme. Purses will be divided by the Rose system, four moneys; less than ten entries, three moneys. In addition to the regular programme, the club will run a national sportsman contest. This will be a 25-target event; open to all amateurs; \$1 entrance, targets extra. Value of prizes depends on number of entries received. Handicaps will be arranged in this event from 16 to 25yds. mark.

Springfield Shooting Club's House and Grounds.

Professionals and paid experts allowed to shoot for targets only in order to advertise their goods. Sweepstakes being optional, any one may enter any event for price of targets only. Targets included in all events at 2 cents each. To reach the club grounds take Indian Orchard or Palmer cars to Red House Crossing; grounds one minute walk from car line. Guns and ammunition shipped to the secretary, C. L. Kites, 499 Main street, will be delivered on grounds free of charge. Lunch will be served at club house. Loaded shells will also be for sale. Programmes are now ready, and may be procured by addressing the secretary.

During the season the club members will shoot for a gold badge.

## Ossining Gun Club.

OSSINING, N. Y., March 26.—The next regular practice shoot of the Ossining Gun Club will be held on April 2, at 2 P. M. The members are requested to make a special effort to be present, as there will be three prizes to compete for.

The captain of the Schenectady Gun Club, Mr. Valentine Wallburg, has sent a challenge to the Ossining Gun Club to shoot a long deferred match between these two clubs, to be shot on neutral grounds. Poughkeepsie is to be the battleground, and as each one of these clubs has a match to its credit, this final match will be of particular interest. At the last team shoot, which was held at Schenectady, the winning team won by 3 targets, with a general percentage of 879, ten men up.

Members of the Ossining team and aspirants for same, will try to be present for practice on April 2, as this team shoot is to be held some Saturday afternoon during the month of April.

C. G. B., Captain.

## Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., March 24.—The sun shone brightly and the air was warm to-day. The conditions were just right for trapshooting.

The trap was speeded up and the targets thrown 70yds., giving excellent practice. Some of the boys could hardly adapt themselves to the changes of speed, and scores suffered.

Capt. Traver, as usual, shot in good form; and Du Bois also gave a good account of himself. Hans was unused to the gun he was shooting, but toward the last began to "get on." Du Bois captured the cup with a full score, with Traver and Winans but one point to the bad. Marshall did some good work, but was a little unsteady at times. Buckley has just recovered from a serious illness; therefore was in no condition to shoot well. D'Arcy is a new one, willing to learn. Smith can do better, and will, next time. Scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	11
Targets:	10	10	10	10	10	10	10	10	10	25	25

Traver.....	21	3	24	..	..	..	..	..	..	..	..
J Rhodes.....	19	4	23	..	..	..	..	..	..	..	..
Claymark.....	14	6	20	..	..	..	..	..	..	..	..
Marshall.....	13	4	17	..	..	..	..	..	..	..	..

David N. Tallmann, of Willmar, Minn., was the guest of his brother, Isaac Tallman, the well-known amateur trapshooter, of Millbrook, N. Y., last week. For a little amusement the two brothers shot three 100-target matches, the last two of which were shot the same afternoon. Scores made were as follows:

*D N Tallman.....	95	90	67	275	252
I Tallman ...:	94	99	98	300	291

# Good Tackle Means Success.

**E**VEN the generous size of the page in FOREST AND STREAM does not give sufficient space to carry out the argument of good tackle as an essential to success; nor does it occur to us that a cold type argument is necessary to the angler who knows his business. Without good tackle we all know success to be next to impossible. The joys of fishing are best known where break-downs do not occur. Pursuant to this thought, we are mentioning in this advertisement different articles for the fisherman that we know will contribute to the success of all his outings in search of fish. Even this space does not enable us to mention very many articles in our tackle department, but what we do not mention here you will find in our big new catalogue. If you will send for it, you will find every need supplied there.

GOOD TACKLE MEANS SUCCESS.

**RODS.** We call special attention to our new hand-made bait casting rod, the "Hercules Hexagonal Split Bamboo,"  $5\frac{1}{2}$  to 6 ft. long, weighing 6 to 7 oz. These rods, with one of the New "Gayle" Kentucky casting reels with drag and click, will weigh together about 10 oz. and make an outfit impossible to beat. These will be our leaders this season and are made in two qualities, \$15.00 and \$25.00 net each.

The "Gayle" Kentucky reel specially adapted to these rods costs \$15.00 net each.

Our Assortment of **hand-made** Split Bamboo, Greenheart and Lancewood Fly and Bait rods are most complete and up-to-date, varying in price from \$10.00 to \$30.00. They weigh from 3 to 6 oz. and are from  $8\frac{1}{2}$  to 10 ft. long.

We make no specialty of cheap rods but carry a few costing from 50 cents up to \$5.00.

We carry a full line of Bristol Steel rods, both in Fly and Bait. Salt water tackle we have a full line.

**REELS.** We are the Eastern Agents for the celebrated "Gayle" Kentucky Reels and carry a complete line of these, and our line of Vom Hofe's Reels includes the very latest models.

**LEADERS.** We pride ourselves on our Leaders. These are all made especially for us from the best imported gut, selected by experts in the business.

**FLIES and HOOKS.** Our Flies are all tied by experts to our special order, with selected gut, and these must not be confounded with the cheap products offered in this market.

We do not sell factory tied hooks on gut, but all our hooks are tied to selected gut to our orders.

**ARTIFICIAL BAIT.** We import all the different kinds of Minnows, Frogs, Grasshoppers, and make it our business to get the very best that money can buy.

The "**Silver soldier**" bait, for which we are the Sole Agents, is the most killing of all artificial baits. This is made in 3 sizes. Large for Striped Bass, Weakfish, Sea Bass, etc. Medium size for Lake and Salmon Trout, Black and Oswego Bass, Pickerel, etc. Small for Brook Trout, Bass, Pickerel, Perch, Sunfish, etc.

Of Silk enameled, braided oiled silk, and linen lines, Tackle Books, and Boxes, Baskets, Rod and Reel Cases, Bait Pails, etc., we carry a full line.

## VON LENDERKE & DETMOLD,

318 BROADWAY,

NEW YORK CITY.

# The Disappointments of a Fisherman.

THERE are at best many disappointments that must be suffered in silence and make "liars" of all men. Flooded streams happen, low streams occur and East winds do blow, nor can the fisherman control these things. Worse still these conditions often exist when he is actually fishing and he may have only three or four days at that particular time in which to fish. Thus some morning, duties call him home, and as he starts he finds that the torrents have ceased, the streams become normal, and the warm sun, as he drives across the bridge, embitters the day. On the other hand the reverse of these disagreeable things is known to all anglers. Placid brooks, dancing sunbeams and the joys that come with the rise of the trout furnish him with memories glorious, lasting until he can go again. The ingenuity of man has provided him with the wherewithal to bring the fish to his net. Competition, however, has done much to do away with "merit" in the manufacturing of fishing tackle. This applies to rods, lines, reels, leaders and flies, articles that even the expert can know little of until the test is made; and then comes the disappointment of the fisherman, should his tackle go bad. The selection of his tackle the fisherman can control. "Avoid cheap tackle" is good advice. Cheap tackle and bad weather are a combination that tends to make back-sliders of good men. The articles listed here will stand the test.

## Crawfordsville (Ind.) Gun Club.

THE attendance at the Crawfordsville tournament, March 23 and 24, was not as large as was anticipated, owing to the bad weather which prevailed for some days previous.

The club has grounds containing about eight acres and all conveniences for accommodating a crowd. The grounds are within a short walk of the center of the city. Mr. John Dietrich is superintendent, and performs his duties well. Dinner was served each day in the club house by Mrs. Dietrich, who is noted for her exceptional qualities as a culinary artist.

The targets were thrown at least 60yds, and, aided by the wind, were so swift that few were centered, and many were badly dusted. There were no complaints of "easy targets" at this tournament, as has been the case betimes in the past.

### March 23, First Day.

The first day was dark and windy. Twenty-eight shooters took part, twelve shooting the entire programme of 215 targets. Wiggins was high gun with 192. Lord second with 190. Moeller and Head third with 187 each. Scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	Total.

\*Trade representatives.

### March 24, Second Day.

The second day was partly cloudy, the air close and oppressive. A strong variable wind made the targets very erratic. Twenty shooters took part, thirteen shooting the entire programme. R. Trimble was high gun with 202 out of 215; Wiggins second, 200, and Clark third with 196. Scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	Total.
Targets:	10	15	20	15	20	15	20	15	20	15	20	15	20	202
R Trimble	9	13	19	14	20	14	20	14	20	13	19	14	13	200

Hamilton .....	Hansen .....
Outset .....	..

Easter Monday a team from the Old Reliables, the St. Hubert Gun Club, of Ottawa, Ont., will tackle the Montreal team for the Montreal trophy, and we may look for a good score by the winning team, as there will be two strong teams in the contest.

## Awosting vs. Poughkeepsie.

NEW PALTZ, N. Y., March 21.—The shoot of the Awosting Gun Club had two interesting, well-contested team matches, and ranks with the best shoots of the club in point of importance. Capt. Traver, of the Poughkeepsie Club, made high average, and Snyder, of the home club, was second. In the sweepstake event, Mr. W. Moore, of the home team, was high with a full score. In the team events, each man shot at 25 targets. The scores:

First event, Rosendale vs. Awosting:	Rosendale.	Awosting.
Capt. Slater .....	19	H. Hasbrouck .....
Smith .....	7	Moore .....
Delaney .....	12	W. Hasbrouck .....
Bedford .....	15	Benjamin .....
Springer .....	14	Snyder .....
Van Ostrand .....	14-81	Adams .....

Second event, Poughkeepsie vs. Awosting:	Poughkeepsie.	Awosting.
Capt Traver .....	21	Strong .....
Winans .....	16	Snyder .....
A J Du Bois .....	16	Capt Johnston .....
Marshall .....	16	Slater .....
Bissing .....	19-88	W Hasbrouck .....

Sweepstakes, 10 targets: Moore 10, Traver 9, Marshall 7, Winans 7, Bissing 7, W. Hasbrouck 7, Snyder 6, Johnston 6, A. J. Du Bois 6, Cassidy 4, Adams 3.

Capt. Traver won the fourth event, 15 targets, with a full score. Snyder won the fifth event, 25 targets, with a score of 19.

## Bristol Gun Club.

BRISTOL, Tenn., March 23.—The day was very fine. Some of the members were resting over from the shoot held on Monday, when the U. M. C. squad were here. Messrs. F. B. Pond and J. H. Bryan are new members. Mr. W. Gump was a visitor. The scores:

Targets:	25	25	25	25	25	Total.
A M Hatcher .....	23	25	23	24	24	119
A G Keller .....	25	24	22	20	23	114
A M Cumley .....	22	23	22	21	23	111
H A Arrants .....	24	23	22	23	..	92
Dr S W Rhea .....	22	23	22	23	..	90
Justin King .....	24	23	21	22	..	90
W H Hicks .....	20	21	20	22	..	83
W B Kilgore .....	20	21	19	21	..	81
A S McNeil .....	21	22	..	..	..	..
F B Pond .....	12	16	20	..	..	..
J H Bryan .....	7	11	..	..	..	..
W Gump .....	9	16	..	..	..	..

S. W. RHEA, Sec'y.

## New York Athletic Club.

TRAVERS ISLAND, N. Y., March 26.—The main trophy event was a handicap at 25 targets, and Bechtel was high with a score of 23, though on actual breaks, he tied with Greiff, scratch, on 21.

The scores: Borland (3) 22, Greiff (0) 21, King (6) 21, Bechtel (2) 21, Barnes, (1) 21.

The second event was a special cup contest, at 50 targets, handicap allowance added. The scores: Bechtel (9) 45, Borland (8) 43, Greiff (3) 39, Barnes (9) 34.

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6
Targets:	15	10	10	25	10	..	Targets:	15	10	10	25	10	..
Greiff .....	15	7	8	6	..	..	Barnes .....	9	6	9	6	17	8

Borland .....	14	5	9	6	19	..	..	..	..	..	..	..	..

\*Five pairs.

## Worcester Sportsmen's Club.

WORCESTER, Mass., March 24.—At the annual election of the Worcester Sportsmen's Club, which was held last evening, at my office, the following officers were elected: President, E. C. A. Becker; First Vice-President, Dr. J. M. Stanley; Second Vice-President, George Williams; Secretary, Harry M. Winchester; Treasurer, F. S. Blanchard.

To act in connection with these on the executive committee. Messrs. E. F. Dakin, F. A. Blake, J. A. Underwood, H. E. Jaques.

The report of the treasurer for the past year showed that the club had cleared up their entire debt of about \$250, which it had a year ago paid; \$100 in prizes were paid at one of their shoots this season, and that it has a little money in the treasury at the present time, with not a dollar of indebtedness. We hope during the present year to get the club into active working order as soon as possible, and expect to have quite a successful season of it.

As this is the beginning of our business year, and I am exceedingly anxious that the club shall be a success during the season, any suggestions that your might offer whereby we can promote the interests of the club will be most thankfully received.

E. C. A. BECKER.

## Rohrer's Island Gun Club, Dayton, O.

DAYTON, O.—Twenty shooters took part in the regular weekly handicap medal shoot on March 23. Four tied on full scores. The shoot-off was an interesting contest, and resulted in the victory of G. W. Gerlaugh.

The bridges are up, the club house is in the best of shape, and the grounds are in fair condition. A strong wind prevailed.

Medal shoot, 25 targets, handicap of extra targets to shoot at, number shot at in parentheses: Wm. Kuntz (35) 27, C. F. Butler (35) 27, J. Schaerf (35) 26, J. W. Gerlaugh (29) 26, M. Ford (34) 24, P. Hanauer (28) 23, H. Nohr (29) 22, J. Sapp (35) 21, C. Ballman (32) 22, G. Rohrer (30) 21, W. Apple (35) 20, H. Oswald (32) 18, J. Donohue (30) 16, H. Hales (35) 16, A. Landis (35) 16, Doc. Stettler (35) 16, J. Eisen (35) 14, J. Spohr (35) 14, Brown (35) 14, W. Kette (35) 10.

Shoot-off No. 1: Gerlaugh (10) 10, Schaerf (10) 10, Kuntz (14) 10, Butler (13) 9.

Shoot-off No. 2: Gerlaugh (6) 5, Schaerf (7) 5, Kuntz (7) 5.

No. 3: Under the rules, those shooting at 7 targets shot off miss-and-out: Schaerf 2, Kuntz 1.

Final, 5

**FOREST AND STREAM PUB. CO., 346 Broadway, New York.**

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR, 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, SATURDAY, APRIL 9, 1904.

VOL. LXII.—No. 15.  
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

## "UNEXPLORED" LABRADOR.

THE lonely death of Mr. Hubbard, of which much has recently been heard, is full of pathos, just as is the lingering, lonely death of any helpless human being. Nothing is sadder than to read of a little child, playing about the farmhouse and wandering off into the forest, to be found dead days afterward, perhaps within sight of its home. The tale of the Babes in the Wood has appealed to human beings for many hundreds of years.

It is not unfair to compare the members of the Hubbard party with little children lost in the woodlot next to the farmhouse, perishing of hunger, while, as Dr. Morris showed in his letter last week, meat and drink were all about them, if only they had known where to look for it.

Since these young men started off with insufficient food, determined to live on the country, and since they failed to provide themselves with the knowledge and the means necessary to procure that food—to capture game and fish, to gather berries or dig roots—it was a foregone conclusion that if they left the beaten paths they must perish. Of the uncertainties of travel in a wild country they were apparently quite ignorant, and they did not fear the dangers they did not know, nor have any idea of what they might meet with.

It is well understood that reindeer are uncertain in their migrations, and that even when deer are plenty in a country they do not always come up to travelers and stand, waiting to be shot.

Few things are more melancholy than to see a bright, strong, courageous young life blotted out, without reason and to no purpose. Such a death was Mr. Hubbard's.

People who know nothing of the region are accustomed to talk of Labrador as an unexplored wilderness, when, as a matter of fact, it has been known for not far from 200 years. Delisle's map of 1703 is a fairly good one.

The two great rivals in the fur trade, the Hudson's Bay Co. and the North West Co., came to an agreement and consolidated in 1821, and soon after nine or ten trading posts were established and maintained in Labrador, of which three are still kept up. In 1849 John McLean published an account of his journeyings there undertaken between 1838 and 1840. Again in 1862 H. Y. H. Hind, for the Canadian Government, did some exploring there and published two large volumes, and in 1870 and 1871 Geological Survey parties explored the country between Lake St. John and Lake Mistassini. From 1884 to 1888, and again from 1893 to 1897, and since, Mr. A. P. Low, of the Dominion Geological Survey, was engaged in traveling backward and forward through the district, and in 1887 and 1891 Messrs. Holmes, Carey, Cole, Bryant and Kenaston made expeditions to the country.

Ignorant of all this, it has long been the practice of persons whose explorations were confined to regions like the Adirondaeks, to talk of Labrador as if it were absolutely unknown—as much so as northern Greenland or the islands of the Arctic Sea—and they have represented the difficulties of travel there as equal to those of any Arctic expedition. Many of our readers will remember the fabulous tales told years ago of the wonders of Lake Mistassini and of the difficulties of reaching it, and the way in which these stories were refuted by persons of experience in the North.

Meantime, for near a hundred years, generations of white and Indian residents of Labrador have been traversing it by routes of travel as well known there as Pennsylvania Avenue is to a Washingtonian, or Clark street to a Chicagoan. Maps have been made of the country, which are obtainable at the office of the Dominion Geological Survey at Ottawa, and from the Hud-

son's Bay Company's posts, and at these posts can usually be had guides absolutely acquainted with the country. Labrador is not unexplored.

## IMPROVED POSTAL SERVICE.

THE Postal Progress League is an organization for the promotion of a better postal service. The specific reform to secure which the League is working is in the transmission of merchandise. In this branch of our postal service the United States is far behind that of other nations. Thus, our rate on merchandise or fourth class mail matter is one cent per ounce, with a weight limit of four pounds, for which the postage is sixty-four cents. In Germany the limit is eleven pounds, on which the postage is twelve cents. Like proportions hold in comparison of the American rates with those of other countries. We are as far behind the rest of the earth in international merchandise postal rates. Of fifteen nations represented at the World Letter-Post-Union at Paris in 1878, the United States was the only one which refused to approve the organization of an International Parcels-Post-Union, a service which was put into operation in 1880, without our co-operation. "To-day this service covers nearly all the civilized world outside of the United States." What this means in the loss of mail orders for American goods for the foreign markets is hinted in the estimate of Consul Louis H. Ayme in Guadeloupe that the sum so lost to American firms in the West Indies alone is not less than \$2,000,000 a year.

The loss of domestic business due to excessive transportation rates is also a sum vast beyond reckoning. The postal limit of four pounds and the high rates drive the shipper to the express company, and the exorbitant charges exacted by the express are a constant repression of business. The Postal Progress League proposes a new classification of postal matter, putting the present third class (books) and fourth class (merchandise) together, with a weight limit of eleven pounds, and rates as follows: "On parcels up to three ounces, one cent; over three ounces up to six ounces, two cents; over six up to nine ounces, three cents; over nine up to twelve ounces, four cents; over twelve ounces up to one pound, five cents; for each additional pound or fraction thereof, two cents, making the rate on an eleven pound parcel, twenty-five cents. No parcel shall be more than three and one-half feet in length or occupy more than two cubic feet of space." Under this rate a dealer in New York could mail a shotgun to a customer anywhere in the country for a quarter; and a fishing rod would go for postage so ridiculous that it would not be thought of by seller or buyer.

The business man who sends goods by mail, or who might send them, may figure out for himself what such a postal system would mean to him in the course of a year's trade. The Postal Progress League may well have the active and concerted support of all firms whose advertisements appear to-day in FOREST AND STREAM.

## FLIES.

THE sleeping sickness is an African disease in which the patient first shows indolence, then sinks into a lethargy, falls asleep and dies. The cause of the disease, which has long puzzled European investigators, has now been traced to a tsetse fly, which communicates the deadly microbe to man. In some regions the fly gets the microbe from big game, the koodoo, impala, buffalo, wildebeest, and other species; and when the game has been killed off by the hunter's gun the sleeping sickness disappears. This shows that there are regions—away across the seas in Africa—where game extermination is not an unmixed evil. Indeed, if the tsetse depends on the large game for its bad offices, a West African decree might well go forth putting a bounty on the head of every koodoo in the land.

Another fly story comes from Ceylon, and illustrates the often most curious and unexpected complications which follow a disturbance of the balance of nature. A certain lake breeds a species of pestilential fly, which of late has become a nuisance. To aid to avert the plague the municipal authorities have forbidden fishing. They have reasoned it out that the flies, which are bred in the water, are in their early stages of development food

for the fish; of recent years fishing has increased, both rod fishing for sport and net fishing to supply the demand caused by a growing taste for fish food; and as the fish have decreased, the flies have increased. The theory is plausible. In America we have discovered that the ornamental ponds in our gardens, which are mosquito breeders, may be robbed of their evil agency if they are stocked with goldfish, which feed on the mosquito larvæ. Thus in the intricate and interdependent ways of nature the humblest chub may serve its small mission of making the earth a pleasanter dwelling place for man.

## THE COMING AGE.

IN our shooting columns, Mr. Fred A. Olds describes the systematic methods adopted at Pinehurst, N. C., to provide a game supply for northern visitors to that resort. Not content with the haphazard ways of the past, advertising for sportsmen guests and trusting to the chance stock of birds to give them shooting, the enlightened and provident management of Pinehurst has put into operation an extensive breeding and fostering enterprise, to insure a renewing supply of native and introduced birds. With thousands of acres protected and with well devised methods of restocking, the Pinehurst shooting attractions appear to be permanently assured.

A similar plan has been adopted at Fortress Monroe, Va., where the Hotel Chamberlin has set apart 10,000 acres of shooting grounds for the exclusive use of its guests; and where approved methods have been adopted to insure a continuing supply adequate to meet the demand upon it.

These two preserves in North Carolina and Virginia are of more than casual interest and significance. They are the early examples of what before long must be a large number of similar adjuncts of autumn and winter resorts. No one can question that the capital which has been expended in the Pinehurst and Fortress Monroe preserves has been well invested; nor can there be any question that the managers of other resorts will in growing numbers follow the examples here set. The field of open shooting is everywhere on the wane; the sportsman tourist must, in corresponding degree, depend upon preserves; and he will favor the resorts which can assure him sport. Thus will it be in the coming age.

## AN ALASKA DOG CASE.

THEY change their sky but not their mind who cross the sea, runs the old proverb; but it is not always true, for our estimates of values change with our surroundings and circumstances. In thickly settled communities, where there are railroads, trollies, automobiles, bicycles and sundry other conveyances, we do not set such store by a horse as to hang the horse thief; but in a new country where every man depends on his horse for travel, the horse thief is shot or strung up with short shrift. So as to the dog, Maine and Alaska differ on this point to a degree to be expressed only by the expanse of the continent which lies between them. In Maine the courts have held that a dog is a wild animal, *feræ naturæ*, and not entitled to protection as property. In Alaska, a man has been sentenced to nine months at hard labor and to pay a fine of nearly \$300 for stealing a dog, and a cur dog at that. The case was appealed, but the higher court sustained the decision, in a long opinion setting forth the value of the dog as a draught and pack animal in the far north; here, said the court, the dog "is a chattel, and next to man is the most important factor in the past and present history of the country." From the Alaska courts the case has been taken to the Supreme Court of the United States, the appellant basing his appeal on three grounds: First, that his sentence is illegal because the crime for which he was sentenced is not named in the Civil Code for Alaska, under which he was tried; second, because the Justice of the Peace who tried him was without power to condemn him to hard labor; and third, because a dog is not, under the Alaskan code, subject for larceny.

FROM Caribou, Me., comes a report that Bald Mountain, in the Tobique Valley, has disappeared, and in its place is a lake. The Maine reports from there will probably read, "Hunting not so good this year, but fishing the best ever known."

# THE SPORTSMAN TOURIST

## Trails of the Pathfinders.

V.—Alexander Mackenzie.

### To the Frozen Ocean.

Of the early explorers of the north none is more celebrated than Alexander Mackenzie, the first man to penetrate from the interior to the Frozen Ocean, and the first in the farther north to cross the continent. Among the leaders of the northwest he is pre-eminent as a discoverer, and of the early northmen his name is the most often mentioned. His journeyings—that to the Arctic made in the year 1789, and that across the continent in 1792 and 1793—are told of in a splendid volume, published in London in the year 1801, entitled, "Voyages from Montreal and the River St. Lawrence, Through the Continent of North America to the Frozen and Pacific Oceans, in the Year 1789 and 1793." Its publication was soon followed by the conferring of knighthood on the author.

The earliest explorations into the interior of this continent were all of them by water. By water, the first missionaries pushed their way up the St. Lawrence and through the Great Lakes, and then crossing over by short portages to the Mississippi, journeyed down that great highway of more modern times until they came to the Gulf of Mexico. Later, missionaries and explorers and traders, still from Montreal, followed the water trail up the Great Lakes to the Grand Portage, and thence pushed westward until they reached Lake Winnipeg, the Saskatchewan, and all that broad country which lies east of the northern Rocky Mountains. The frail birch canoe carried their scanty provisions and their goods for trade, and returned laden to the gunwale with rich packages of furs. Later still, when the people of the United States began to push westward, it was down the Allegheny and the Ohio—still largely by water—that their journeyings were conducted.

Alexander Mackenzie was fur trader, and he made his way westward, by the usual route, to the Grand Portage, Lake Winnipeg, then up the Saskatchewan and across to Fort Chipewyan, on the Lake of the Hills—now known as Athabaska Lake. Though the journey was long, it was full of interest; the country had been seen by few white people, it abounded in life of many descriptions, all wild, and for the most part undisturbed. He reached Fort Chipewyan, with ninety or a hundred men, and without any provision for their sustenance; but the lake was full of fish, its shores abounded with game. The autumn fishing was successful, and the cold during the winter intense, so that fish were caught in great numbers, and frozen, remaining good until spring. During the spring and fall great numbers of wild fowl resorted to the lakes, and immense numbers were killed, so that for short terms the geese supported the life of the traders.

From the earliest settlement of Canada the fur trade had been regarded as of the greatest importance to the colony, but the settling of eastern Canada soon made fur hunting profitless there, and the French pushed further and further west in search of furs. Hence had arisen the class of *voyageurs*, known also as *coureurs des bois*, who pushed into the Indian country, each carrying a little stock for trade, collected furs from the Indians, brought them back, and turned them over to the merchants who had furnished them their goods. At first their journeys were short, but, as time went on, and they pushed further and further in search of new and richer lands where fur was to be had, their trips lasted longer and longer, until at length they extended to a year or more. These voyageurs were as improvident as the Indians themselves, and, during the short periods that they spent in civilization, they commonly squandered in dissipation of one sort or another all that they had received for the hard labor of a year. Effort by the Church was made to stop their operations, on the ground that their dissipation and licentiousness was likely to corrupt the natives, and to bring the Christian religion, of which they were supposed to be representatives, into disgrace. These efforts were fruitless; and until the close of the fur trade, many years later, the voyageur continued to exist, and to play his important part in the commerce and in the development of the far north.

In 1783 and 1784, the Northwest Fur Company was established, in opposition to the Hudson's Bay Company, and included among its partners many of the most celebrated traders of the north. Mackenzie had for five years been employed in the counting house of Messrs. Gregory and McLeod, and was admitted a partner in the Northwest Company, and proceeded to the Indian country in 1785. How enormous the trade that this company carried on is shown by a list of the returns for a single year, which show 106,000 beaver skins, 2,100 bear, 4,600 otter, 17,000 musquash, 32,000 marten, 6,000 lynx, 600 wolverine, 1,650 fisher, besides a less number of fox, kitfox, wolf, elk, racoon and deer skins, and buffalo robes. Mackenzie was astronomer as well as trader. He was also an observer who considered the economic possibilities of the country, its fauna and its flora, and especially the game, as well as the human inhabitants.

Mackenzie started from Fort Chipewyan, on the south

side of the Lake of the Hills, June 3, 1789, in a birch-bark canoe. His crew consisted of four Canadians, a German, and two Indian women, an Indian interpreter, known as English Chief, and his two wives journeyed in a small canoe, while two young Indians followed in a third. English Chief had been one of the followers of a chief who was with Mr. Hearne on his explorations to the Coppermine River. A fourth canoe, in charge of one of the clerks of the company, Mr. Le Roux, accompanied them, carrying a load of trade goods and presents, together with a part of the provisions and ammunition of the expedition. Their route was without much adventure until they reached Slave Lake, still covered with ice, somewhat melted near the shore. The gnats and mosquitoes which had troubled them during the first few days that they had been on their way, here left them. Mackenzie says: "The Indians informed me that at a very small distance from either bank of the river are very extensive plains frequented by large herds of buffaloes: while the moose and reindeer keep in the woods that border on it. The beavers, which are in great numbers, build their habitations in small lakes and rivers, as in the larger streams the ice carries everything along with it during the spring. The mud banks in the river are covered with wild fowl, and we this morning killed two swans, ten geese, and one beaver, without suffering the delay of an hour; so that we might have soon filled the canoe with them, if that had been our object." That same day they reached the house erected on Slave Lake by Messrs. Grant and Le Roux in 1786, and here they stopped and pitched their tents, as it seemed likely that the ice would detain them for some time. The nets were set, and many fish were caught. Berries were already ripe, and the women were occupied in gathering them, while wildfowl were breeding, and they collected some dozens of their eggs. On Monday, June 15, the ice broke up near them, and cleared a passage to the islands opposite; and at sunset they embarked and crossed to them, where they stopped to gum their canoes, and the next day set out again, following the shores of the lake. Ice interrupted their passage from time to time, but they supplied themselves with food by means of their nets.

On the 18th, two of the hunters killed a reindeer and its fawn. The ice continued to hinder them, but they worked along slowly. On one of the islands that they passed reindeer were seen, and seven killed. The island was named Isle de Carre Boeuf. Here occurs a somewhat unusual usage of the term pemmican, described to be "fish dried in the sun, and afterward pounded for the convenience of carriage." The more common meaning of the term is, flesh dried and pounded and mixed with grease, as buffalo pemmican, elk pemmican, caribou pemmican. On Tuesday, the 23d, the explorer met with a little camp—three lodges—of Red-Knife Indians, so called from their copper knives. They informed the explorer that others of their people were near at hand. These Indians—now known as Yellow-Knives—are of Athabaskan stock, thus allied to the Hare, Dog-rib, and Chipewyan peoples, also to the Navajos and Apaches of the south. They possessed some furs, and Mr. Le Roux secured from them eight packs of good beaver and marten skins. They seemed to know little or nothing about the country to the north, and Mackenzie's inquiries brought forth no useful information.

The ice in the lake was still troublesome, though breaking up fast. On Monday, June 29, they entered the river by which Slave Lake discharges to the north, and made good progress down it. On both sides of the river the Indians reported that there were extensive plains, which abounded in buffalo and moose-deer. By this time the wildfowl had begun to molt, and the Indians no longer troubled to shoot them, but pursued them in their canoes, killing them with sticks, or capturing them alive. On the 1st of July, keeping on down the river, they made a cache of provisions on an island. By this time they had come in sight of high mountains to the west, barren and rocky at the top, but well wooded on the slopes.

On July 3, the current was stronger, and their progress still more rapid. They saw frequent signs of camps, but none of very recent occupation; but on the 5th, smoke was seen on the north shore of the river, and as the canoes drew nearer, natives were discovered running about in apparent alarm. Some took refuge in the woods; others hurried to their canoes. The hunters landed, and calling out to the Chipewyans in their own tongue, assured them that the party was a friendly one, and after some difficulty the Indians became convinced that there was no danger. These were five families of two different tribes, the Slave and the Dog-rib. Mackenzie offered them the pipe, though it was quite apparent that they were unacquainted with tobacco, and also gave them a drink of grog, which also seemed new to them. However, they appreciated the beauties of knives, beads, awls, rings, hatchets, etc., and soon became so trustful of the party that "They became more familiar even than we expected, for we could not keep them out of our tents; though I did not observe that they attempted to purloin anything."

"The information that they gave respecting the river had so much of the fabulous that I shall not detail it; it will be sufficient just to mention their attempts to

persuade us that it would require several winters to get to the sea, and that old age would come upon us before the period of our return; we were also to encounter monsters of such horrid shapes and destructive power as could only exist in their wild imagination. They added besides that there were two impassable falls in the river, the first of which was about thirty days' march from us."

While these stories did not affect Mackenzie, they did influence his Indians, who were already tired of the voyage, and anxious to turn back, and it required some effort to convince them that it was better to go on. One of the natives was persuaded to accompany them as a guide, and though he afterward wished to withdraw, he was not allowed to, and with some ceremony he finally took his unwilling departure with the white men. These people used bone knives, were tattooed on the face, wore a goose quill, or a small piece of wood, through the nose, and used vessels woven of wappat—the roots of the spruce or tamarack—in which they boiled their food by hot stones. Arrows were pointed with horn, flint, iron, or copper, and their axes were made of stone. They obtained from the neighboring Red-Knives and Chipewyans, by barter for skins, small pieces of iron, from which also they made knives. Their awls were of iron or horn.

The guide whom they took from this country was anxious to return to his people, and had to be watched constantly to prevent his escape. As the explorers passed on northward they were constantly in sight of the ridge of snowy mountains to the west. "Our conductor informed us that great numbers of bears and small white buffaloes frequent those mountains, which are also inhabited by Indians." These white buffalo were, beyond question, the white goats which inhabit the mountains to the west of the Mackenzie River. Being animals unknown to the interpreter, who came from the lower country, they would be described as hoofed animals, shaggy, with a hump on the shoulders, and a beard, and with black horns; and thus might well enough have been described as white buffalo.

The next day more natives were met with, who, as usual, fled on the approach of the white men. One old man, however, did not run, but approached the travelers, "and represented himself as too far advanced in life, and too indifferent about the short time he had to remain in the world, to be very anxious about escaping from any danger that threatened him; at the same time, he pulled his gray hairs from his head by handfuls to distribute among us, and implored our favor for himself and for his relations. Our guide, however, at length removed his fears, and persuaded him to recall the fugitives, who consisted of eighteen people." These joyfully received the presents of beads, knives and awls, which were offered them, and overwhelmed the explorers with hospitable attentions, giving them food, which was gladly accepted. They told of dangers to be met with further down the river, and some of the natives accompanied Mackenzie's people to point out the safest channel of the rapids, which they declared to be just beyond; but as a matter of fact there were no rapids. The river was about three hundred yards broad, and Mackenzie's soundings gave fifty fathoms of water.

Along the river there were almost continuous encampments of Indians, all of whom were spoken to, and all of whom traded food, such as hares, ptarmigan and fish, to the travelers. The last parties met with were Hare Indians, who told wonderful stories of danger, and of fearful things to be met on the river; and these terrors were not distant, for according to the Indians, behind an island opposite their camp dwelt a spirit in the river which swallowed every person that approached it. Unfortunately, Mackenzie had no time to cross to the island and see whether it would swallow him.

The people met a little further along were more attractive than those seen earlier, many of whom had been sick, while these were "healthy, full of flesh, and clean in their persons." Their ornaments and utensils did not differ greatly from those further up the river. They had a little iron, which they obtained from the Eskimos; their arrows were made of very light wood, and winged with two feathers, while their bows were of the Eskimo type, of two pieces spliced with sinew. Their shirts were not cut square at the bottom, but tapered to a point from the belt downward as low as the knee, before and behind, and these points were fringed. Over the breast, back and shoulders their shirts were also fringed, the fringe being ornamented with the stone of a berry, which was drilled and run on each string of the fringe. The sleeves of the shirts were short and wide, and long mittens covered their hands and arms. Their leggings were like trousers, and the shoes sewed to the leggings.

These people told them that it would take ten more nights to reach the sea, but after three nights they would meet the Eskimo. The reports of some guns discharged as the canoes pushed off, greatly alarmed the Indians, and the guide that they had hired at this place seemed inclined to leave them, until advised that the noise was a signal of friendship. The guide and two of his companions who accompanied them on their journey were merry fellows, singing not only their native songs, but others in imitation of the Eskimos'. Not satisfied with singing, their guide proceeded to dance, and transferring

himself to the white men's canoe, he danced in it, to their no small alarm lest he should upset it.

Mackenzie now began to be a little uneasy, for his provisions were growing scant, his hunters discouraged, and his men generally seemed anxious to return. Some of them declared that they must turn back, and the explorer was obliged to satisfy them by the assurance that he would go forward only seven days more, and if he did not then reach the sea, would return. They had now reached latitude 68°, and the sun was continually above the horizon. On the 11th they met an abandoned camp of Indians, where were seen parts of the fragments of three canoes, and places where oil had been spilt. Later, an Eskimo hut was found, and about it a great deal of property. Now, they began to see fresh tracks of the Eskimos on the beach. According to their guide, they were approaching a large lake, where the Eskimos lived, and in which they killed large fish found there, which Mackenzie presumed must be whales. White bears, and other large animals not identified from the description, were told of as well as the Eskimo canoes, which could conveniently carry four or five families.

On the 12th, in the morning, they landed where there were four huts. "The adjacent land is high and covered with short grass and flowers, though the earth was not thawed about four inches from the surface, beneath which was a solid body of ice. This beautiful appearance, however, was strongly contrasted with the ice and snow that was seen in the valleys. The soil, where there is any, is a yellow clay mixed with stones. These huts appear to have been abandoned during the last winter, and we had reason to think that some of the natives had been lately there, as the beach was covered with the tracks of their feet. Many of the runners and bars of their sledges were laid together near the houses in a manner that seemed to denote the return of the proprietors. There were also pieces of netting made of sinews, and some of bark of the willow. A thread of the former was platted, and no ordinary portion of time must have been employed in manufacturing so great a length of cord. A square stone kettle with a flat bottom also occupied our attention, which was capable of containing two gallons; and we were puzzled as to the means these people must have employed to have chiseled it out of a solid rock into its present form."

When they had satisfied their curiosity they were about to re-embark, but were puzzled to know where they should go, or what channel they should take. The lake was quite open to them to the westward, and the water very shallow, so much so that it was impossible to go quite close to the shore. They therefore went to an island, where they camped, and having set the net, Mackenzie and his interpreter climbed to the highest part of the island, from which they discovered solid ice, extending from the southwest by compass to the north and to the eastward. To the east were many islands.

As they passed along, on their walk of exploration, they came upon a number of white partridges, now becoming brown—the ptarmigan—and beautiful plover, which were breeding. There were also white owls, and presently they came upon an Eskimo grave.

Even the Indians and the Canadians, seeing that the time for turning back had almost come, began to regret that they must return without coming to the sea, not knowing that they were already upon it. For the next two or three nights they were several times obliged to move the baggage to keep the water from flowing about it, and at last Mackenzie concluded that this was the tide that was rising and falling. One morning many large animals were seen in the water, and Mackenzie recognized them as whales, and ordered the canoe to start in pursuit. Fortunately, just at this time a fog arose and the whales were not overtaken. These were white whales, and the Indian guide stated were one of the principal sources of food for the Eskimo.

All Mackenzie's efforts to meet these northern people failed, and on Thursday, the 16th of July, the canoes entered the river and began the return journey. They were still subsisting largely on the wildfowl that the Indians killed, and the fish that they took in their nets, and these were barely enough to support them. Indeed, on some days the wildfowl were so shy that they could not be approached, and this obliged them to draw more or less on their store of provisions. However, on the 18th, and before they had gotten away from the country of the Eskimos, the hunters killed two reindeer, a very fortunate addition to their supply of food. But this killing of the reindeer was not without its unfortunate side, for it so alarmed their guide that he deserted that night. However, geese were plenty, and on the following day the hunters killed twenty-two, and the next day fifteen, and four swans.

They were now obliged to resort to the laborious and slow towing line to ascend the river. They met a party of Indians, among whom was the brother of the guide who had recently deserted, and Mackenzie sat up all night to watch them. They were greatly interested when they saw him writing, wondering what he was doing. As the night drew on, some women came from the forest to the camp, and after remaining for a short time, went away. "Those who remained immediately kindled a small fire and layed themselves down to sleep around it, like so many whelps, having neither skins nor garments of any kind to cover them, notwithstanding the cold that prevailed. My people having placed their kettle of meat on the fire, I was obliged to guard it from the natives, who made several attempts to possess themselves of its contents; and this was the only instance I had hitherto discovered of their being influenced by a pilfering disposition. It might perhaps be a general opinion that provisions were a common property."

From here they continued to tow the canoe up the river. Some Indian huts seen were built of drift-wood. On the slope of the beach, and on the inside, earth was dug away to form a level floor. Within these huts were drying scaffolds, covered with split fish, and fires made in different parts of the hut warmed and dried the air, and hastened the operation of drying. The Indians told him of the Eskimos who dressed like themselves, wore their hair short, and had two holes perforated, one on each side of the mouth, in line with the under lip, on which they placed long beads—the labrets, so well known as ornaments of the primitive Eskimos. They reported the animals of their country to be reindeer, bears, wolver-

ines, martens, foxes, hares, and white buffaloes, and that the latter were only to be found in the mountains to the westward. On the journey up the river the towing line was much in use, but often, when the wind was north, it was possible to use the sail. For six days on this southward journey the party had not touched any of their provision stores, but in this time, Mackenzie says, they had consumed two reindeer, four swans, forty-five geese, and a considerable quantity of fish. "I have always observed that the northmen possessed very hearty appetites, but they were much exceeded by those with me since we entered this river. I should really have thought it absolute gluttony in my people, if my own appetite had not increased in a similar proportion."

He now began to hear, from the people whom he met, of a great river to the west of the one he was traveling on, and beyond the mountains, perhaps the Yukon or the Fraser. But the country through which this river ran was inhabited by strange creatures. "The Indians represented them as being of gigantic stature, and adorned with wings, which, however, they never employed in flying; that they fed on large birds, which they killed with the greatest ease, though common men would be certain victims of their voracity if they ventured to approach them. They also described the people that inhabited the mouth of the river as possessing the extraordinary power of killing with their eyes, and devouring a large beaver at a single meal. They added that canoes of very large dimensions visited that place. These tales, however, they told not of their own knowledge, but from reports of other tribes."

It was at this camp that Mackenzie was obliged to shoot an Indian dog, which it was impossible to keep from interfering with his baggage, which, of course, contained the provisions. "It was in vain that I had remonstrated on this subject, so that I was obliged to commit the act which is just mentioned. When these people heard the report of the pistol, and saw the dog dead, they were seized with a very general alarm, and the women took the children on their backs and ran into the woods. I ordered the cause of this act of severity to be explained, with the assurance that no injuries would be offered to themselves. The woman, however, to whom the dog belonged was very much affected, and declared that the loss of five children during the preceding winter had not affected her so much as the death of this animal; but her grief was not of very long duration, and a few beads, etc., soon assuaged her sorrow."

On the way up the river, August 2, small springs of mineral water were observed, as well as lumps of iron ore, and finally, a "coal mine," or bed of lignite, on fire. The beach was covered with coal, and the English chief gathered some of it to be used as a black dye, to color porcupine quills. A little further on, the Indian hunters killed a beaver, whose fur was now beginning to grow long. Tracks of moose and reindeer were seen, but all of them old. Since the weather was growing cooler the reindeer would now leave the plains to come into the woods, for the mosquitoes were beginning to disappear. Though the river had fallen much the current was still very strong, and the work difficult. The weather was cold, and now their violent exercise scarcely kept them warm. The women constantly remained in the canoes, making moose-skin moccasins for the men, who as constantly wore them out, a pair lasting not more than one day.

On the 7th they saw two reindeer on the beach before them, but the Indians, quarreling to see which should be the first to get near them, alarmed the deer, which ran away. However, a female reindeer was killed, whose legs showed wounds, and it was supposed that she had been pursued by wolves, which devoured her young one. One of the young Indians took her udder, which was full of milk, and squeezing it over some boiled corn, ate the mixture with great relish.

On the 10th, accompanied by one of his young Indians, Mackenzie strove without success to reach the mountains which were seen on the southwest of the river.

For the last few days the hunters had been unsuccessful, killing only a beaver, a few hares, and a few waterfowl, but on the 13th they reached the island where they had hidden their pemmican on the way down, and raising the cache, found themselves once more in plenty. A little later they saw another camp of Indians, who, very much frightened, drew their canoes up on the beach and fled to the woods, leaving much of their property behind them. This was pounced upon by Mackenzie's Indians, who took his interpreter severely to task for his conduct. This brought on a more or less violent dispute, in the course of which the English chief declared that he would accompany Mackenzie no further, but would leave him and remain here. The Indian and all his relations wept bitterly, but after a few hours Mackenzie persuaded him to continue the journey, and propitiated him by a gift of rum.

On the 17th and 18th of August the hunters were more successful, and off the last day the English chief killed a buffalo, while a few waterfowl were brought in daily. They now found signs of a Cree encampment, and presently reached the entrance of Slave Lake. Coasting around this, often in heavy weather, they came upon Mr. Le Roux, from the fort there, and found that he had been somewhat successful in trading for skins, having five packs, principally of marten. Large game seemed abundant here, and the tracks of buffalo, moose, and reindeer were seen. On August 30 they reached Mr. Le Roux's house.

Here Mackenzie's Indians left him, on the ground that he traveled too fast for them, and that they feared they should be drowned if they followed so reckless a sailor. Mr. Le Roux's establishment was left on the 31st of August, and twelve days later, after many difficulties from storm and cold, they reached Fort Chipewyan, having concluded a voyage which had occupied one hundred and two days.

GEO. BIRD GRINNELL.

A ship in harbor weighs half the weight of its cargo, and its own weight is double half what it weighs if half its weight is counted as half its weight of cargo. The united weight of ship and cargo is more than 10,000 and less than 11,000 tons. What does the ship weigh when it leaves harbor? Answer—The anchor.

## Idle Hours.

THE blue smoke curls up in a thin wreath from the hot coals and glowing logs of the fire, toward the big pine trees that tower into the clear blue dome overhead, while the murmuring voice of the stream mingles in pleasant cadence with the appetizing sizzle of the little trout browning to a crisp in the long-handled frying pan. A wide, capacious, open camp filled with soft, spicy balsam boughs, offers a couch of fragrant comfort not to be surpassed by any other. The bright sunshine streaming down through the yellow-tinted leaves falls on the rough board table and benches set for the partakers of a meal in the woods. What a free, whole-souled, unaffected and natural life is this! We forget the world, and receive joyfully the balms and invigorating influences of the woods, living in the beauty and happiness of the present, thus becoming strengthened for the future.

Not far from our summer home was such a spot, with an amber brook, huge pines, an inviting open camp, and the wild, untouched forest surrounding; it is needless to say that visits to this place left memories of everlasting pleasure behind them, nor were the days anything more than one long hour of unstained happiness.

It was reached by a two-mile drive through the woods on a good wagon road; then a short walk brought one to where the pines souged above, the brook rippled around a point of springy leaf-mould that formed an ideal location for the camp and fireplace. This level bit of land was overgrown with fresh, delicate ferns, while a number of graceful yellow birches twined their roots in the rich soil or grew from a mossy rock in the stream. From the end of this small point two rough hewn logs stretched across a deep, clear pool, and once over the rustic bridge, one might walk down the brook on a wood trail that ended where a foaming cascade fell over a smooth, rounded rock, and boiled into another pool below. On every side was the wild virgin forest, and many times deer came within a short distance of the camp, while two mighty pine trees standing nearby were a crowning delight.

A soft northwest wind was blowing, and across the clear, deep-tinted blue of the sky sailed those white, gray-lined, Adirondack clouds; but here in the woods only the rustling murmur of the leaves above told that a breeze was stirring, for the smoke from the fire which Rob had just kindled hung in sunbeamed streaks between the trees.

"To-day we must go over to the stream" had been a proposition so readily accepted that here we were, two hours later in the morning, with pack basket filled with everything needful for an outdoor repast, and Rob, whose cooking powers, quaint wit and wood lore could not be done without. After fat, faithful Flora, a mare of unlimited merits, had brought us safely to our destination, driving from the road down to the camp on the rough, uncertain trail with ease and sure-footed care of an old-timer, I perceived Fred fumbling under the buckboard seat in evident search of something. "What are you looking for?" I questioned, my curiosity aroused. "Worms," he answered. "I wasn't coming over here without some bait, you can just believe. Ought to catch a few trout down stream, Rob?"

"Yes, you ought ter get some," returned Rob, as he arranged the "wood artist's" painting stool and outfit near the thick, mossy bank, where later on a sheet of canvas there appeared the yellow stream, rock and clashing birch of the reality. The "little lady," too, had brought her sketching materials, pen, ink and block in immediate use with a book of Shelley's fragrant poems resting beside her. I made up my mind without further ado. "I am going, too; but you can fish and I'll look on for a half hour or so before I come back to help fry the 'murphies' and make the toast," I said, addressing Rob. "Then if you get any fish we can have some for dinner," speaking to the angler who was adjusting hook and line and buckshot sinker to a birch rod he had cut.

"All right; come along," he returned; and off we started, stopping by the pool before crossing over, to throw a few big night-walkers to the half dozen trout that lurked in its cool, amber depths. We never fished for these or any others between this point and the falls, several hundred yards further on. The pool was not very deep, and the sun, striking on it now, showed clearly every yellow stone and old rotted log covering the bottom. Suddenly a small form shot out from under one of these dark, sheltering retreats, as a bright *fontinalis* darted in eager haste at the worm, twisting slowly downward. Seizing it greedily, he swam off, pursued by two or three other hungry, lively fish, that endeavored to snatch the dangling bait from his mouth. After passing over the bridge, we continued walking down the trail until we reached the rushing falls that marked the commencement of the fishing grounds. In many places where a strip of soft "muck" or sand bordered the brook, were the sharp, deeply sunk tracks of deer, and I have no doubt that the ungainly, thrilling imprints of some old Bruin's paws had marked it, too. A high knoll arose on the opposite side of the stream, a thick growth of balsam, spruce, pine and a few birches covering the steep incline, free from underbrush. "There goes a trout under the bank," said Fred, when, after scrambling over fallen trees, balancing on slippery moss-grown logs, plunging ankle-deep into several copious spring holes, we had reached a likely looking pool. Splash, slump! and I slid off a treacherous log into the wet, spongy muck, nearly losing my balance as I endeavored to get nearer to Fred's location, for we had become somewhat separated on this rough ground, each one picking his own way.

"Don't try and come across," he called to me, after I made a hasty retreat to a firmer position. "I nearly got mired myself, and each shoe feels as if there was a bucket of water in it."

Neither of us could resist a good laugh at our mishaps, for the day was warm, and such amusing incidents only added to the fun, not making us at all uncomfortable.

"Here's a good place," came a hidden voice from Fred's direction; and finding a well-beaten deer runway, I followed it down to the brook until I stood

within a few yards of the pool he was fishing. The amber water flowed windingly in and out among the thick alder bushes that hung and overshadowed it in many places; here the stream rippled over a shallow gravel bed, glinting and flashing in the sunlight, and then in a sweeping turn sank into a little coffee-colored pool. A fallen balsam spanned the brook, while beyond was an open, grassy point, with a background of tall, fragrant tamarack, pine and balsam trees, whose sweet, spicy odors mingled strongly with other wood aromas.

Under the former's overhanging stub was a dark secluded hole. Into this, after repeated efforts to disentangle from grasping bushes, Fred dropped his hook.

"There's some in here, sure enough," he said, with an accompanied muttered exclamation of tried patience as an unseen twig caught the hook, which came up after a good deal of pulling and disturbance to the pool, minus the worm. "Well, here goes again," as another fresh bait was lowered carefully in. Before it had disappeared from sight the birch rod bent, the line grew taut, and Fred triumphantly swung out a glistening trout, whose olive mottled back and crimson spotted sides gladdened our hearts.

"He's a beauty," I exclaimed, cutting a twig with a crotch to string him on, for we had no creel. "Try there again; you may get another."

At the third or fourth attempt two more fish were landed and added to the first. Further along, we came on a number of shallow pools with shadowy retreats under the banks, but all the trout inhabiting them were too small or the ground was so wet and full of treacherous "rooty" holes that we were prevented from approaching the stream. However, we kept on, looking for another likely spot, listening to the calls of a flock of bluejays and the occasional rapping of a big pileated woodpecker on a hollow, resonant pine stump.

Hearing the harsh cries of the former, reminded me of an incident that occurred some years back, when I was fishing with the Veteran on this same stream, only further down along its course, where a great many heavy, yielding pools existed, while the woods were especially wild and primeval. We were fishing a big pool, the Veteran ahead and I behind, walking along through the thick alder bushes that, as usual, bordered the bank, dropping in where an opening offered a favorable place to land the bright, voracious trout.

All at once a sound broke the stillness; a wild, weird cry, that to my imaginative and youthful senses was almost hair-raising in its uncanny nature. "What's that?" I asked, clutching the Veteran's coat. He stopped and listened. "Sounds like a fox," was the answer, as again the long-drawn, high-keyed wail came to our ears. As at that time I was unacquainted with the strange vocal powers of these crafty wood denizens, I became fully convinced it was nothing more or less than a hungry panther, and was consequently seized with terror. Every moment I expected to see a creeping, yellow form and round, gleaming eyes coming up behind us, so as a result of these dilated fancies, I trod on the Veteran's heels at every step, and ran into him when he stopped to fish, in effort to keep as close as possible, for my eyes continually sought the rear. Finally he was forced to leave off fishing in order to save his heels from being unmercifully trampled upon, and of course he could take no comfort with me clinging fearfully to his coat half the time. Will I ever hear the last of that episode? To this day it is referred to with laughter and imitations for my special benefit; illustrations of how I endeavored not to lose sight of the Veteran. Since then I have heard, many times, the shrill, yelping howls, barks and wails of foxes far off in the dark, quiet woods at night, and also when in them during the day; but their first influence has been replaced by a delightful pleasure, now experienced when listening to those wild forest sounds, unmarred, in their native element.

The stream was too swift to fish where it curved around the grassy point, with the background of thick conifers, still occupied by the chattering, brilliant jays; so we pushed on for a short distance until we discovered another pool, not very large, to be true, but favorable in its appearance.

While Fred put on a new bait and made a cautious approach within fishing distance, I continued on, walking through the scented grass and brakes to look for the next best location. Several times I came on fresh "deer beds" that evidently had been in recent use, for the grass was flattened into round semi-circular mats, and appeared snug, inviting resting places for some graceful doe or thick-set watchful old buck, who usually picks out the safest and most comfortable retreat. Surely the deer deserve all these small comforts, when one thinks of the hard, bitter winters some of them contrive to live through, followed by the summer torments of flies and ending with the hunting season. Here, however, I should stop, for yearly I am fortunate in enjoying that splendid sport, whose various pleasures, added to the bagging of a fine deer, are unlimited.

"This makes the sixth," said Fred, as I came back to where he stood displaying a plump trout he had just landed from the pool. Two or three undersized ones were swung out after this from the same place, but were of course immediately returned again, and as hooking these little chaps did them no good, the angler wisely concluded to move on. From under a partly sunken log near the bank he succeeded in catching a couple more, lively and well conditioned, that readily seized the bait as it drifted by their concealed nook.

A little below, another fish ran out into the open sunlight, swallowed the worm, and was promptly precipitated into the air, to join his former companions that were fastened on the birch twig.

"It must be getting toward dinner time; so I'll go back and take these trout with me," I said, picking up the fish.

"Very well; I'm going to stay for a while longer, and perhaps I can get a few more," he returned. So, after giving his catch a dip in the water to freshen them, I struck back from the stream into the woods, where the walking was better, and soon reached the path that led to our camp. How delicious are the various odors that penetrate one's nostrils, for, besides their fragrance, the resinous smells of spruce, balsam, tamarack and

pine are like a bracing, aromatic tonic when breathed into the lungs. Undoubtedly the wonderful health-giving purity and exhilaration of Adirondack air is due to the quantity of oxygen generated by the vegetable growth that gives rise to the healing vitality and life of the atmosphere.

Half way on the trail to camp there came to my ears a yell, or, rather, a call—the first describes it best—that made me jump before I realized it was only Rob announcing the near approach of dinner; so I hurried on, and a couple of minutes later deposited the morning's catch on the cook table beside the fire.

"The 'murphies' are all ready," said Rob, handing me the frying-pan filled with round, white slices of potatoes and a big lump of pork. "Smoke is mighty strong, so you'd better let me cook 'em," he continued; but I refused, for I always enjoyed a taste of outdoor cooking, despite the smarting, eye-watering process one is compelled to undergo. While the trout were being prepared by skilled fingers, I dodged around the fire, trying to escape the pungent smoke, and twice nearly upsetting potatoes and all into the dirt.

"Tough on yer eyes, isn't it?" asked Rob, as he set the steaming coffee pot and a plate of crisp toast on the table. "Now, we're all ready, I guess; come, get ter eatin' while things are red hot, and I'll have those trout fried before you can turn 'round."

Fred put in a timely appearance at this moment with five more fish, making a total of fourteen for his morning's catch.

Soon we were all seated, the flickering sunlight falling across the table, and Rob's culinary handicraft set before us. Did we enjoy and relish that meal, flavored with a pungent delicious taste of outdoor cooking, eaten with sound healthful appetites and the murmur of the brook in our ears? It is a question to be answered by those who have experienced these same pleasures and blessings the woods offer us.

After dinner was over and the wood artist had seated herself to put the finishing touches to the painting of the stream while Fred and the little lady enjoyed the springy, fragrant luxury of the open camp, I sat by the fire toasting my damp shoes, leaning back to look up at a mighty pine shooting high in soft lines against the sky. What a massive, wonderful structure, coated with rugged bark, the heavy, twisted branches reaching out like powerful arms to feel and vibrate with winds and storms; to wave and shake dark, feathery tassels in the breeze until they sigh and murmur to those who listen.

Two hours later we were driving homeward, the mellow light of the setting sun shedding a soft glow down the road and piercing the woods with hazy, slanting sunbeamed rays. At every "thank you ma'am" going up the hills, patient Flora would turn reproachful glances on the wagonload, and once as she stopped to rest, a big red doe, followed by a spotted fawn, crossed the road with a leaping bound, and two white flags waved defiantly as they disappeared. When we came to the place where they had entered the woods, there they both stood but a short distance away in a sloping green hollow. The old doe was browsing, and after one inquiring look at the familiar apparition of a horse and wagon, went on feeding unconcernedly, switching flies with her tail, while the fawn gazed intently in our direction until we finally drove on, leaving them still there.

That night as I stood looking out an open window on the quiet dark-shadowed lake, and the darker outlines of the surrounding hills and mountains, the sweet, mellow tones of an accordion floated across the water, and as the last note of a familiar air died away, the weird, lonely hooting of an owl came clearly from the silent shore—a good-night and pleasant dreams from a wilderness voice.

CAMILLA.

### Tough and Tender.

*Editor Forest and Stream:*

I have read in your issue of April 2 the very pertinent editorial comments upon the experiences of the Hubbard (Outing) party in Labrador, and the death of Mr. Hubbard by starvation in October. These deprecate the thoughtless undertakings of inexperienced and unequipped explorers in a wilderness country. October was not a month to starve in. By way of contrast between the taught and untaught I beg to refer your readers to the sketch of Dr. Robert Bell, which was printed by the FOREST AND STREAM in the fall of 1900, entitled, "One of Canada's Explorers," and more particularly to the exploit of Factor McLean, of the Hudson Bay Company, who is on record as having made the trip from Northwest River in Labrador to Winnipeg on snowshoes, and living off the country—a distance of 2,500 miles, requiring fourteen weeks' time. Such a feat is marvelous, and beyond comprehension. McLean had but a single attendant, both carrying a kit and sleeping bags, and subsisting for the most part upon what they trapped and shot.

Sportsmen who make short trips into the woods with well-equipped and experienced guides have small conception of the woodcraft necessary to accomplish an itinerary like that recorded of Dr. Bell.

When I first heard of Leonidas Hubbard's death I would not credit the report; for I had been a good deal on Hudson Bay trails, and traveled with the brigades several times (in mid-summer), and learned their systematic ways; and I felt that if the Hubbard party had outfitted at Northwest River station, which I have visited personally, he would have been set straight and given a proper send-off. The temerity, not to say innocence, of the unsophisticated is surely marvelous to contemplate. How often I have asserted in my writings that not a considerable fraction of those who write knowingly of sport in the woods could take care of themselves a week if left to their own resources. They would get lost in a ten-acre wood lot. Even the Nordenskiöld arctic exploring party perished of starvation in their tents on the Lena River in Siberia because they did not think to try for the fish which were beneath them, or know how to catch them if they did.

## Natural History.

### Colorado Buffalo.

DENVER, Col., March 30.—*Editor Forest and Stream:* In your editorial under "Colorado's Last Buffalo" in your issue of March 26, you refer to a press despatch of March 20, announcing the killing in Colorado of the last of the Lost Park herd of buffalo, and you apparently locate the Lost Park in the northwest part of Colorado, whereas the Lost Park in which these buffalo were is in central Colorado in Chaffee county.

I did not see the press despatch to which you refer, and doubt somewhat the truth of its statement, for the reason that from the best information I have, some persons residing in Buena Vista, Colorado, killed two bulls, one cow and one calf, in February, 1897, which were understood to be the last of the Lost Park herd. This killing was done to procure specimens, the skeletons and hides only being saved, the meat having been left in the field.

It may be a matter of interest to you to know how this work of vandalism could be accomplished and go unpunished, as has been the case thus far. It appears that the killing was done very quietly and the hides and skeletons were kept concealed, so that the game commissioner could find no sufficient evidence of the act or identification of the perpetrators until 1901. In that year, by some very skillful detective work, he and one of his deputies were introduced to the perpetrators as taxidermists desiring to purchase the hides and skeletons, and criminal informations were filed against the two Bartletts and some other parties who assisted them in the killing.

There were two different trials of the perpetrators, in which the evidence was absolutely conclusive of their guilt, but in the first case the court held that the prosecution was under the game law of 1893, and that it had been repealed by subsequent laws. In the second case, the court instructed the jury that if the evidence showed the defendants to have been in possession of the hides and skeletons more than three years prior to the commencement of the prosecution they must be found "not guilty." The evidence did so show; the jury returned the verdict of "not guilty," and the defendants were discharged.

Upon being discharged the defendants asked an order for the return of the hides and skeletons, which the court refused to grant, but ordered the sheriff to retain their custody until further order of the court. Soon thereafter the State Game Commissioner commenced a replevin suit for the hides and skeletons. This suit hung fire for some time, and for reasons of which I am not fully advised, the case was dismissed.

On October 24, 1903, the perpetrators of the act began a replevin suit against the sheriff in whose custody the property was, and that suit is now pending in the District Court of Lake county, and at the request of the present game commissioner, I have promised to look after it and try to see that the perpetrators of the outrage, although they have so far escaped punishment, shall not be able to get away with the proceeds of the crime. Notwithstanding the complications above recited I anticipate no serious difficulty in preventing the undesirable result which I have indicated.

### Bears as Game Destroyers.

*Editor Forest and Stream:*

I have been interested in the discussion the past few weeks concerning bears as game destroyers. In March 24 issue Wm. J. Long expresses the hope that readers will send in their "observations" along this line. When disputed questions like this arise, we find much of the discussion consists of only an expression of sentiment and opinion, rather than that of actual personal observation. I have referred on previous occasions to the most unaccountable way in which different persons of equal experience and intelligence, and in the same locality, will arrive at conclusions so widely different as to admit of no compromise; and yet when it comes to an analysis of their actual observations they may be very similar; thus we must conclude that a prevailing sentiment does sometimes influence persons in arriving at conclusions as a result of observation.

For instance; my sentiments are strongly in favor of the bear: of not only prohibiting a bounty on him, but protecting him, if necessary for his existence. My sentiments are, that of all our North American animals the bear is the most interesting, and the most to be desired from the standpoint of the hunter, either in the sport connected with his capture or the trophy which he furnishes; and I would go further and pay more to hunt where there were plenty of bear, with even a possibility of killing one, than for a double certainty of killing any other game where no bear were to be found. Those are my sentiments.

My opinion, based on observation, is that they are not game destroyers, and it is quite possible that my opinion may, to some extent, be the result of sentiment. That they are "bad medicine" on hogs and sheep almost anyone will admit, but that is not the question at issue. Perhaps being unduly influenced by sentiment, when I have found the remains of a young game animal which has been eaten by bears, unless I can find evidences to the contrary, I conclude at once that it has died from some natural cause, and after decomposition began a bear had found it, owing to the stench, which will attract a bear from a long distance; for they eat carrion as readily as freshly killed meat.

A person who has only a feeling of hostility for the bear, and believes him to be a destroyer of game, would on the same occasion report that he had found where a bear had killed and eaten the young of some animal; of course believing it to be a fact. The observations being the same, conclusions are largely the result of sentiment.

I have found where bear were feeding on the carcasses of elk, and, in nearly every instance, have learned through investigation that the elk, or presumably the same ones, had been wounded by hunters and escaped; probably being found by the bears only after the stench from the

decaying carcass enabled them to locate it at some considerable distance. I was once walking through the woods, when I suddenly came upon a black bear, not over 25 yds. away; it was standing looking at me, and I shot it in the head. On going to it, I found it had been to dinner and had just finished burying the remains of a deer, on which it had been feeding; and as it had been busy at its work it had not noticed my approach. A few days later I learned that a hunter had wounded a deer, which had escaped from him in that exact locality, about two weeks before, indicating that it had been found by the bear only after the carcass had begun to decay.

In all the bears which I have followed, I have never seen any actions or signs to indicate that they were looking for game: always prying into such places as would be a likely harbor for insects or mice, or where honey, roots or berries of any kind might be found. In fact if one who had never heard of such an animal, and knowing nothing whatever of their habits, if such were possible, were to go into the woods where bears live, and make a study of them, his impression would be that they were vegetarians, as there is so little in their actions when hunting for food to denote a beast of prey.

Mr. Long says, in speaking of the Yellowstone park: "Mr. C. J. Jones, game warden of the park, says positively that bears are not molested there simply because they do no harm to the game. \* \* \* yet one man's experience counts for just one man's experience and no more in settling any question of animal habits." Now I would like to take exception to this last statement: If it was a matter of casting votes, where each counted the same, that would be correct; but when it comes to determining the habits of animal life in North America, the verdict of Col. Jones should count equal to that of a half dozen average readers of FOREST AND STREAM; for the number of men living to-day who have had an equal experience, in an equal extent of territory, of equal intelligence, and who have observed and studied wild animals to the same extent and thoroughness as has Mr. Jones, are very, very few.

At one time a disease broke out in our town which was declared by some of our local medical men to be small-

pox, while others insisted it was not. In order to arrive at a correct conclusion, an expert of the medical profession who was the most experienced, and highest authority obtainable, was sent for to come and decide the case in dispute.

Most of us who are interested in wild animals are but amateurs, while Col. Jones may be compared to a professional, and his conclusions should have corresponding weight. The "observations" of all should count for the same, as far as they go, regardless of the experience of the observer, but the weight of conclusions must depend upon the extent of experience. All respect and consideration are due to those who take the other side, for some there be among them who are of long experience, and whose conclusions are not to be ignored.

EMERSON CARNEY.

MORGANTOWN, W. Va.

In our issue of March 19, Mr. Manly Hardy gave an account of a moose, which, as the circumstances indicated, had been killed by a bear. Mr. Hardy writes: "By a misprint I was made to say that there was a 'light sun.' I wrote 'light snow.' Mr. Staples, who found the moose, told me he could see every motion, just how the bear had crept up to the moose, which was lying down, how he had jumped on its neck and held it down, and how they struggled over a large place; but the moose never was able to get on its feet. The bear was a small one, while the moose was a large one, with nine points on each horn. I know of another case where a moose, after the entrails were removed, was turned over on its breast to let the blood out and was left over night. In the night a bear crept up to within springing distance, evidently thinking the moose was not dead, and sprang on it and clawed it; but finding it was dead left without eating any."

NEW YORK, April 2.—*Editor Forest and Stream:* The new question which has just come up as to the destruction of game by bears is of very great interest, less from the practical side of game preservation than from the natural history side.

I know nothing whatever of the black bear of the East,

and very little about the bears of any region. On one occasion, however, I followed a band of elk for a long time through the snow over the mountains. I had hoped to come up with them, but for the last mile or two of my travel a medium sized grizzly bear had cut in ahead of me and was following the elk trail. This alone proves nothing. The bear might have had a dozen motives for doing what he did.

On the other hand, if we may trust the stories told by the plains Indians of buffalo days, bears sometimes attacked and killed buffalo and also elk. I have cited a case, on the testimony of an eye witness, where a grizzly bear tried to kill a buffalo and was subsequently—after a long fight—himself killed by a young bull that was with the heifer.

Indian stories of fact and myth frequently speak of bears killing buffalo, and tell how the bears crept around in the brush of river bottoms to get near enough to spring on the buffalo. An old Blackfoot friend, now dead, told me of seeing a grizzly bear kill an elk, and I remember his saying "he bit it in the jaw," implying, of course, that the bear grasped the elk's neck with his arms and crushed the head with his jaws.

While the food of the bear is exceedingly varied, we all recognize that they eat flesh when they can get it, and I believe that they will return day after day for weeks to a carcass, until nothing remains of it except the larger bones, which they still seem to like to mumble or play with.

Personally, I have absolute confidence in what Mr. Manly Hardy says of the eastern black bear of his region, for Mr. Hardy's experience goes back further than that of most of us, and he is a most careful observer.

G. B. G.

### The Linnaean Society.

A REGULAR meeting of the Society will be held at the American Museum of Natural History, 77th Street and Eighth Avenue, New York, April 12, at 8 P. M. The speakers will be: L. B. Bishop, "Further Notes on the Winter Birds of Pea Island, N. C."; Wm. Dutcher, "The Work of the National Committee on Bird Protection."

### Alaska Game Law.

A HEARING was had last week before the Committee on Territories of the United States Senate on Mr. Dillingham's Senate bill 4,166, which repeals the game laws of Alaska, and which, if passed, will, it is believed, result in the speedy extinction of large game in Alaska, and the consequent starvation and death of large numbers of the natives.

It is a curious thing that the persons who are reported to chiefly advocate this bill, advance as their principal reason for its advocacy, their wish to benefit the natives, and do not appear to realize that wholesale permission to slaughter at all seasons of the year for commercial and other purposes, while it may help the natives for a year, or possibly two years, will then have placed them in greater straits than ever.

One of the chief advocates of this repealing bill is reported to be a gentleman very familiar with matters in southeastern Alaska, and with the facts as to the deer there, but not familiar with conditions in the farther north, principally affected by the game law.

Among the letters received by the committee we print two—one signed by the president of the Boone and Crockett Club, addressed to Senator Dillingham, and another from Mr. Andrew J. Stone, addressed to Mr. Madison Grant, Secretary of the N. Y. Zoological Society. Mr. J. Alden Loring, of Owego, N. Y., also wrote Mr. Grant a letter similar in tenor to the one printed in FOREST AND STREAM last week.

We give the letters below:

BOONE AND CROCKETT CLUB,  
Secretary's Office, 11 Wall Street.

NEW YORK, March 23, 1904.

Hon. W. P. Dillingham, Senate Chamber, Washington, D. C.:

Dear Sir—At a recent meeting of the Boone and Crockett Club resolutions were passed putting the Club on record as opposing Senate Bill No. 4,166, for the reasons stated in this letter. A copy of the Club book is enclosed to show the personnel and purposes of the organization.

A letter just handed us by Mr. C. Grant La Farge, in which you set forth in great detail your views on the subject, would indicate that you place much reliance on the information furnished you by the gentlemen mentioned therein.

We would say in reply to this, that the Boone and Crockett Club is not composed of gentlemen who have purely theoretical or academic views, but its members have a very considerable amount of practical information on the subject.

Many members of the Club, notably Dr. C. Hart Merriam, Mr. Walter B. Devereux and Dr. Lewis R. Morris, are familiar with the condition of affairs in Alaska from a study on the spot. Other members, like

Mr. Jas. H. Kidder and Dr. Lord Smith have hunted there season after season.

In addition to this, members of the Club have supported the Andrew J. Stone expedition, and are thoroughly familiar with its results. Mr. Stone probably knows more than any living man about the animals of Alaska, having traversed something over one thousand miles of the Canadian arctic coast, having crossed from the Mackenzie to the Yukon Rivers, and having hunted for us during the last three years along the south coast of Alaska from the Alaska peninsula to the Stickene River, B. C., and in the interior.

Mr. J. Alden Loring was also sent, under the direction of some members of the Club, to the head waters of Cook Inlet three years ago; a letter from him bearing on the subject is enclosed.

Our authority on the question of the walrus and sea lion is Mr. Charles H. Townsend, who was for many years in the U. S. Fish Commission, and who is an international authority on the fur seals of Bering Sea, as well as on the sea lions and walrus.

In addition to this we have many sources of information, such as Mr. Phelps, as appears in the letters to which you refer, so that the views we express are not without some basis.

We may say to start with that all the above authorities are in absolute accord and against the proposed repeal.

As to the invasion of the immemorial right of the natives to trap, the report of the sub-committee of the Committee on Territories is erroneous, as there is no limitation in the existing law on the killing of any fur-bearing animal, except bear, which latter can be killed during the spring, when their fur is at its best. There is also in the law no limitation as to the killing of animals for food by natives, explorers, miners or travelers, the purpose of the law being to preserve for the residents of Alaska, both native and white, the present store of food animals, and to prevent a few professional hunters from destroying them en masse for commercial purposes.

There is no surer way to destroy the game, and to prevent anyone from having fresh meat, than to allow the employment of paid hunters to supply meat to steamboats, mining camps and settlements.

Senate Bill No. 4,166 seems to be based on an erroneous view of the needs of the natives, and on the mistaken idea that they are dependent on meat for food. As a matter of fact the coast natives are fish eaters rather than meat eaters.

The natives, when demoralized by the presence of whites, and when equipped with modern firearms, are not only reckless and improvident killers of game, but are frequently used as agents for white hunters who wish to evade the law.

The present limitations on the killing of animals are

absolutely necessary in the interests of the natives themselves, as the walrus has been greatly reduced in numbers along the Alaskan peninsula, and the sea lion must be protected if it is to be preserved much longer.

As to the alleged numbers of brown bear, we cannot help but feel that you have been misinformed both as to its numbers and ferocity.

On the Alaskan peninsula and on Kadiak Island the brown bears have been reduced to a small fraction of their former numbers. These bears are fish and vegetable rather than meat eaters. The writers have been concerned in several expeditions for these bear during the last two or three years.

As to the caribou on the Alaska and Kenai peninsulas they are on the verge of extinction. In the latter district their numbers in 1902 had been reduced to less than forty. There are no elk in Alaska.

The necessity of protecting animals during their breeding season, the protection of breeding females, the limitation of the numbers to be killed by one person, and the absolute prohibition of commerce in hides, meat and antlers, are fundamental principles.

Every State in the Union, every province in Canada, in fact, every civilized community on earth, including the newly organized protectorates in Africa, especially Uganda, has found it necessary to apply these principles and restrict the indiscriminate killing of wild animals, both by whites and by natives, in consequence of the universal introduction of modern firearms, especially repeating and long-range rifles.

Until two years ago Alaska alone was without such protection, and the wasteful slaughter of game there was without check. An exceedingly liberal law was passed in 1902. This law it is now proposed to repeal, and to leave without protection all birds, all sheep, goats, walrus, and sea lions, and impose a nominal restriction on the export only of hides and heads of the three species of deer.

A license is imposed of twenty-five dollars for residents, and one ten times as large for non-residents. Under this dealers can ship two moose and two caribou heads worth \$150 to \$200 apiece for each \$25 license taken out in the name of some resident.

It is scarcely credible that the Senate of the United States, having before it the destruction of the buffalo, and other large mammals in the west, which to-day is a standing reproach to the civilization of our country, would deliberately remove from the statute books all protection for the game animals in the one locality where they still exist in anything like their former numbers. Those who are not familiar with the details of the destruction of the buffalo, as well as the elk, sheep and deer in North America, cannot realize how quickly such destruction can take place. In the years 1880 and 1881 the buffalo north of the Union Pacific Railroad were estimated at 500,000. Less than five years afterward,

in 1886, only 400 of this herd remained. It is undoubtedly a fact that a similar catastrophe awaits the animals of Alaska, if, from any misapprehension of the facts, the true interests of the natives are disregarded, and the game animals slaughtered without restriction.

In closing, we wish to thank you for your courtesy in addressing us through Mr. La Farge, and to say that we thoroughly appreciate the generous instinct which prompted you to intervene on behalf of the native Alaskans, and we do not wish you to suppose that we are actuated by any sentimental regards for game as such, but we honestly believe that the maintenance of the present law is for the true and permanent interest of the natives.

Very respectfully,

(Signed) W. AUSTIN WADSWORTH.

(Signed) MADISON GRANT, President.  
Secretary.

HOTEL BELLECLAIRE, New York, March 11.  
Mr. Madison Grant, Secretary of the New York Zoological Society, 11 Wall Street, New York City:

My Dear Mr. Grant—In answer to your inquiries in reference to the killing of game in Alaska and especially that part of the killing in which the native element takes a part, I can only cite some of the things that have come under my personal observation.

In considering the native element in connection with the killing of game, we must divide them into two classes, the coast people and the inland people.

The inland people are practically out of the question when considering laws for the protection of game, for the reason that there are but few places where the law could reach them. The largest white population and the largest native population is on or near the coast, and, unfortunately, in a country characterized with so much coast line as Alaska, a very considerable of the animal life is in reach of the coast. Especially is this true of south-eastern Alaska and western Alaska.

The deer are the principal game of south-eastern Alaska, and while there is one condition there that favors their perpetuation indefinitely, there are others that help very extensively toward their extermination.

The first instance is in the character of the country that furnishes them everywhere during most seasons with the best of cover—but in the second, we might safely say that ninety per cent. of the country inhabited by the deer in south-eastern Alaska slopes from the rugged mountain ridges toward the sea. When the snows begin to pile up in the fall of the year the deer travel toward the lower levels and the sea, and the result is that eventually seventy-five per cent. of them, if not more, are in the neighborhood of the coast and an easy prey to every class of hunter. At such time of year, when there was no law to protect these animals, the natives slaughtered them by the thousands, merely for the skins, which usually sold anywhere from fifteen to thirty-five cents each. It is safe to say that not more than ten per cent. of the flesh of these animals taken at such times was consumed. The coast natives are a fish eating people—their favorite food is abundant and more easily procured than the flesh of animals, and for that reason they do not depend on the deer for food, but if left to their own inclinations, would slaughter it for the most insignificant profit. A thing again that is not necessary to their support, for their support comes almost solely through the capture of furs and as laborers at the salmon fisheries.

The trade in deer skins in south-eastern Alaska grew to enormous proportions in the last ten years, and if allowed to continue in the same way for another ten years would very nearly exterminate the deer.

We must not forget that an Indian would rather hunt all day for a deer skin that would bring him twenty cents than to do ordinary labor for one dollar and fifty cents, and in this particular character becomes a greater enemy to the life of the game than the average white man.

This I am confident of—there is not one-half the number of deer in Alaska to-day that there were ten years ago.

Another feature that has to do with the preservation of game animals in Alaska is that of the settlements, mostly mining. It is of no avail to prohibit white men from killing game for the market and to permit natives to kill what they like, when they like, for they not only take advantage of this to market great quantities of game, but white men take advantage of such a law by putting themselves behind the natives, and in this way speculate through the slaughter of game.

During a visit to Hattie Camp, thirty miles west of Fort Wrangel in the fall of 1902, I found that the people developing the mines there were using about ten deer a week, and they told me that that was about the average the year through. These people, as well as the people of all other mining camps in south-eastern Alaska, could get beef on short notice from Seattle, but they used the deer because it was cheaper.

Scatter mining camps and settlements of this nature all through a country as they are now scattered throughout the coast country of Alaska and give them liberties in the consumption of game and they will soon destroy it, and the native, if allowed, will prove an important element in its destruction, for the reason that he prefers to hunt rather than do ordinary labor, even though his pay is very much less. While in western Alaska last summer, a Mr. Peter Larsen, of Unga, told me that the fall before he and his Indian brother-in-law killed caribou until they had secured thirty fine heads, which they took to San Francisco and sold at a good profit. My experience teaches that the securing of these thirty marketable heads meant the killing of not less than one hundred animals, and the Indian brother-in-law was the screen behind which this scene was enacted.

The natives and the white men married to natives and who, when pressed, can use the natives as a screen, supply the Appolla mines at Unga with caribou meat the year round, and will continue to do so as long as any special permit is granted the natives. The present law does not permit of white men going to sea for the purpose of hunting sea otter, that are now very nearly extinct, but the native is allowed to hunt and the white man manages to use him and get the profit.

The natives of Bellkofsky kill caribou the year round and ship them to Unalaska to market.

Natives on the Bering Sea coast of the Alaska peninsula kill caribou by the hundreds, merely for the hides, which they sell to the traders for a most insignificant consideration.

In the summer of 1902 one native killed near Chugathik bay, Cook Inlet, about twenty-five head of moose for the purpose of selling the meat to the Aurora Mining Co., and a very unfortunate feature of this killing was that the lazy Indian would not usually bring out more than a quarter or a half of an animal when killed, for the reason that to bring out a whole animal is rather more work than a native cares to perform at one time.

During the summer of 1903 several placer mines, operating with from forty to sixty men each, at the head of Cook Inlet, were supplied largely with moose meat taken by the native hunters, and the steamer Tynonic, that plied Cook Inlet, fed its crew and passengers all summer very largely on moose meat supplied by natives. If the natives of Alaska were dependent upon the game for food it would be heartless to deprive them of it, but it is a positive fact that the coast natives do not, and any legislation in their behalf as concerns the killing of game at once becomes a legislation in behalf of the sorriest lot of white wretches that inhabit that country, and means eventually the extermination of the game, and that, too, almost before people generally realize what is taking place. There were ten caribou on the Alaska peninsula fifteen years ago to every one that can be found there to-day. Less than ten years ago hunters would take not

THE QUAIL YARDS AT PINEHURST.

less than two hundred skins of the big brown or Merriam's bears in one spring on Muller bay with but little effort. Ten skins is a big production to-day.

Ten years ago a single hunter would take in a short spring's hunt on Stephana Flats on the Alaska peninsula, north of the Shumagin group of islands, forty or fifty skins of the Merriam's bears, and there are not enough bears there to-day to entice even a single hunter who would be satisfied with a couple of skins.

I have mingled with almost every element known to that north country in almost every section, and I know of few places where the protection of animal life has not now become one of serious importance. But the animal life of that country cannot be protected as long as the natives are given special liberties.

Very sincerely,

(Signed) ANDREW J. STONE.

## Quail Stocking in North Carolina.

THE writer spent a day or two at Pinehurst, largely with a view to seeing the hunting facilities at that noted resort, and found some very interesting things going on. There are 6,000 acres in the estate, and 30,000 acres outside are under lease by Mr. Tufts, the sole owner of Pinehurst. For some of these leased lands, used as a preserve, the owners are paying a fixed rental, while in other cases the taxes are paid. Partridges (quail) are the principal game. The country is very open, the large timber being the long-leaf pine, which in most cases has been devoured by the forest fires, a great curse in that section. The country is very rolling, at the foot of every sand hill being a thicket of bay and gallberry bushes, through which little streams, very clear, run all the year. Partridges have never been very abundant in that country, as there is not food enough for them; but to remedy this, cornfield peas are being planted by the Pinehurst people. Cattle and hogs run at large, hence the pea patches have to be fenced with wire. At the poultry yard at Pinehurst a very singular sight was seen, this being 2,000 partridges in wire-screened divisions of the poultry yards. On top of these divisions is a great canopy of white cloth, so that if the birds become frightened and fly they will not injure themselves, the meshes of the wire netting at the sides being very fine and not injurious to them. A photograph, which was very artfully taken, accompanies this article and shows the ground under the screens literally covered with partridges. While some of these were caught in this State, the greater number came from Kansas. The Kansas birds are darker than those from North Carolina, but those from both States are of about the same size. The birds are now being

released. In one section a little hole is made through which the birds can leave one by one and go where they like. In other cases the birds are taken, a dozen or so at a time, out to the leased lands and there turned loose.

Yet another experiment is being made on the poultry farm, where sections have been arranged, screened at the sides and top with fine wire, water running through each section and in each a breeding house being provided, as well as screens for the further shelter of the birds. Half of this place is devoted to Mongolian pheasants and the other half to partridges. George C. Chase, the poulterer, appears to be very confident that he will succeed in rearing both pheasants and partridges in this way. The pheasants are to be used quite largely in stocking both the Pinehurst estate and the leased lands. If Mr. Tufts can get 50,000 acres around his estate in a block then this raising of pheasants will be a great success, no doubt, as the country seems to be pretty well suited to them. But the land is now held "en bloc," as there are here and there among his leased properties lands which the owners refuse to allow to pass from their control. This is rather awkward, but perhaps may be overcome. However, Mr. Tufts is going to try the pheasant-raising anyhow, and the experiment on so large a scale in North Carolina will be watched with interest. This is the first season that hunting has gone on regularly at Pinehurst, and considering the open country and the relative scarcity of the birds, the bags

have been fair, though, of course, not half what they are in the sections of the State where small grain and peas are grown so largely. There isn't any question that the cow pea is the very best food for partridges—makes bigger birds and fatter ones, and carries them through all sorts of weather, since it takes a very deep snow to cover two-thirds of the pea vines, and even then with a little scratching there is the grain ready for use by the partridge (as every North Carolinian knows him).

FRED A. OLDS.

## New York Spring Duck Shooting

THE hearing given by the New York Senate Committee on Fish, Forests and Game on the subject of the Hubbs bill was held March 23 in the Senate Chamber at Albany.

The opposing factions were not so evenly divided as at the hearing one year ago, which preceded the passage of the bill abolishing spring shooting. The Senator and three Assemblymen from Long Island, Mr. W. K. Post, and one or two Long Islanders commercially interested in the practice of spring duck shooting, represented those in favor of the bill, while among those who opposed there was a large delegation from New York city as well as from the central and western portions of the State. Eight or ten important game protective clubs sent delegations to the meeting, Mr. W. T. Hornaday, Director of the New York Zoological Park, represented the New York Zoological Society, and the Boone and Crockett Club; Mr. Wm. Dutcher represented the American Ornithologists' Union, the Linnæan and the Audubon Societies; Dr. T. S. Palmer, of the Biological Survey of Washington, and Mr. Robert B. Lawrence, formerly President of the New York Fish, Forest and Game League, were present.

Mr. Hornaday made the opening address in favor of the existing laws, and was followed by Mr. Dutcher. An excellent speech was made by Mr. Robert B. Lawrence and Dr. Palmer closed the argument, illustrating his remarks by a number of tables and diagrams. These showed, among other things, that in the Chesapeake Bay and in North Carolina, where wildfowl are thought to be very plenty, and where it is claimed they may be shot during a long open season that, taking out the "rest days" during that season, when shooting is not permitted, those States have in one case ten days, and in one nine days less shooting than the existing law gives in New York. The repeal of the existing law would give New York more than double the number of shooting days had in Maryland or North Carolina.

The hearing lasted for over three hours and there was an opportunity for everyone to speak his mind. What action the committee will take is of course not known, but those who listened to the arguments on both sides

have strong hope that the bill will not be reported by the committee.

BROOKLYN, N. Y., March 25.—*Editor Forest and Stream:* Your editorial in the issue of Feb. 27 in regard to spring shooting and your eulogy of Mr. Brown occasioned some thoughts in my mind, and I would like to unburden myself of the same.

Did Mr. Brown ever go to the root of the matter, "the sale of game"? There is the trouble. It is not the spring shooter, like myself, who breaks his chain for two or three days in the spring that is reducing the supply of ducks, but the market hunter and cold storage.

Let Mr. Brown go to the root of the matter and get up a bill stopping the sale of game, and he will no doubt find the nut a hard one to crack.

Where were the opponents of the Hubbs bill a few years ago, when a market hunter managed to get a bill passed allowing battery shooting between Smith's Point and Quogue, Great South Bay, Long Island? According to R. B. Roosevelt, "the battery is the coffin of the duck," and it is especially so in that locality, the bay being so narrow. A few "spring shooters" (not market shooters) got together and had the bill repealed the following year.

During the first freeze-up of the bay last winter, two market shooters of Long Island killed nearly 300 ducks in two days, and you can rest assured that those 300 ducks came to the New York markets.

Stopping spring shooting will only be successful in a very small measure in increasing the supply of ducks. Let Mr. Brown bend his energy and knowledge to the suppression of the sale of game and he will be nearer a solution of the problem.

Mr. W. E. Hookway's suggestion "to limit the bag" would help to reduce the market supply.

According to newspaper reports Grover Cleveland has just been on a successful duck shooting trip. Lucky Grover! I wish I were as well fixed. I'd shoot some ducks, too.

C. HOWARD.

## The Kadiak Bear.

SEATTLE, Washington, March 27.—*Editor Forest and Stream:* Referring to your editorial on The Passing of the Kadiak Bear, I should like to say something about this species.

I spent parts of 1888 and '89 prospecting on Kadiak Island. Bears were very plentiful at that time, and there was more than one species. During the summer season I have known the bears to swim from Kadiak to Goose Islands, thence to Silchinak Islands, and thence to Tugidak, where I shot a three-year-old during the latter part of August, 1889. I have seen bears on the mainland of Alaska, opposite Kadiak Island, which I could not tell from the Kadiak bear, by seeing them on foot and being very close to them.

What is commonly called Kadiak bear has a broader skull than any other bear found in Alaska. The nose is also broader, the nostrils larger, the perpendicular crease between the nostrils deeper and more prominent, the skin on the nose is darker, and the dark skin extends deeper in the nostrils. This last feature you will not find in any other member of the brown bear family in Alaska.

I have seen bear tracks on Sutwick Island, which lies twelve miles from the mainland. I know two fishermen who wintered on "Nigai" Island, who killed a bear in the early spring of 1887. To reach that island a bear would have to swim a distance of over twelve miles.

Bears are attracted to outlying islands in the summer season by dead whales drifting ashore. In former years caribou existed in great numbers on the Alaska peninsula, and during the calving season swam off to all the islands west of the "Simedias," to escape the wolves. Natives have repeatedly told me that the bears followed the caribou in former years and preyed on the caribou calves. I have been on at least 25 islands—during the years 1886, '87, and '88—where the old caribou horns lay concealed in the dead grass so thick that it was difficult to walk through small patches on account of getting the feet tangled up with the horns.

The narrowest point on Shelikof Straits between Kadiak Island and the mainland is 25 miles. There is nothing improbable in the bear swimming either way, or having been carried either way on the ice. I do not believe the bears found on Kadiak Island are any larger than some specimens taken on the mainland. The largest bear skin I saw during my residence in Alaska was killed over 200 miles southwest of Kadiak on the Alaska peninsula in 1886, and the first time I go to San Francisco I believe I can get the dimensions of the skin.

THOS. W. HANMORE.

## A Vanishing Game Bird.

In the April number of the Auk Mr. Herbert Brown writes with much feeling of that rare little game bird *Colinus ridgwayi*, the masked Bob White. This bird, as many ornithologists will remember, was originally identified as *Ortyx graysoni*, a Mexican species, but was later described by Mr. Brewster as new, and was named in honor of Mr. Ridgway. Mr. Brown tells us that it is reported that in old times—say forty years ago—this bird was moderately abundant in a limited range in southern Arizona and northern Sonora, but the settling up of the country, the bringing in of a great number of cattle, and a number of rainless seasons have stripped the country of the masked quail bare of vegetation, and the birds are disappearing or—Mr. Brown fears—have already disappeared. "When their food and shelter had been trodden out of existence by thousands of hunger-dying stock, there was nothing left for poor little Bob White to do but go out with them. As the conditions in Sonora were similar to those in Arizona, birds and cattle suffered in common. The Arizona Bob White would have thrived well in an agricultural country, in brushy fence corners, tangled thickets and weed-covered fields, but such things were not to be had in their habitat. Unless a few can still be found on the upper Santa Cruz, we can, in truth, bid them a final good-bye."

## Haverhill Protective Association.

HAVERHILL, Mass., April 2.—*Editor Forest and Stream:* For some time several of our enthusiastic sportsmen have been talking of game and fish protection, enforcement of the game laws, and the good that might be accomplished by an association of the right kind, with the result that Thursday evening, March 31, they met at a prominent business office, and when they wended their way homeward The Haverhill Fish and Game Protective Association had been formed and officers elected: Mr. C. J. Halpen, President; Mr. Clifford Poor, Secretary; Mr. J. A. Wood, Vice-President; Mr. J. W. White, Treasurer; Messrs. C. J. Halpen, J. L. Adams, C. A. Abbott, C. D. Syrell and G. W. Beckell, Directors. The membership roll already carries forty-five names. The charter

list will remain open until May 1, when it is expected this number will be more than trebled. The association will be incorporated at once, and it will no doubt be a power in the good work of game protection.

The extreme cold and deep snow of the past winter has played sad havoc with our quail, and without doubt most of them have perished. Three years ago this spring the Haverhill Gun Club and their sportsmen friends procured thirty dozen quail from Kansas and liberated them within a few miles of our city. They did very nicely indeed. Their experiment proved a grand success; so much so that they again took up the burden, or rather the hat, and the shekels kept up a merry jingle until a goodly sum was raised, and several dozen quail have already been secured and turned loose, and several more dozen are expected.

We are gradually getting on to the FOREST AND STREAM Plank down here in the "Old Bay State," the sale of partridges and woodcock being prohibited at all times, so that it really looks as though the time was not far distant when we can hold the whole plank down.

POINTER MAN.

## Legislation at Albany.

ALBANY, April 2.—Governor Odell has signed Assemblyman G. H. Whitney's bill, 741—876, providing that perch shall not be taken from the waters of Saratoga county from Feb. 1 to May 1, both inclusive.

The Senate has passed the following bills: Senator Le Fevre's, 376—1041, relative to the close season for grouse, woodcock and quail in Dutchess, Orange and Ulster counties.

Senator Malby's bill, 718—980, relative to the proceeds of actions brought by the people for violations of the forest, fish and game laws.

Senate committee's bill, 668—1014, relative to the prevention of forest fires.

Senate committee's bill, 783—1013, Constitutional amendment allowing the Legislature to authorize the removal of dead timber on burned areas in the Adirondack region so far as is necessary for reforestation.

The Senate has advanced the following bills to third reading: Assemblyman Wolff's bill, 383—886, relative to fishing in Jamaica Bay.

Senator Malby's bill, 538—1049, relative to fishing in St. Lawrence county.

Senator Townsend's bill, 788—1030, providing for restocking the Adirondack region with wild deer and elk.

Assemblyman C. R. Matthews' bill, 687—807, relative to the close season for trout.

The Senate Committee on Forest, Fish and Game has reported the following bills:

Assemblyman Dickinson's bill, 160—883, relative to the close season for squirrels, etc., in Genesee and Cortland counties.

Assemblyman Cowan's bill, 518—1297, relative to the close season for pheasants. Advanced to third reading.

The Assembly has passed the following bills:

Assemblyman Robinson's bill, 1090—1416, prohibiting the placing of carp in Conesus and Hemlock lakes, Livingston county.

Assemblyman Denison's bill, 1100—1455, relative to taking wild-fowl in Black River Bay, Jefferson county.

Assemblyman Reeve's bill, 376—1537, relative to the possession of venison.

Senate Committee's bill, 630—800, defining the boundaries of the Adirondack Park.

Senator Barnes' bill, 410—987, prohibiting the sale of trout caught in Rensselaer county.

The Assembly has advanced to third reading the following bill: Assemblyman Cocks' bill, 1178—1594, relative to gray squirrels.

The Assembly Committee on Forest, Fish and Game has reported the following bills:

Senator Townsend's bill, 12—853, providing for the protection of wild black bear.

Senate committee's bill, 481—754, providing that no person shall take any wild deer between one-half hour after sunset and one-half hour before sunrise.

Senator Townsend's bill, 15—870, requiring residents of other States to secure licenses from the State Commission before being privileged to hunt deer in New York State.

Assemblyman F. C. Wood's bill, 1202—1618, relative to restocking the Adirondack region with elk.

Assemblyman F. C. Wood's bill, 950—1182, relative to the compensation of game protectors.

## Flies that Feed the Trout.

### A Few Notes by an Enthusiast.

NOTHING excites the ardent angler more than seeing a large trout rising steadily, which he cannot induce to take his flies. I am speaking now of fish that are really feeding upon surface food, and not playing. If the right fly is at last found and success follows, great is the joy of our friend. He attributes the result entirely to his own skill and feels proud of himself accordingly, and is apt thereafter to pay more attention to the natural flies that he sees on or about the water. There is no doubt that the study of entomology would add considerably to the interest of fly-fishing, at least in many of the streams of New York and Pennsylvania. I know of no work upon the subject that is of much assistance to the angler, and he will often be at a loss in trying to identify an insect which he finds is attractive to the fish. The habit is formed, however, of noting the flies as they appear, and he will often be astonished at the numbers which hatch out when the weather is favorable. He learns to be a good judge of color and size, and finds that a comparatively small assortment of flies will enable him to imitate the naturals, if he fishes in the same locality. The scientific side of the question, with Latin names, etc., is not of the first importance to the fisherman, yet I hope that in the near future some well equipped naturalist will take up the subject of stream flies. I believe that four families comprise the major part of the insects found on

the cold, clear brooks and rivers of the Middle States; the *Ephemeridae*, to which the May flies, red, brown and golden spinners, and the different colored duns belong; the *Perlidae*, stone flies, willow fly, etc.; *Diptera*, all the black gnats, etc.; and the *Trichoptera*, all the caddis flies. Ephemerids are very numerous and are easily known by the upright wings and long, tapering body, curved upward at the tail and terminating in two or three whisks, which are frequently mottled.

Nearly everyone has noticed the big stone fly which hatches out irregularly all through the season, when the weather is not too warm. I have never seen this fly in large numbers, though a yellowish stone fly that is a little smaller comes out in great force sometimes in the latter part of May or early June. As with all these insects, the temperature of the air and water has everything to do with the time when they appear. The wings of the stone flies lie flat upon the back when at rest, and are four in number. They make a fine show when expanded, and the fly itself is a fat and juicy morsel for the trout. I do not think that the fish get many of these insects in a perfect state, but when they are crawling about waiting for their wings to grow the trout have a better opportunity. I have found many in their stomachs. Everyone has seen the case which these flies leave upon the rocks after they have hatched out. I have an idea that one of our stone flies comes out of the larval case at night, at least I have found many cases of a rather small fly which I could not follow in its metamorphoses.

The *Diptera* form a very large family by themselves,

the first to appear being a black gnat with clear wings, early in the month of March. There are more or less of these little creatures about at all seasons, but I do not know much about them. Some are so small as to be scarcely visible without the aid of a magnifying glass.

The *Trichoptera*, or caddis flies, are a host in themselves, and their numbers are, at times, almost beyond belief. The larger members of this family make their houses of sticks, and until they are seen crawling about will be thought to be sticks in reality. Vast quantities may be found in many waters in the month of June. The smaller caddis use small stones and sand to build their homes. All are beautifully made, and are as smooth as satin inside. Trout when hungry will swallow the caddis, case and all. The remains of the cases can often be found in the stomachs of large brown trout, usually the stick kind. In western North Carolina the caddis is called "stick bait," and has always been used in trout fishing. The Indians of this State made use of the deer hair hackle or buck-tail fly long before the country was settled by the whites. I cannot vouch for this, but my informant was a gentleman who was passionately fond of "The Land of the Sky." I would like to know how the aborigines made their hooks.

All the water flies are quite hardy and are best to be observed in the early part of the season. As soon as the temperature of the water rises they cease to hatch out in any number. I say the temperature of the water, because one can find more or less flies about during the hot weather if he seeks the headwaters of the brook,

where it is cool. The hatch will be confined to the evening and early morning hours, as the hot sun is not favorable to any of these insects and may be fatal to some. In 1903, the month of March was unusually mild, many flies were on the water and trout were rising in our mountain streams just as they do in May. I have seen great numbers of ephemera hatching out in April, and have taken a basket of trout while the snow was falling. Of course, it melted about as fast as it fell; I do not mean that the air was very cold.

At first the trout are hungry and foolish, and will take almost any fly, but they soon learn to be cautious and discriminating. Some patterns of flies will kill more or less all through the season, but when the fish get well on to a particular color, more trout and a better average will be secured with a good copy of the natural. The color of the body is of the first importance. I remember a fly that was only good for a short time during one season, and that was a period of about three weeks in August. I have seen a few in subsequent years, but only a few. The water was low and the trout very shy, but, thanks to a good imitation of this small fly, I enjoyed most excellent sport among the large trout. I tried many experiments with other flies and compared results with other fishermen, and this fly easily led all others while the natural was about. In the matter of size (of fish taken), the difference was very remarkable. I have been led away from my subject proper. It is so easy to get off the track when writing on these matters.

I know so little of entomology that I do not pretend to instruct anyone. I only hope that a more competent person may take up the study of the insect life of our trout streams. I do not advise the slavish following of the imitative theory, I only claim that on some streams (particularly where there is much still water), a copy of the natural fly upon the water will often give one a good basket of trout when all other artificial flies are nearly, if not quite, useless. Again, big trout that confine themselves practically to a fish diet, are not often to be lured to the surface by small insects, yet may be taken by a large moth, particularly if fished for at night.

To me, the ephemera, or day flies, are the most interesting. It was formerly thought that they lived only for a day, hence the name. As inhabitants of the air, their life history is short, not extending over a period of much more than two weeks, I believe, in any member of the family, but as larval insects in the depths, they pass from one to two years. If the water is shut off from a mill race or any similar place, and the bottom proves to be composed of stones, sand and gravel, it will be found very interesting to appoint oneself a committee of investigation. The number of larva of various sorts and kinds will usually prove surprising. Many sizes will be found, brown, dull yellow, olive and dark orange are the common colors. All have good strong mandibles or pincers to seize their food, and all, or at least those I have found, of the ephemeral species, are active and full of life. When the time comes for these creatures to change their habitat, they swim upward to the surface, the shell of the larval forms splits down the back and the winged insect emerges, sometimes with a rapidity that almost defies the sight, and again slowly and with difficulty.

How the change can be made in the former way puzzles me. I have occasionally been able to take up a position directly above the place where the larva or nymph was coming up. In one instance the fly was a large one and I fancied that I could see the larva shooting up, the next instant two or three flies were floating down stream with their big wings erect upon their backs. In another instance, a very small insect was hatching out in swarms at short intervals. It was an unusually cold day, with blasts of wind and rain. After each flurry of wind and rain, the sun would peep out, and instantly the hatch would come on and the trout be seen rising all over the pools. Taking a small space on the water for observation, one moment it would be vacant, the next a dozen little flies would be dancing on the surface. What this fly was I do not know, but not an ephemera, possibly. I was too intent on my fishing during the short time that the fish were rising to catch any specimens and think that the flies were coming up too far out to do so, in any event. Strange as it may seem, a tiny cowdung fly was a good imitation of this natural, and I took 63 trout in a short time, returning all of these except the best fish. After hatching out, the ephemera have to undergo a second transformation, from the dun to the spinner, or perfect insect. In the former state the colors are quite dull and the wings opaque. As soon as their wings gain strength the insect flies to the shore and hides among the bushes. After remaining in this condition for some days, it sheds its whole covering, coming out in bright colors and with clear, glassy, sparkling wings. These wings, by the way, cannot be well imitated, and the best thing to do is to dress the fly with hackles only. (A hackle with dark center and golden edge answers for wings and legs.) As duns and spinners these flies do not feed at all, their only duty in this latter state being to perpetuate their species. The males may be seen dancing up and down in the air, usually in the evening. They are then on the watch for the females, which are quickly caught when they leave the bushes in which they have sought shelter. The nuptial rites take place in the air and soon after the females deposit their eggs upon the water. Their existence terminates soon after, as both male and female are reduced to mere shells. The little egg quickly sinks to the bottom, on which it finds a lodgment among stones and gravel. In a few weeks it becomes a larva, to follow its destiny as described.

When the stone fly wishes to change its shell it crawls out upon a stone and, gripping tight with its powerful claws, splits down the back and with considerable difficulty emerges. It is not in condition to fly, and is obliged to slink about under rocks, etc., until its wings are perfectly formed. It goes through no second transformation. I do not remember ever seeing stone flies heavily on, though I have seen great numbers in the act of laying their eggs. These were of the yellow kind, and, although they were extremely clumsy, often being carried down for several yards by the current, not a trout touched them. I was told, however, that earlier in the season they were well taken by the fish.

I know nothing worth mentioning in regard to the diptera or their life history. I have had fine sport with a small black gnat. It is a good pattern for night or

late evening fishing. The caddis flies hatch out largely at night, and are perhaps the most numerous of all the insects found upon our trout waters. They allow the angler few opportunities to study them, as he is too busy during the short hour or two allowed him after the sun is off the water to spare time to secure specimens or to study their life history. Quantities may be taken by means of an exposed lamp, however. We know that they hatch out in swarms and are well taken by the fish. They have the power of secreting a bubble of air at the end of the case, but I doubt whether this would enable them to rise to the surface, though I have heard that they did so. This is entirely unnecessary, as they move about the bottom from place to place, and can readily crawl out upon the shore or a stone when they wish to change their mode of life. They present a variety of colors, but the majority are brown, in many shades. The wings form a roof over the body and extend beyond it. The family of crane flies is a large one. The best known and most esteemed member being our friend the mosquito. Fortunately this is one of the smallest of the tribe, others being an inch in length. If we had mosquitoes of this size and proportionately ferocious, life would be intolerable in many parts of the country. The next best known is the hairy-long-legs, and I have found him in several colors, brown, dull orange and yellow.

No one who spends even a very little time in the study of insect life, can fail to be astonished by the infinite variety and great numbers of species, varieties and colors of these flies. They fill an important place in nature, acting as scavengers in the larval stage and feeding the fish all through their existence. The birds also take heavy toll at times and possibly other creatures. They are among the most beautiful of all insects, delicate in form and exquisite in color. To me the ephemera are more beautiful than any of the moths, wonderful as are the coloring and markings of the latter. We have seen several handsome books treating of moths, butterflies, etc., and with excellent illustrations. Considerable attention has been given to the inhabitants of stagnant pools and ponds, but the insects which feed the trout have been neglected in this country. Some day I intend to import all the English works I can find that treat of the subject, but we would like to be able to identify our native flies when found during our fishing rambles. Unless I am much in error we have a greater number of species, and there are such differences in the insects found upon streams and lakes in various parts of the country that no foreign work would be satisfactory.

From my small experience, I should say that the same species may not be found in waters not 50 miles apart. Some are common to all, while others are peculiar to a district or even to a stream. On a large river more big flies will be found. In petty brooks, the flies will be for the most part small, though the great stone fly appears nearly everywhere I have been in this State. It is said that we have several kinds of May flies, some of them much larger than the old country type.

We certainly have one fly bigger than anything to be found across the Atlantic. That is the horned corydalis, the larva of which fills such an important place as a bait for the black bass. I refer to the hellgramite, or doobson. This is a queer beast. I have seen it appear in large numbers early in June. That is, the fly hatched out at that time. Its habits are very peculiar, as after living as a larva in the rapids of our streams for a year or more, it comes out and burrows in the soil. Some people say that it returns to the water before becoming a fly, but I have found it in the transition stage upon land, before it was perfectly developed. All the corydalis I have seen were, when I observed them, headed up stream and were flying rapidly. One evening (it was always late in the afternoon that they appeared) I saw a number of individuals strike the water in a river where there were many trout, but they were not taken. I also caught several and threw them in at the top of a big pool without result. The trout were probably afraid of such a huge black thing. I have heard of the capture of at least one big trout with the hellgramite as bait, and there are few better for bass. I have but touched upon the subject of the flies that feed the trout, as I feel my lack of thorough equipment to treat it as it should be done. I crave indulgence for scanty information and probable errors, pleading my love for all things connected with fly-fishing in extenuation.

THEODORE GORDON.

## Fish Chat.

BY EDWARD A. SAMUELS.

### Our Old Darling, the Trout.

ALTHOUGH nominally our spring begins on March 21, there are then really but few indications of its arrival in most sections of the North and East; it seems at that time difficult to shake off the firm grip that old winter has held upon the face of the country. But on the advent of April, conditions have changed very considerably in many favored localities, and nature appears to have awakened from a long hibernation. The maple begin to blush with pleasure, the buds of the willows swell and blossom, and the birds are again arriving among us.

The song sparrow is trilling his sweet melodies in the sheltered thickets; an occasional robin is seen flitting about the pastures and orchards, and the black-birds are calling in the swamps. These, the earliest of our migratory birds, will soon be followed by other species, and, later on, there will come the insect-eating varieties which abide with us through the summer. The pleasure that all these bring to lovers of nature is beyond description, but the opening of the month confers an additional enjoyment on devotees of the rod and reel, for it marks in many sections the beginning of the open season for trout fishing.

### The Early Trout Gets the Worm.

Now, while it is true that the use of the fly at this early date usually brings but very poor results, one may occasionally find a spot where it may be profitably employed, but, generally speaking, the angler places his main dependence on the minnow or angle worm. There are some who do not care much for early trout

fishing, particularly those who restrict themselves to the use of the fly, and I have a friend who goes so far as to declare there is no genuine sport at fishing until the mosquitoes and black flies bite.

I understand fully what his meaning is and agree with him partially but not wholly, for I am one of those enthusiasts who desire to get all the fishing that is to be had, and am perfectly willing to "try my luck," even in early April when the winds are still far from balmy and the water is so cold that an occasional thin sheet of ice form along the shore at night when the mercury drops to the freezing point.

From the brooks and small streams the creel is filled by the use of bait; the fish are then ravenously hungry, their food supply being exceedingly limited, and the minnow or angle worm that is dropped in the pools and lurking places of the trout is seized with avidity.

I have another friend who maintains that he gets as much sport in following the meanderings of a brook, dropping his minnow here and there behind an old stump or rock or beneath the shelving bank of the stream in which the "trout do hide," as others possibly can obtain with the fly in more open localities.

Well, he may be right; there is a lot of pleasure to be derived from such sport, and it requires no small degree of skill to handle a good sized fish in most of the brooks in which trout occur, filled as they are with old stumps, roots of trees and submerged bushes.

There are many brooks throughout the country, such as, for example, those in Plymouth county and other localities in Massachusetts, in which the acme of pleasure is reached with bait fishing with the minnow. Fly-fishing is practically impossible, for they flow through heavy growths of alders whose tops almost touch above them, and the angler is obliged to wade a good portion of their length in order that he may reach the lurking places of the spotted beauties, upon whose backs are traced the hieroglyphics which from time immemorial have had for the devotees of the angle an indescribable charm.

### The Surface Fly.

But there are exceptions to every rule, and sometimes trout will come to the surface fly even if the water is icy cold, provided it is not very deep. I have proved this to my great satisfaction more than once. On one occasion I was out with the late Dr. John T. Stetson, of Boston, one of the most genial and companionable men I ever met, and an enthusiastic angler withal. We were fishing from a boat on one of the large submerged cranberry bogs in Tihonet in Plymouth county, Massachusetts, owned by Capt. Bessee; the water was nowhere more than two feet in depth, except where the ditches ran, in which places it may have been a foot or two deeper.

The day was bitterly cold—it being in the first week of April—and there was still a little snow left on the shores and a thin crust of ice flecked the weeds and grasses around the bog. It was about the last day one would choose for surface fly-fishing, but the Doctor and I had exceptionally good success, our catch being nearly four dozen between us. It is true they were not large fish, none of them exceeding a half pound in weight, but they were as lively and gamy as we could wish. The flies we used were the red-hackle, scarlet-ibis, fiery-brown-hackle, and the silver-doctor.

Now it is probable that if we had used angle worms or minnows our catch would have been larger, but we restricted ourselves to the use of the flies and employed them as surface flies at that; we could not very well have sunk them much for the water was too shallow. The fish, of course, were very hungry, and a hungry trout will come at almost anything that is in motion.

At the beginning of spring trout as a general thing fare on pretty short commons; there are no insects flying or spiders moving, and the larvæ of aquatic species and an occasional minnow are about all the food they can procure, and if we examine the stomachs of those we have taken we find but little in them, the larvæ of caddis fly, dragon fly and now and then a shrimp being all they contain. The fish are then, of course, not in the best condition, there being no fat around the viscera at all, and but very little in the flesh itself.

Six weeks later conditions have changed very materially, the caddis flies are awing, the May flies (*Ephemera*) are in great abundance, and myriads of other insects, worms and spiders, together with freshwater shrimps, minnows, etc., help to complete the menu of the speckled darlings. And if we then examine their stomachs we find that they are fully distended, there is an abundance of fat around the intestines and the flesh of the fish is rich and curdy.

The flies that I have mentioned above have been my most successful ones in early spring fishing, but in deep water, of course, I sank them well down. My father used to tie a fly that, for early trout fishing, was the most satisfactory of any I ever used. It had a pretty full red chenille body, yellow wings, and a rather thick reddish hackle; it was a fly that could be seen quite a distance well under the water, and it would always move a trout if there was one in sight of it.

My first success with it was at the Middle Dam, at the Rangeley Lakes, it was then very early in the season, the ice having but just gone out, and the water was, of course, very cold. There were nearly a dozen anglers at the camp, and all of them were using minnows or angle worms. They killed a number of large fish, for such were abundant in those days, but bait fishing did not give the real pleasure that the angler looks for, and so my father and I rigged up our fly tackle and took positions on the piers and boom just above the dam from which we began casting. The water was at least fifteen or twenty feet deep at that point, and surface fly-fishing was futile. We tried it for upward of an hour and got hardly a rise. At length I put on one of the red and yellow flies I have described and cast well out into the deep water; before recalling it I stopped to relight my pipe, during which interval the fly sank deep into the water. I lifted it gently and drew it toward me, fearing it might possibly get caught in drift stuff at the bottom. While I was thus moving

it, it was seized by a fish, the strong tug that it gave causing my pliable rod to bend in a short curve.

I played my fish, and on landing it found that it was a good two-pounder. From that time on my father and I did no bait fishing at the dam, for we got all the trout we wanted with the sunken fly. While the trout in early spring will greedily accept any lure you may offer him, he is more fastidious later on when the weather and water become warmer and there is an abundance of insects and other food; in fact, his caprices then have become proverbial.

All of us have, time and again, been unable to move a fin with any kind of a fly or even ordinary bait, but if we could catch a large, plump locust, and by that I do not mean the cicada, but the common field grasshopper, and impale it on a small hook attached to a thin casting line and toss it out upon the pool it was seized without any dallying. But one cannot always catch a locust, particularly in the woods through which most of the trout streams pass, and one would think the next best thing to do would be to select a fly that resembled the locust as closely as possible, but that does not always prove successful, no matter how lightly we cast it or slowly and gently we move it.

Now and then we may present a fly which overcomes his fastidiousness, but he accepts it perfunctorily, and not with the eager rush that every angler loves to behold. One often wonders why the trout ever comes to the surface fly, and that it often accepts most quickly the one which is the most outré of all combinations, resembling no insect whatever in nature.

#### Odd Flies

For example, the kertoodle fly, commonly called the toodle bug, that is, or used to be, tied by one of the Rangeley guides named Witney, is simply, entomologically speaking, a monstrosity; no one ever saw a moth, butterfly or any other insect that it in any way resembled, but what a killing lure it is for the big trout in September. There is something about it that simply fascinates those huge fellows who would disdain to even look at a smaller or less pretentious fly.

It is true that it was most successful when worked just below the surface of the water, but it generally had a strange attraction for the six, seven, and eight-pounders that lounged around at their ease in the deep pools and still water of the runs. In various ways have I at times endeavored to overcome the caprices of the spotted darlings, and have tried almost every fly in my book to no avail. One of my old guides, Steve Morse, used to say that "when they won't, they won't, and that's the end on't," but even when they are the most offish they may sometimes be outgeneralled.

#### A Mouse as Trout Bait.

On one occasion as I was fishing on a Canadian salmon river I reached a large pool, which, although it at that time contained no salmon, teemed with sea trout of a generous size. For some reason or other, strange to say, they did not seem to care for anything in the fly line that I presented to them. The water was rather low and almost as clear as crystal, and that, perhaps, in a great measure accounted for their reluctance to "come in out of the wet." I tried finally an exceedingly large gray hackle, which on being thrown out to them was quickly seized.

In angling nomenclature that fly is commonly called the gray mouse; no doubt it resembled a mouse, as it was drawn through the water, and it seemed to be just what they wanted.

"Ah, ha!" exclaimed my guide, "it's a mouse they want; all right, we'll fix 'em." I reeled in my fish, which proved to be a handsome three-pounder, but on lifting it from the landing net my guide accidentally broke off the barb of the hook. It was the only fly of its kind I had with me, and I about made up my mind I should get no more of the sea trout in that pool on that day, at any rate.

But my guide was evidently prepared for just such an emergency, for he took from his pocket the skin of a flying squirrel, from the belly part of which he cut a strip about three inches in length which he folded and tied to the shank of a bait hook somewhat after the manner in which a strip of menhaden is affixed to the hook as a casting bait for the striped bass. This he attached to my casting line and I threw it out into the pool. It was a queer looking object in the water, but the trout evidently wanted it, for they were not at all "backward in coming forward," and they all seemed to want it at once. It is perhaps unnecessary to state that I secured all the sea trout then that I wanted.

#### Frogs as Bait.

As I before stated there is no accounting for the caprices of trout, for they will at times take almost any old thing that is thrown to them for bait. On one of my outings at the Upper Dam on the Rangeleys I met a gentleman who had just come from Connecticut, he had never before done any trout fishing but seemed to be willing to learn. On the evening of his arrival we had a little chat, during which he showed me a good sized wicker hamper which he had brought along. On opening it he displayed to my astonishment about 200 small sized green frogs, huddled in a big bunch of damp moss, that he had brought for trout bait, evidently believing that since the frogs were acceptable to the black bass they would prove so to the trout. I told him I hardly believed that the Rangeley trout would care for the frogs, but he might try them.

The incident seemed very funny to me, and I could not resist telling the story to the other men at the camp. Of course, everybody had a quiet laugh, and on the following morning many suggestions were given the stranger regarding bait, etc., for the large trout in those waters. He was told by one of the anglers that a bunch of raisins often proved an irresistible lure; by another he was informed that the white of a fried egg was an acceptable morsel, and by another the yellow foot of a chicken was a famous bait.

The stranger "said nothing but sawed wood," and he sawed it pretty effectively, for when he came back to camp that night he brought with him five or six of as handsome trout as one would wish to see, and all of them were taken with the little green frogs for bait.

## The Pike: What to do With Him

BY L. O. ARMSTRONG.

Read before the North American Fish and Game Protective Association.

I HAVE a feeling of respect, amounting almost to admiration, for the maskinongé. I love the doré, or wall-eyed pike, or golden pickerel, on account of his beauty and his flavor, but to the common pike (*Esox lucius*) I confess at the outset I am a mortal enemy, and therefore I must try my utmost to do him justice. Dr. Warwick claims for him that he can show intelligence, affection and gratitude. This is his story of an experience with an English pond pike. It is a pretty story; even those who know it will not, I hope, object to its repetition.

"When I lived in Durham," says the Doctor, "I was taking a walk one night in Lord Stamford's Park, when I arrived at the pond where fish destined for the table were temporarily kept. I noticed a splendid six-pound pike; when he saw me he darted away like a flash toward the center of the water. In his flight he struck his head against an iron ring in a post. I found out later that he had broken his skull and wounded the optic nerve. The fish was evidently suffering terribly; he darted to the bottom and buried his head in the mud, turning with such rapidity that he was lost to my sight for a moment. Then he plunged madly hither and thither in the pond, and finally threw himself out of the water on to the shore. I examined him, and found a small portion of the brain coming out of the skull. I replaced the brain with care, and rounded the brain indenture. The fish remained quiet during the operation; when it was over it plunged into the water again. It seemed at first to be much relieved; but at the expiration of a few minutes it began again wildly to plunge in every direction, and finally threw itself out of the water again. It continued to do this several times in succession. I was deeply interested. I called the guard, and with his assistance I applied a bandage to the fracture, threw it back into the water and left it to its fate. Next morning when I appeared on the water's edge, the pike came to me, placing his head close to my feet. I found the incident extraordinary. I examined the skull and found it to be doing well. I walked along the shore for some time; the fish swam as close to me as he could to and fro, turning when I turned; but as he was blind on the wounded side, he seemed to be agitated always when his wounded eye was next to the shore. Next day I brought some friends to see the fish; the pike swam toward me as usual. He gradually became so docile that he would come near when I whistled, and ate from my hand. With other people, to the contrary, he remained as shy and wild as ever."

Gentlemen, what do you think of that story? If true it makes one feel a stronger and more human interest in our finny fellow-beings, but nevertheless with them the law of the "survival of the fittest" must work, and I hope that it may work a little more actively on account of our helpful action as an association.

During a recent canoe trip on the Mississauga River in Ontario, Can., I met with a black-backed, pink-fleshed pike, which was gamey; he rose to the fly and broke a salmon-rod for me without my being conscious of any extraordinary clumsiness on my part. His size was not great enough to account for the discomfort that I felt in being worsted by him; and after helping to eat him, his firmness and flavor made me temporarily more tolerant of this water "bully and tough," but I have recovered and am ready to make a declaration of war against the pike. Wherever he is to be found I would Russianize his territory.

I would let flourish, and would ever help along the colonization of our waters by that favorite of mine, the doré (*Lucioperca americana*), or pike-perch. That grandest of fighters and bounteous giver of sensations, the maskenonzay, as Mr. Henry Wadsworth Longfellow, after the Ojibway fashion, correctly spelled and called him in "Hiawatha," I would foster; but I would make war upon the vulgar pike.

Some of my friends would have me include all the members of the pike family in the declaration of war. They say to me in protecting doré, bass and maskenonzay are you not helping to destroy the trout, ouananiche and salmon? To some extent, perhaps; but in them I am protecting game fish of such delicious flavor that I find my palate to have many sympathizers when it says it can enjoy these three fish many more times during the year than trout or salmon, which are a little rich. In fact, I do not know of any occasion when my great friend, the palate, would not rebel against my declining an invitation to dine on either doré, bass or maskenonzay and Sauterne.

My fishing for doré and maskenonzay has been done in Canadian lakes in the far north, where they are a table luxury in any month in the year.

But now, to be practical, let me ask you the question, "What are we going to do about it?" and at the same time give the answer from my point of view. I would propose then that this Association recommend to all the Governments that "No netting should be allowed except for pike, suckers, ling, catfish, whitefish and other coarse bottom-feeders. That all game fish should be returned to the water until September 15, 1905." All commercial fishing companies should raise every other kind of fish just as meat canners raise their beef or mutton, or buy from those who have raised them. All other fish than those mentioned as being permissible should be caught by rod, hook and line only. This would give more work to local fishermen and as much pay. It would hurt only the few shareholders in the big commercial fishing companies, and these should be hurt if any hurt is to be received.

I have been shocked at the waste of the net-fishermen in Lakes Superior, Huron, Erie and Champlain. They have almost destroyed the fishing in Lake Ontario. At Sarnia and in Lake St. Clair the catches of doré in seines have been enormous. Let us put an end to this kind of fishing.

The Canadian conscience is being awakened about the fishing in the Great Lakes and in Temagami, Lake Champlain, and I think the action of this Association has had something to do with it.

Incidentally, I cannot refrain from referring to spring shooting for ducks. The duck is our ally in destroying

the pike-spawn in the spring. Let us make an offensive and defensive alliance with the spring duck. I have watched mother ducks diving for the pike-spawn, and have seen her fight to protect her young from the pike. I could not get near enough to see how she conducted the fight, but I saw her go down many times for the spawn, and saw that, in spite of many rushes of the pike, the parents and children of the duck family got away safely.

Resolved, that the North American Fish and Game Protective Association ask of all Legislatures that such legislation be enacted as will make it illegal for anyone to net trout of any kind, except *namaycush* or lake trout, bass of any kind, doré or wall-eyed pike, or maskenonzay, until Sept. 15, 1907, and that all legislatures in their publications should use the Indian name of the fish sometimes called muskullunge—mascalonge—maskinongé, and that it should always be spelled in the Indian way as found in Longfellow's "Hiawatha," viz.: "Maskenonza," with the a hard—Maskenonzay, or according to the governmental pronunciation in Canada—maskinongé.

Is there need of this or of some other more effective action? Let me tell you that there is. I met some farmers last year who were about to gather together to ask the Government to send them some pike for summer-fishing because they "grew fast and were easy to catch." These farmers lived on a lake well stocked with lake trout that were, however, not easy for them to catch in summer. There is a largely-signed petition at Ottawa, Canada, sent in by the citizens of Stony Lake, County of Peterboro, asking for a pike hatchery; the reason given being that there had been a great destruction and reduction in the number of pike in the region, whereas salmon and trout had increased notably for some years. These are intelligent people, good farmers and citizens, and yet do they not remind you of the frogs who asked for a king and got the heron? Do you not see in them the lambs asking for wolves to come and crunch their tender bones? We must protect these and all other lambs from the common pike, that fresh water wolf, that shark of the inland lakes. Let this fish make room for a better species. He is a thief and a black-guard. Let us kill him any way we can; let us pitchfork him in the shallows and small creeks, spear him, shoot him, set night lines for him, net him, destroy him by fair means or foul; he has no friends among the wise and the good.

## The Strike in Sea-Fishing.

To strike at the right moment, and with a nice judgment, is one of the most useful arts at the command of the angler. It can be compared only with the gradual pressure on the trigger in deer-stalking. The pull-off that jerks the rifle is fatal; it is the gentle squeezing of the trigger that does the trick and drops the stag, and it is the accurately-timed upward stroke of rod or line that hooks the fish. Now, in fresh-water angling, where there is more often than not a tell-tale float to betray the movements of the hidden fish, striking is a dainty art—a mere flick of the fingers or turn of the wrist. Where a tiny hook has to be embedded in a delicate fish in a few inches of water, science is evidently of greater moment than strength. When, on the other hand, a large hook has to be driven home in a pollock or conger feeding in a strong tideway, and perhaps a couple of hundred feet below the fisherman, it is clearly necessary to strike, not merely at the right moment, but also with considerable force. The right moment can be gauged only with practice, for there is no float, as a rule, and the fish are almost always out of sight. As an exception to the last-named condition, I well remember drift-lining for mackerel of great size off Mevagissey. The water was as clear as crystal, and we could plainly see the great mackerel, weighing up to 2 pounds and 2½ pounds, darting in every direction quite three fathoms beneath us. The bait was pilchard, and we had only to lower the heads and then lean over and hook each fish as the bait disappeared in its jaws. I fancy we caught the best part of a hundred, and they were all given away on the quay. That was a red-letter day, but, as a matter of fact, it savored rather of hooking tame carp in a pond, and if all sea-fishing were so simple the sport would have fewer admirers.

It is when the fish are invisible that striking is difficult. You may strike a fraction of a second too soon or too late, with as much result as firing a yard too much before or behind a driven pheasant. The fish is doubtless injured, like the bird, but you are none the better off. Indeed, the late Matthias Dunn, of Mevagissey, accounted for the malformed sea-bream, which are not uncommon in the neighborhood of Plymouth, by the fact of fishermen striking impatiently when troubled with chads, as the bream are called in their youthful stage. The striking, which would not catch such small fish on the large pollack-hooks, tore away the upper portion of the jaw, he maintained, and these chad in time grew to be bream with a distorted face. I have, indeed, known woeful amateurs who prided themselves on foul-hooking really good pollack and whiting, baiting their hooks and then continuously striking (like the manner in which Scotch herring fishermen work the jigger lines) until a fish, prowling round the baits, would be hooked. This, however, is wanton pot-hunting and not fair fishing.

The exact moment at which to strike must, as was said above, be learned by experience. Every fish lost in this way is a step in the education of the sea fishermen—that is, if he takes intelligent notice of his error and endeavors to correct it. The general principle is to strike as soon as possible after first feeling the bite, and "as soon as possible" means in this case some portion of a second. Some fish, notably large pout, give a second and even a third chance, particularly when some tough bait like squid is used. Others, like mackerel, generally rob the hook of the bait at the first nip. The conger eel, again, sucks at the bite in gingerly fashion, and it is important to abstain from striking until the hook is really in the mouth of the fish. In short, the correct moment of striking can be learned only by personal study of the manner in which each fish takes the bait. These matters baffle description, and must be acquired at first hand.

About the manner of striking, however, particularly in deep water, there is no doubt in my mind whatever. The

stroke must be firm and to the point. If using a rod one of two plans may be adopted. Either the rod top may be smartly flicked upwards through a good two feet, or else a couple of feet of the line may be pulled smartly back through the rings. The latter method will be voted heterodox by those stylists who say that the line should never be touched in any circumstances, being manipulated only with the winch. In ordinary circumstances I am in perfect accord with this canon of angling, but there are cases in which striking a fish can be satisfactorily accomplished in deep water (especially when the hook is not as sharp as could be wished) only in the way indicated. With hand-line fishing there is less difficulty. The line is held between the thumb and forefinger of the right hand, the hand being kept inside the gunwale, and the moment a bite is felt the clenched hand is drawn smartly towards the body, as firmly, in fact, as if the angler were pulling up a runaway horse. This may at first sight appear a considerable expenditure of energy to hook a fish, but it must be remembered that a great deal of the energy is dissipated by the depth of the water, the force of the currents, and the inertia of the lead and wet line.—F. G. Alfalo in the County Gentleman.

### News from New Bern.

NEW BERN, N. C., April 1.—*Editor Forest and Stream:* Who do you s'pose I met here one day this week? Give it up? Well, it was Charles Hallock. Yes, it was; old Charles Hallock, the man that gave FOREST AND STREAM such a boost that it has never been able to stop itself since.

I say "old" because, compared with us young fellers of fifty odd or sixty, he is old. But you'd never imagine he had passed the three-score-and-ten mark, which he has, for his cheeks are as rosy, his eyes as bright, and his step as springy ("near about," as they say down here) as they were in the eighties when he was living in New Bern and booming it for all he was worth.

It is just possible that your readers may hear from him shortly, for I told him a heap o' things that would make good copy.

I have been here for two or three months every winter since 1898, and hope to "do so some more," as the climate is much milder than that of New Jersey and living more reasonable, while quail, snipe, ducks and deer abound in the surrounding woods and marshes.

Thanks to the educational efforts of the Audubon Society in spreading useful information about birds, the white and gray gulls which winter here have, by their tameness and increased numbers, added a great attraction to the water front along the Neuse River. Thoughtless men and boys no longer shoot at them from the river bank, and being unmolested they fly or swim about quite close to the sea-wall which skirts the promenade, and will fearlessly pick up scraps of food thrown to them. This, to strangers, is intensely interesting, and recalls the interest displayed by visitors to the Charleston Exposition in the flocks of wild ducks which found a safe asylum in Colonial Lake, and along the waterfront of the famous South Battery.

Fishing for black bass, whose local name is Welshman, is good now and getting better every day.

Both live bait and spoons are used, and the fish run in weight from two to six pounds. Later in the season other kinds of fish are taken in large numbers, but the Welshman is the only game fish, strictly speaking, that is found in this vicinity.

J. L. KEARNY,  
(of Perth Amboy, N. J.)

### The Salmon of Bangor Pool.

BANGOR, Maine, April 2.—*Editor Forest and Stream:* The first day on which it is allowable to fish for salmon is April first, and on that day there are always several enthusiasts, who usually are market fishermen, casting for the first fish of the season. This first salmon always

brings a high price, about \$1.25 a pound, and the fishermen are very eager to land the prize, both for the pecuniary profit and the record. Nearly every year the first day records the first fish, and then there are times when it is a long time before the second fish is taken, while at other times April shows a fairly good record throughout the month. Old anglers contend that the fishing at this pool, once famous for its salmon supply, is better on those seasons when the leaving of the ice is marked by a freshet, but there is no freshet at all this year. Although the ice is so rotten in the river now, being in fact clear most of the way between the Bangor bridges and the sea, there has not been freshet enough to force it out thus far. Above the bridges there is an almost unbroken sheet of ice to the pool, and in the pool itself several boats are manned by the hardier souls, who have landed three fish to date. One, a trifle over 18 pounds, was caught by Thomas F. Canning, the other two being a racer and a kelt. The ice will probably go clear to the dam before Monday, and after that date the fishing will be carried on with unabated vigor and perseverance. It is a bit unusual, that whether a man fishes for sport or market, he must use the artificial fly if he would have success with the aristocratic sea salmon, while in other fisheries the market fisherman frequently may, and does, resort to less sportsmanlike methods of luring his fish.

HERBERT W. ROWE.

### St. Lawrence Fishing.

WATERTOWN, N. Y., March 27.—*Editor Forest and Stream:* In your issue of March 26, Dr. C. E. Latimer asks what causes the difference in the fishing on the St. Lawrence River. I claim that it is the absolute prohibition of netting in these waters. Why does he have better success in those distant waters? For the reason that in those waters the use of nets is permitted at certain seasons of the year for the removal of the coarse fish, many of which are the natural enemies of the game fish. I would suggest that the Anglers' Association of the St. Lawrence River, instead of meeting next summer and passing the "usual resolution," select a committee of intelligent sportsmen to investigate this matter as to why the fishing is so much better in those distant waters. In Chaumont Bay we have a practical demonstration of benefits of the removal of the coarse fish; our fishing has improved each year, until now we have the best small-mouth black bass fishing in the State. Just so long as the anglers of the St. Lawrence let law protect the sturgeon, eel, lawyer, bullhead, sucker, mullet, sheepshead, rock bass, perch, and sunfish, just so long will their fishing grow poorer each year. I will guarantee that if the provisions of Sec. 74, of the game laws are applied to the St. Lawrence River, the doctor will not have to go to those distant waters to get a mess of fish.

W. H. TALLETT, President,  
Jefferson County Sportsmen's Assn.

### Maskinongé or Maskenozha.

MONTREAL.—*Editor Forest and Stream:* I have fished since boyhood among the Ojibways for maskenozha (as Longfellow spells it in his lines, "When he saw the fish rise upward, saw the pike, the maskenozha") and among the French settlers for maskinongé, and I have never heard among either of them the term "mascalonge" or "muskellunge," which are to me, clearly, corruptions of the Ojibway word, as "Chippeway" is a corruption of the word "Ojibway," and like that a corruption that is not liked by the Ojibways. The Ojibways have named our rivers—the Mississippi, for instance—and our lakes to a large extent, and to me it seems very clear that their pronunciation, or the French, which is almost identically the same, is the correct pronunciation. I do not think that "common consent or custom" should establish an error; but in our northern country at least there is no common consent as to mascalonge. That word has been imported and taught to the guides by the importers. I

am very sure that from eastern Ontario to the mouth of the St. Lawrence, among French and English alike, and to the west of the Ottawa as far as Lake Winnipeg among the Ojibways and English and French the words in general use are maskinongé according to the French, and maskenozha according to the Ojibways.

In the United States there are admittedly five ways of spelling the corruption. Which is the correct?

J. O. ARMSTRONG.

### Texas Tarpon.

TARPON, Texas, March 28.—I inclose you record of tarpon caught from 17th of March to 26th:

F. S. Parmelee, Omaha, Neb., one.  
J. R. Wainwright, Pittsburg, four.  
W. B. Young, New York, eight.  
D. T. Beals, Kansas City, four.  
Geo. R. Barse, Kansas City, four.  
Lee Clark, Kansas City, one.  
Miss Violet Coen, Chicago, one.  
Miss Virginia Gillette, San Antonio, two.  
Geo. W. Jones, Kansas City, two.  
W. E. Thorne, Kansas City, one.

J. E. COTTER.

### The Kennel.

### Virginia Field Trials Association.

RICHMOND, Va., March 28.—A meeting of the Virginia Field Trials Association was held in Richmond, Virginia, recently. A good number of members were present. The main object of the meeting was to fix the date of holding the trials for 1904, and to appoint a committee to select new grounds. The committee which consists of Dr. Leigh Buckner of Roanoke, Mr. E. P. Wilkins of Riverton, and Mr. Charles B. Cooke of Richmond were instructed to visit Martinsville in Henry county at the junction of the Norfolk & Western and the Danville & Western, to look over the grounds and make all necessary arrangements, if they be found satisfactory. The date fixed for holding the trials was the week of November 28, beginning Tuesday morning November 29. The club will add \$25.00 to the purse, in open all-age stake.

There was quite a discussion in this meeting of the question of requiring dogs to retrieve. Most of the old school dog men in Virginia think that a bird dog is not worth anything unless he will retrieve, and they lay great stress on this one point. The matter was finally compromised by adopting the following rule: Retrieving shall be considered in the members' all-age stake only, in determining the winners.

The following committee was appointed by the chairman to select judges for the trials: Mr. Polk Miller, Mr. J. C. Tignor, and Mr. Chas. B. Cooke. Letters were read from the President, Mr. Geo. G. Herring, and other members, regretting their inability to attend the meeting. The club is in a prosperous and flourishing condition and is making a change of grounds solely in the interest of the association, and the desire to furnish plenty of birds. From the report of members who are training young dogs and grooming their older ones, the 1904 trials will be bigger and better than ever before.

CHAS. B. COOKE, Secretary.

### Points and Flushes.

FROM a correspondent we have received information that a libel suit has been instituted on the part of the judges of the recent field trials at Grand Junction, Tenn., and by the United States Field Trial Club, against the American Field Publishing Company of Chicago. The alleged libel is stated to have been published in the American Field of Feb. 6.

### A. C. A. National Meet, Sugar Island, Thousand Islands, St. Lawrence River, August 5-19, 1904.

#### Red Dragon C. C.

BY W. K. PARK, RED DRAGON C. C.

ON THE west bank of the Delaware River, a few miles above Philadelphia, the Red Dragon C. C. rejoices in the possession of a typical canoeist's home. Here a number of congenial spirits meet, exchange ideas and give and take advice on things appertaining to aquatic life. Here they hold forth the year round, resting in the shady grove, or paddling, or sailing, or swimming, or perhaps, wrestling with an obstreperous "choo-choo" boat during the sweltering summer months. Here they shoot at clay targets, or skate, or tinker with canoes, or remodel launches and other craft during the dreary winter period.

The Red Dragon C. C. was formed in 1887 with a

home on the New Jersey side of the Delaware. A year later the Keystone C. C. amalgamated with them under the name of the Red Dragon C. C. of Philadelphia. At that time they had headquarters at Cooper's Point, Camden, N. J.

Canoeing became a popular recreation on the Delaware, and the membership in the new club grew rapidly. In December, 1889, misfortune frowned upon them and fire wiped out all their belongings. Undaunted by this blow they went to work and soon had a new home and a fleet of twenty new canoes, making the club stronger than ever. Additional members were received, and for more than a year the Red Dragons were happy and prosperous. But a year later fire again visited them and a second time the canoeists saw their home and fleet destroyed.

Two such disasters was quite disheartening, and it

was with much difficulty that the organization was held together. In 1891 the faithful few selected a home near Wissinoming, Pa., eight miles above Philadelphia. Six canoes and a St. Lawrence skiff comprised the fleet, and eight members were ready to again paddle against the stream of adversity and battle the tide of misfortune ultimately to reach a peaceful harbor. At this time Fred W. Noyes was commodore and A. S. Fenimore, purser. These men worked faithfully for the club's welfare, and to them much praise is due. Others who helped at that period were R. G. Fleischmann, H. C. Blumner, W. Gray and Dr. F. O. Gross. To the last named great credit must be given for his influence in securing the present comfortable quarters at Wissinoming.

In May, 1892, the Red Dragon C. C. took possession of their new home and shortly afterward gave a re-

gatta, which drew many canoeists from other places. So pleasant were the surroundings that a number of the Mequonnois C. C., of Camden, became members of the Red Dragons, adding much strength to the organization. From this period the club grew and prospered, and the names of such zealous canoeists as Maurice D. Wilt, Dr. Buckingham, H. E. McCormick, H. M. Rogers, Harry Fleischmann, H. E. Bachmann, W. J. Scott, Joseph Edward Murray, Lloyd Titus, J. M.

A Red Dragon Camp at Delanco, N. J.

Hamilton, Omar Shallcross and E. W. Crittenden were added to the roster. Sailing canoes were much in favor at that time, although the paddling canoes had their devotees.

From 1895 to 1900 new men came in who enjoyed the double blade and such enthusiasts as E. D. Hemingway, Chas. Zimmerling, Harry E. Davis, A. D. Shaw, T. W. Cook, Tom McGinley, W. K. Park, W. Bachmann, and F. A. Hookey soon made cruising a popular form of recreation.

Each year the Red Dragons held regattas which became immensely popular with the lovers of aquatic sports. After each meeting of this sort new applicants for membership were admitted, and within the past three years the club has added such active workers as J. C. MacLister, W. C. Thompson, Wm. Overington, Jr., Paul S. McMichael, W. H. Logan, Jr., Edwin K. Merrill, W. H. Wolstencroft, Chas. W. Swift, C. Alfred Sparmaker, Theodore Quasebart and Clifton T. Mitchell. Nearly every new member added a canoe to the fleet, and special quarters were constructed on the club grounds with racks, fitted with rollers, the building being large enough to accommodate thirty

The End of the Red Dragon C. C. Pier, Delaware River.

canoes. At the present time the fleet consists of twenty-one cruising canoes, two racing canoes, one sailing canoe, three gunning skiffs, one Cape Cod catboat, four launches and six yawls.

The home of the club is an ideal place for the enjoyment of river life. The property consists of several acres of well-shaded ground facing the Delaware River. The house is a historical mansion, over 100 years old, quite surrounded by a grove of fine old trees. The interior is of the colonial style, the old-fashioned fireplace lending a peculiar charm, particularly on a winter's evening when the logs are cracking and blazing cheerfully and the boys are seated around, sipping musty ale and making merry with song and story.

On the first floor is located the reading and smoking room, the walls being decorated with trophies, relics, models of canoes, photographs and appropriate pictures. Adjoining are private rooms of members. On the second and third floors are other rooms, each shared by two men, who have fitted their quarters according to their own ideas; some with art decorations and pictures depicting scenes upon the water, others with game panels, shooting scenes or trophies of the field, each showing the individual taste of the occupants.

On the second floor the janitor's family have quarters. In the basement of the house the "Raths Keller," now called "Snug Harbor," permits of suppers, informal gatherings or club smokers where the quaint surroundings and immense fireplace invites sociability and reminiscent reveries.

In the rear of the mansion is a tennis court, an inclosed kennel for the hunting dogs of the club's sportsmen, and several cabins where the members do their cooking and eating during the summer months. In the front of the club house, and extending out 150 feet over the river is the club wharf. At the further end is a sliding gangway and floating dock. At the end of the wharf proper is a broad "look-out" supplied with seats and chairs. In the summer evenings when the city is suffering from the heat the Red Dragons and their friends gather here and pass pleasant hours fanned

by the cool breeze from the river, at times listening to the soft music of the mandolin and guitar.

During the winter months the wharf is put to another use, the gun exponents getting out traps and fitting it up for shooting at clay targets. The sport is indulged in on Saturday afternoons, and many spirited contests are held, several of the members being experts with the shotgun.

The Red Dragon C. C. has been quite prominent in the A. C. A. meets, and in 1894 they sent a large delegation to Croton Point, taking first prize for the best club mess. The A. C. A. has on two occasions bestowed upon members of the Red Dragon C. C. the honor of being chosen vice-commodore. Fred W. Noyes and Joseph Edward Murray, each serving one term. During the latter's term in 1897 a notably successful cruise was given on the Delaware River from Easton to Philadelphia, Mr. Murray being in charge. This club has been represented in the A. C. A. races for several years past, and some of its double blade experts have returned with well-earned trophies.

Cruising and camping is one of the delights of the Red Dragons, and every season several of the members cruise from Easton to Trenton, a charming two days' run. Other short cruises are made on the Pennypack and Neshaminy Creeks on the Pennsylvania side, and the Pensauken and Rancocas Creeks on the New Jersey side of the river, a run of nearly fifty miles being possible on the last named stream—if attempted before mosquito time. These cruises are usually only a day's outing, but at times a longer cruise is made on one of the larger creeks, taking an afternoon tide fifteen to twenty miles, camping, or stopping at a

View of the Front of the Red Dragon C. C.

country hotel over night and returning with the tide the following morning. Such runs are always well attended by the members, and often the wives of the more fortunate ones go along to share the delights of the trip.

Two or three times during the season several of the members who prefer camp life to cruising stake their tents in a shady spot near Delanco, N. J., five miles above the club house, or on a pretty island in the Rancocas Creek twelve miles away. Many pleasant camps have been established at Delanco, and on one occasion the Atlantic division of the A. C. A. held a meet here.

Club regattas are given in June and September, handsome prizes attracting canoeists from various clubs along the upper Delaware. The programme is always a varied one, and the paddling races, single and double, swimming races and tilting tournaments form exciting affairs.

The success of the Red Dragon C. C. is due in a great measure to the interest taken by each individual member. There are none who shirk their duty, and drones

Fireplace in Main Reading Room of the Red Dragon C. C.

or bores are not allowed to remain long in the club. To become a Red Dragon required something besides the name of being "a good fellow." Active boating men are the only ones who ever receive membership. It is an organization of gentlemen who have similar tastes and inclinations. One excellent rule of the club is that of "no treating." While the utmost sociability is always manifest among the members each man pays his own way and the poorest one feels equally at home with the richest, whether at a theater party, a club supper or an informal gathering.

To show the energy and love for work possessed by some of the red-blooded ones, it is only necessary to look at the log book. This shows that during the season of 1903, Paul McMichael paddled 625 miles, J. C. MacLister 583, W. H. Logan, Jr., 254 and M. D. Wilt 253. These men each received a handsome trophy offered by the commodore to all who paddled 250 miles or more during the season. A dozen other members proved their muscle by covering from 100 to 200 miles. In the racing J. C. MacLister, M. D. Wilt, Paul Mc-

Michael, T. W. Cook, E. D. Hemingway and H. E. Davis are among the leaders.

The present officers of the Red Dragon C. C. are: Com., J. C. MacLister; Vice-Com., W. C. Thompson; Purser, W. H. Logan, Jr.; Quartermaster, Harry W. Fleischmann; Fleet Surgeon, F. O. Gross, M.D.; Meas., Harry Blumner; Correspondent, Will K. Park; House Committee, W. H. Wolstencroft, M. D. Wilt,

A Corner of Com. MacLister's Room, Red Dragon C. C.

P. F. McMichael and H. E. Davis; Trustees, Joseph Edward Murray, A. S. Fenimore, E. D. Hemingway.

The Red Dragon C. C. club house has no latch string out, as the door always stands wide open to all fellow canoeists.

## Camping and Canoe Cruising in Canada.

BY R. W. ASHCROFT.

### The Outfit

TENT, 7x10, with poles (Indians carried their own tent). Ax, two lanterns, four tin pails (nested), two frying pans with covers, one mixing pan, one cooking spoon, six each tin cups and plates, six each knives, forks and spoons, one broiler.

In addition, each man carried: Two pairs blankets, one sweater, rain coat, soft hat, two woolen shirts, two suits underwear, four pairs socks, one pair shoes, one pair rubber shoes, one pair waders, two pairs trousers, and half a dozen handkerchiefs. Other odds and ends

Red Dragons in camp at Delanco, N. J.

according to the eccentricities of the individual. Each kit being inclosed in a large sheet of table oil-cloth, which was used at night underneath the blankets.

The Commissary Department's list was as follows: 20lbs. bacon, 1 peck potatoes, 25lbs. flour, 10lbs. rice, 10lbs. corn meal, 5lbs. dried prunes, 5lbs. dried apricots, 10lbs. sugar, 6 tins baked beans, 1lb. Lipton's India Ceylon tea, 2lbs. Lion coffee, 2 lbs Plasmon cocoa, 2lbs. Plasmon chocolate, 1 dozen boxes safety matches, 1 dozen wax candles, bag of salt, can of pepper, can of baking powder. Milk, butter, eggs, fresh meat, potatoes, etc., were procured en route from the settlers.

'Way down upon the Scugog River—the good old Scugog. That was where it commenced on a bright, sunny morning toward the end of last June.

The Scugog, however far removed from euphony its name may be, is nevertheless a stream of pleasing parts, flowing from the lake of its name to Sturgeon Lake in Ontario.

There were four of us, weary of New York's asphalt trails and "long-green" angling, and, as it proved, no church choir ever boasted a quartette who blended more harmoniously.

To the "Guv," it was a home-coming. He was born and raised on that river, lucky fellow! Even the bullfrogs knew him, and hoarsely croaked a welcome. Every summer, for nigh three decades, has his paddle fondly kissed those waters, and their wildness and their beauty have, for him, lost none of their charm and magnetism. Nor did we wonder at it!

The noble Casker had accompanied the "Guv" the year before, and the memory of his experiences then served only to whet his appetite for more. As the Gaffer aptly remarked to me: "Cinders," said he, "Tom Jones' avidity for the fair sex was mild compared with Casker's hunger for the trout and bass of Ontario."

Faithful old Zack Knot was there waiting for us. The Ojibway tribe may well be proud of him. A

grandfather is he, who has fished and hunted and trapped and guided in these woods and waters for many a year. Johnny, his youngest boy, a child of nature, was with him. We guessed why, before the final handshake; as, during the trip, our thoughts often joined those of the old guide as he fondly gazed at the boy's face, and we, too, saw therein the wistful, silent features of the squaw mother who had departed for the happy hunting grounds a dozen summers since.

The three cedar canoes, trim craft from "clew to earing," 16ft. long over all, were loaded to within a couple of inches of the "gunnel" when we weighed anchor. Despite our attempt to "go light," and the fact that before leaving we did discard about one-third of the canned luxuries on our anti-hunger list, we had about all we could carry, and were somewhat fearsome of choppy weather on the northerly lakes.

Merrily we dipped our maple paddles into the water, gently floating with the current down the Scugog, and then paddled through a submerged marsh, full of fallen timber and tree stumps, into Goose Lake. Though somewhat early in the afternoon, we commenced to troll for "lunge," using a medium-sized copper spoon. For an hour, we struck nothing but snags and weeds, and then a smile o'erspread Zack's kindly face. His trolling line was wound around his knee, in order to facilitate paddling. Concurrently with the smile that enveloped his visage, I, who was in his canoe, observed a suspicious twitching of his knee.

"I've got him!" he whispered delightedly, and commenced to pull in his line, hand over hand, while I stood ready with the gaff.

To land the first fish is one of the honors of any angling trip that all try to achieve. Until then, every one is on the *qui vive* and keeps eyeing the other craft with anxiety, lest one of them should win the prize. Strikes are kept religiously dark, until one knows whether it is the real goods or some sophistry. I had gaffed a magnificent maskinonge before our triumphant howl reached the ears of the occupants of the two other canoes. The sobriquet "lunge" is a fitting one for this fish, as they are, most assuredly, fierceness personified while they last. They swallow the bait with a vengeance, and it is often necessary to cut one's line and wait until supper time before one's favorite spoon may be secured for further service.

A two-pound small-mouthed bass by ye noble Casker, and a ten-pound "lunge" by ye humble Cinders, completed the day's score; and we put up our canvas at Camp Pleasant, on the Fenelon River, about half a mile below the falls.

The Gaffer always slept late. We could never root him out before 5 o'clock. The first morning was the exception to the rule, for, at about 4:30, an unearthly howl of terror emanated from the tent. Out jumped a squirrel, and made for the nearest tree. Then came Gaffer, panting as though he had been wrestling with a bear. The squirrel had been squatting on his chest.

We did stunts that day, portaging over Fenelon Falls, and then hustling across Cameron Lake to the slide in Rosedale River, which was reached at noon. It was here that Casker caught his bass—three of them, aggregating ten pounds, all from the one pool, and within ten minutes. All you've got to do now is to whisper "Rosedale" to Casker, and he'll kick up his heels like a young colt.

Balsam Lake is an ugly one on a windy day, so, instead of camping on Bald Island as intended, we took advantage of the pleasant weather and consequent smooth water, and hiked across and up Gull River to Camp Whippoorwill, dropping anchor about a mile below Coboconk.

The next morning—'twas Monday—we raided Coboconk for supplies. We asked for bread, but couldn't get a crust. They bake once a week in Coboconk, and that on Monday afternoons. We invested in a sponge, and a can of white lead, too, as one of the canoes showed signs of porosity. After plastering any apparently dilated seams of this Jonah craft with the lead, we lifted all three canoes across the dam, loaded them, and prepared for the mile of stiff paddling up the Coboconk River to the north of the town. Canoe poles would have been desirable implements for that little stretch, but, not having them, we took our comfort from the knowledge that we would come back that way.

We had heard at Coboconk that there was a log drive in the Norland River, and, as we were anxious to make time on the outward-bound trip, we didn't waste much of it in the Little and Big Mud Turtle Lakes.

At the mouth of the Norland River, there is a peninsula about a mile in length, and it is much more convenient to portage across this strip of land than to indulge in a two-mile paddle around the point. At least, we thought so. Before doing so, however, we reconnoitered as to the navigability of the Norland River, and found that we could approach to within 100 yards of the falls. On the way up, we passed the log-driver's raft, and the ubiquitous alligator. Zack parleyed with the cook as he passed the raft, and exchanged three fine bass for three pies. Oh, those pies! What cast-iron stomachs log-drivers must have! Nevertheless, we negotiated them, and added the three tin

plates to our stock of culinary articles. I especially was thankful for these extra plates, as I never did take kindly to eating my dessert off an unwashed meat plate.

We landed at the foot of a steep bank on the right-hand side of the stream about 100 yards below the slide. To those unaccustomed to watching a drive of logs shooting a slide, there is something most fascinating about it. Above the slide, all is quiet and gentle, and the logs float lazily along toward the brink. They gather momentum down the incline, and then take their plunge into the noisy tumultuous water, often apparently turning a double somersault in their mad and frantic career. Small hope there'd be for any frail canoe that perchance was drawn down one of these slides, although some super-venturesome paddlers turn the trick once in a while, either voluntarily, or because, on their way down stream, they were too careless in approaching the brink of the slide, to make a safe landing.

If there's one thing that a log-driver prefers to his liquor or his cards, it is a chance to fool a canoeist. Inquiry on our part as to the probable duration of the drive developed the information that the stream would be clear in two hours, and yet not for three days. The time varied according to the informant. We finally learned from a farmer, who had just driven into town, that the end of the drive was about two miles upstream, and this information made us decide to portage.

For this purpose, we hired a hay wagon. The heavy stuff was loaded in the bottom of the wagon, and one of the canoes placed in the center on top of it. The two other canoes fitted nicely on the overhanging sides of the wagon, and all were securely bound and tied and paddled with one cushion and soft stuff.

[TO BE CONTINUED.]

### A. C. A. Membership.

The following have been proposed for membership to the A. C. A.:

C. A. Temple, Robert L. Manning, Albert W. Thompson, Remson Varick, J. B. McCrillis, Frederic S. Nutting, Harry C. Coulter, Edgar L. Martin and Mendon P. Moore, all of Manchester, N. H.; George C. Cheney, Dedham, Mass.; Clifton T. Mitchell, Philadelphia, Pa.; H. M. Morse and Fred B. Williams, Trenton, N. J.; Harry L'Hommedieu, Ray B. Kurtz, Conrad L. Baer, Raymond L. Watt, Frank T. Day, all of Buffalo, N. Y.; R. W. Allen, Kenosha, Wis.; J. G. Tyssowski, of Chicago, Ill.; William Becket Harding, of New York City.

### Fifteen-Footers from a Massachusetts Standpoint.

IN all the history of yachting, the distinctly small boat has never been so popular or so prominent as it is to-day. And by "small boat" I mean what is now understood by those words. Only a few years ago anything under forty feet waterline length was thought "small," but at the present time the average yachtsman of New England considers a 30-footer tremendously "shippy" and palatial.

The ever increasing length of overhangs has, of course, been one factor in the trend of the yachting world to smaller and smaller boats, for many a modern 30-footer has as much deck space as an old forty-five.

Another factor is the ever increasing cost of yachts. The man with but \$1,000 for a boat could once have obtained a 25-footer for that sum, but must now employ a cheap builder if he desires even an 18-footer.

Still another element in the growth of the wee classes, is the fact that young America is no longer content to learn in a rowboat with a sheet for a sail, but must have a craft essentially as "yachty" as that of his father. This is quite as it should be, for it develops pride in his boat.

Then, too, the fathers have found that there is as much sport and more independence in racing a small boat than a much larger one. It is certainly keener racing where one meets fifteen competitors than where one has but two or three antagonists, and this wealth of rivals is more surely to be found in the smaller classes.

The result has been that while the 21-footers furnished a good sized fleet, and the 18-footers the largest class in our history, the 15-footers are destined to eclipse everything in point of numbers, and probably in closeness of competition.

The 15-footers received their first great boom in

Crane 15-footer.

1895, when the first races for the Seawanhaka cup were held. Although technically known then as half-raters, they all approximated 15ft. length on the waterline, and the way they "caught on" was truly marvelous. The class seemed to spring up over night.

It is not the purpose of this article, nor does space permit me, to trace the cause of the speedy decline of the half-rater class. Suffice it to say that our clever designers, as is their wont, speedily murdered the class by demonstrating that under its rules, a perishable, shingle-shaped article and not a staunch boat, was the prize winner.

But brief as was the popularity of the half-rater, it was sufficient to sow good seed, since it demonstrated the practicability of sport in so diminutive a boat. The class was the direct forebear of the many one-design classes of 15-footers which have since then appeared upon our waters.

Nowadays, if one wishes to be assured of an appreciative audience, he has but to burst into abuse of one-design classes. Nearly all the yachting writers on both sides of the Atlantic, have their regular monthly slap at the idea.

But what if they are hard on the designers who did not get the order? And what if they do contribute little to the general advance of nautical science? If they furnish sport to a small army of men; if they produce boats where otherwise there would have been nothing but freaks; if they create more yachtsmen and better seamen; and (parenthetically), if they give the editors something on which to indulge their fine art of whole-souled denunciation, have not the one-design boats accomplished all that mortal can ask?

Take the "Water-Wags," a one-design class in Dublin Bay that has flourished for over twenty years, and is still very much alive; take the Newport thirties, or the Seawanhaka twenty-ones—what general measurement rule has produced better results?

Two great objections to one-design classes which have not been exploited by yachting critics (and which I mention here for their benefit), are the facts that most men want something a little different from everybody else's, and that (alas! that it should be so) where one is beaten because the other fellow is too clever for him he has to take it out on some one, and as he cannot lay it to his boat, he is apt to vent his feelings on his rivals (N. B.—By protests, bickerings and innuendoes.).

Perhaps you think I am straying from my subject. Perhaps I am—perhaps not. I know of one meritorious class of one-design 15-footers that was disrupted in precisely that fashion. I refer to the Crosby designed class at Hyannis Port, Mass. These were shoal draft, beamy, centerboard craft, with all the ballast inside. The most remarkable feature of this class was that all the boats were owned by the builder and chartered by him each season to the summer residents of Hyannis Port. It was a most progressive move on the part of the builder, and if it was not remunerative (which I believe it to have been) it was due to the jealousies

Herreshoff 15-footer Teaser.

The tides run very strong, and when going out against the S.W. wind cause a nasty, choppy sea. This is accentuated by the fact that the winds of that locality average much greater weight than those at Larchmont or Marblehead.

Mr. Herreshoff took these things into consideration in designing the class and produced a boat admirably adapted to the local conditions. The class has afforded the keenest of racing every year since its conception and is still popular. It has done much to develop the sport in that locality and to breed new and able sailor men. Despite their diminutive size, they have proved capable of journeying down to Padanarum and over to Vineyard Haven.

In point of numbers, the most prominent class of this size is that organized by members of the Seawanhaka Corinthian Y. C., and built in the winter of 1902-03, from the design of Mr. Clinton H. Crane. It was at first proposed to build a class under the rating rule, but it was feared that such boats would not be fast enough, so a one-design class was determined upon. In appearance the boats greatly resemble a 21ft. knockabout scaled down to 15ft. They are very handsome, and this aside from their careful construction and beautiful finish. They are double-planked, which seems unnecessary for such small boats, and built of the most expensive materials, which also seems a subject of regret, as they would be just as serviceable if less expensive, and would at the same time be more attractive to men with slender purses. However, as some twenty or more of them were built, this last objection may not be well founded. I understand that they cost \$650 each, exclusive of sails and fittings.

In design they are keel boats with more breadth than the Herreshoff boats, and less sail area, having but 290 sq. ft. in jib and mainsail. They are quite full forward and aft, with slack bilges and a moderate

of the putative owners rather than to any fault of his.

Hyannis Port is an ideal spot for a one-design class. As a yachting center it is semi-isolated. It is remote from any yacht racing association and the waters and winds of that locality have characteristics essentially their own. The boats that Mr. Crosby produced were admirably adapted to that vicinity, although they were undeniably homely and were a shade too beamy and flat for the prevalent seas of Nantucket Sound. Their overhangs, both forward and aft, showed a reverse curve at the L.W.L., and this gave a very peculiar shape to the transom. New York men who recall the Crosby half-rater of 1896, can get a good idea of this craft. Although designed as 15-footers, their extremely low overhangs soon settled until they measured 17ft. on the L.W.L., and they are now considered 17-footers. It is well to remember this fact and their beam of 8ft. in connection with their sail area of 388 sq. ft. They were over-canvased for everything save the lightest airs.

Their ballast was but 300 pounds, and was carried inside. It consisted of small stones and shale, which is a popular form of ballast on Cape Cod, as everyone who has ever seen a good old-fashioned Cape "Cat" knows. This ballast was of value principally for trimming purposes, as the boats depended for their stability almost entirely on their great beam and flat floor.

The boats started off with a schedule of two races per week, and much sport should have resulted. But

Herreshoff 15-footer Spider.

the wrong spirit prevailed, and when one skipper succeeded in winning several straight races, the others invented protest after protest and finally quit racing altogether in a fit of sulks.

The best known of the one-design 15ft. classes is probably that of the Beverly Y. C. Designed and built by Herreshoff, these boats have the appearance of being small editions of Columbia. Their bow overhang is long, strikingly high and fairly sharp. Although of the centerboard type, they are narrower than any of the other one-design class boats, having but 5ft. 10in. extreme breadth. Their draft of 2ft. 3in. is also less than any of the others save the Crosby boats.

Buzzard's Bay is rather more turbulent than any other sheet of water on the New England coast. The prevalent wind is S.W. and blows straight up the bay.

Mattapoisett 15-footer Spindrift.

amount of deadrise. The sections are saucer-like rather than U-shaped.

Last winter was a great one for classes of this kind, for in addition to that of the Seawanhaka Corinthian Y. C., others were formed from designs by Mr. W. Starling Burgess and Mr. William H. Hand, Jr. The former designed a class for the Mattapoisett Y. C. which had the avowed intention of trimming the Herreshoff boats of the Beverly Y. C. This was a pity, because the primary object of one-design classes is to produce an admirable boat irrespective of other craft. Eleven boats were built for this class, and the design showed much careful thought, although in my opinion it was not one particularly well adapted to Buzzard's Bay waters. They have 7ft. 6in. breadth or nearly 2ft. more than the Herreshoff boats, and just one-half their L.W.L. Their bilges are fairly hard and their floors flat. The sections showed a hollow garboard, which serves to reduce the wetted surface. Although of the centerboard type, they drew 3ft., or 9in. more than the Herreshoff boats and only 9in. less than the Crane keel boats. The added breadth and greater draft made them much more powerful than their Herreshoff rivals and enabled them to swing 350 sq. ft. of sail, when the Herreshoff boats were under double reefs. Under these conditions the boats proved to be fairly well matched (judging from such chance meetings as the two types had; there was never any regular match between representatives of the two designs). In light or moderate winds the boats of the Mattapoisett Club were unable to compete with those of the Beverly Club; while in a light air and a lop of a sea the latter could sail circles around the boats from Mattapoisett. The trouble was that the Mattapoisett boats were too powerful and too flat for the conditions with which they had ordinarily to cope. In a breeze they developed an excessive weather helm and became almost impossible to steer, even when still able to carry their sail. They were built rather heavier than the Herreshoff boats in every respect. As an instance of this their planking was  $\frac{3}{8}$ in. stuff, as against  $\frac{1}{2}$ in. planking of the Herreshoff boats. Their spars were also heavier—needlessly so—but this was probably a blessing rather than a detriment, since the added weight aloft would tend to give them a list in light airs when they most needed it, and in heavy weather they would be able to carry their sail so much longer than the other 15-

footers that the unnecessary weight aloft was not a harm, comparatively. It is to be noticed that these Burgess designed boats had considerably more sail than any of the other 15ft. ones, with the exception of that designed by Crosby. To my mind they were not as handsome as the Herreshoff, Crane, or Hand products. These Mattapoisett boats made an unusual record by sailing in forty races last season.

While it was not so announced, it is probable that Mr. Hand in designing a class for the New Bedford Y. C. also had it in mind to defeat the Herreshoff boats. His design, from which three boats were built, also

Crosby 15-footer Roolet.

went to more breadth and a flatter floor, more sail area, and less freeboard. He chose the keel type, but did not go to the extremes in dimensions that Mr. Burgess did, and his boats were as handsome little fellows as I have ever seen. The Hand and Crane boats are quite similar; but in almost every dimension, that of the former have a few more inches—to be exact, they have 5in. more over all length, 5in. more deck breadth, 6in. more waterline breadth, 100 pounds more ballast, and 26 sq. ft. more sail than the Crane craft.

In the few opportunities that arose for the Hand and Herreshoff boats to try conclusions, the former had rather the best of it.

The successes of all these classes and their marked popularity was undoubtedly a factor in the recent adoption by the Massachusetts Y. R. A. of a restricted 15ft. class. But it is to be regretted that the task of drawing up the restrictions was left to a man whose long identification with the old 21ft. cabin class and the new 22ft. class has influenced his mind in favor of a rather undesirable type of boat. This influence is shown in the restrictions devised by him. They are clearly calculated to produce a small 22-footer rather than a model similar to that of the Herreshoff, Crane or Hand boats. The new boats will be unduly wide, high-powered and over-canvased. It would seem as if in choosing the restrictions the very successful 18ft. knockabouts would have been followed for ideas rather than the 22-footers. But such was not the case. The sail area is but 75 sq. ft. less than that allowed the 18-footers. In fact it is the direct proportion that 15

Hand 15-footer.

is to 18. Can it be possible that this rule framer thought that sail area should vary directly as the waterline length? Such a theory would give a 90-footer but 2,250 sq. ft. of sail—18 is to 90 as 450 is to 2,250. It is to be noticed that 375 sq. ft. of sail area is 25 sq. ft. more than that allowed the Burgess 15ft. one-design class; 59 sq. ft. more than given Mr. Hand's boats, 55 sq. ft. more than the Herreshoff boats have and 95 sq. ft. more than the Crane boats swing.

Perhaps the most striking feature of these restrictions is the rule, "Boats having a draft of more than 2ft. 6in. without centerboard shall be considered keel boats." That either means that boats without centerboards are to be considered keel boats (which one would take to be the case without any rule to that effect), or else it means that centerboard boats draw

ing 2ft. 6in. with board up are keel boats. I suppose in time a rule will be made to the effect that sloops having bowsprits over a certain length shall be considered schooners.

The oft-repeated call for heavy scantlings has been heeded in these rules with a vengeance! The planking is to be the same thickness as with the 21ft. raceabouts. The frames are to be of the same material and of the same size as the 21ft. raceabouts, but are to be spaced nearer together. The deck clamps and bilge stringers are to be three-quarters the size of those on the raceabouts but must run from stem to stern, while on the raceabouts the bilge stringers ran only half that distance and their deck clamps were tapered at the ends.

Mattapoisett 15-footer Spindrift.

It does seem absurd for a 15-footer to have as heavy construction as a 21-footer, especially when the lighter construction of the Herreshoff 15-footers proved ample to meet the hammering received in Buzzard's Bay.

These new restrictions (calling for a minimum beam of 6ft. 6in. in keel, and 7ft. 6in. in centerboard boats) will produce very wide flat craft with beam carried well forward and aft, with deep, heavy transoms and blunt bows. They will be heavy and probably clumsy. It is hard to see how they can compare favorably in looks, seaworthiness or general adaptability with the Crane, Hand or Herreshoff models. The popularity they are sure to meet with would prove much greater were they more nearly in accordance with the splendid little craft turned out by those three designers.

Such features of these restrictions as those barring hollow keels, hollow spars, and double planking are a step in the right direction and much to be commended. The boats are sure to be able to carry their enormous sail spread owing to the generous beam imposed by the restrictions. The only question is whether it is well to have such high-powered craft when boats with less power and less sail have proven themselves equally fast in the average racing conditions, and also whether or not these wide flat boats are preferable to the handsomer types evolved by the Seawanhaka, Beverly and

New Bedford Y. Cs. These questions are ones that are best answered by the personal opinions of those who build for the new class.

Table of comparative dimensions of the different classes of 15-footers:

Designers ..Crosby.	Herreshoff.	Burgess.	Crane.	Hand.

## Yokohama Y. C.

BY A. R. CATTO, YOKOHAMA Y. C.

EARLY in the history of the foreign settlement in Yokohama there were occasional sailing races among the boats of the ships lying in the port, and as boats were acquired by the residents the sport grew in popularity. For many years the fleet consisted of open boats, old converted ships' lifeboats, etc., but as time went on craft were specially built for the purpose, and during the season of 1886 races were held regularly and so much enthusiasm was shown that it was felt that the sport required the establishment of a properly organized yacht club. At the outset there was some difficulty, as the Rowing Club, to which most of the boat owners belonged, wished to take the matter in hand. The Rowing Club had a pavilion and landing stage, which they represented as being indispensable to the owners of the sailing boats, but the latter felt that it would be better to have their own organization, and decided to form a separate club, even if they had only the wide, wide sea as their club house. The Yokohama Sailing Club was therefore formed, and commenced the season of 1887 with about 24 sail on their register. Of these, five were specially built yachts, decked and ballasted, five were open or half-decked, one was built on the model of a Japanese fishing boat, and the remainder were converted ships' boats. The champion for the season of 1886 is still on the club register, and still races occasionally in handicaps.

The succeeding four years saw a large number of new boats built. One built in 1888 from lines supplied by the late Edward Burgess, with a water-line length of 31ft., and sail area of about 1,900sq.ft., is still well to the front in her class, and in her own particular weather picks up an occasional prize. A few yachts have been imported from the Solent, the Clyde and New York, but the majority have been built from lines by local designers, and these are by far the most successful.

A canoe class was started in 1889, and flourished for some years until the addition of heavily weighted keels to some of the boats brought the type into disfavor. A Surbiton gig class started in 1890 then reigned in favor among the younger owners, and with modifications the type lasted until 1902.

In the year 1897 the name of the club was changed to the Yokohama Y. C., as the proportion of real "yachts," as opposed to "sail boats," certainly justified the name. The club register for this year included 30 yachts; the old converted ships' boats having been all superseded. From about this time a very useful class of raceabouts has gradually developed into one of the best for close racing in the club. With a water-line length of from 18 to 21ft., and sail area about 450sq.ft., they are very handy craft for racing and day sailing. Last year a one-design class was started, 15 boats being built to the lines of the Lark. These small racers sailed 24 races during the season, and afforded most excellent sport, proving quite the best class from a purely sporting point of view that has ever been introduced in these waters.

The Club Register for 1903 contained 17 cabin yachts, headed by the flagship of the Commodore, a schooner of 37 tons register, and an auxiliary schooner, a cruiser. The first division consisting of boats of from 10 to 14 tons displacement, was unfortunate during the season, as one yacht was wrecked during a gale and broken up, and another was taken away from Yokohama on the departure of the owner from Japan. The second division, cabin yachts forming the cruising class, afford very good sport racing under handicaps. Ten raceabouts and fifteen Larks complete the number on the register. In 1903, during the season from May to October, 62 races were sailed. The rating formula is the cube root of load waterline multiplied by sail area, but as the types of yachts are so varied, a fair proportion of races are

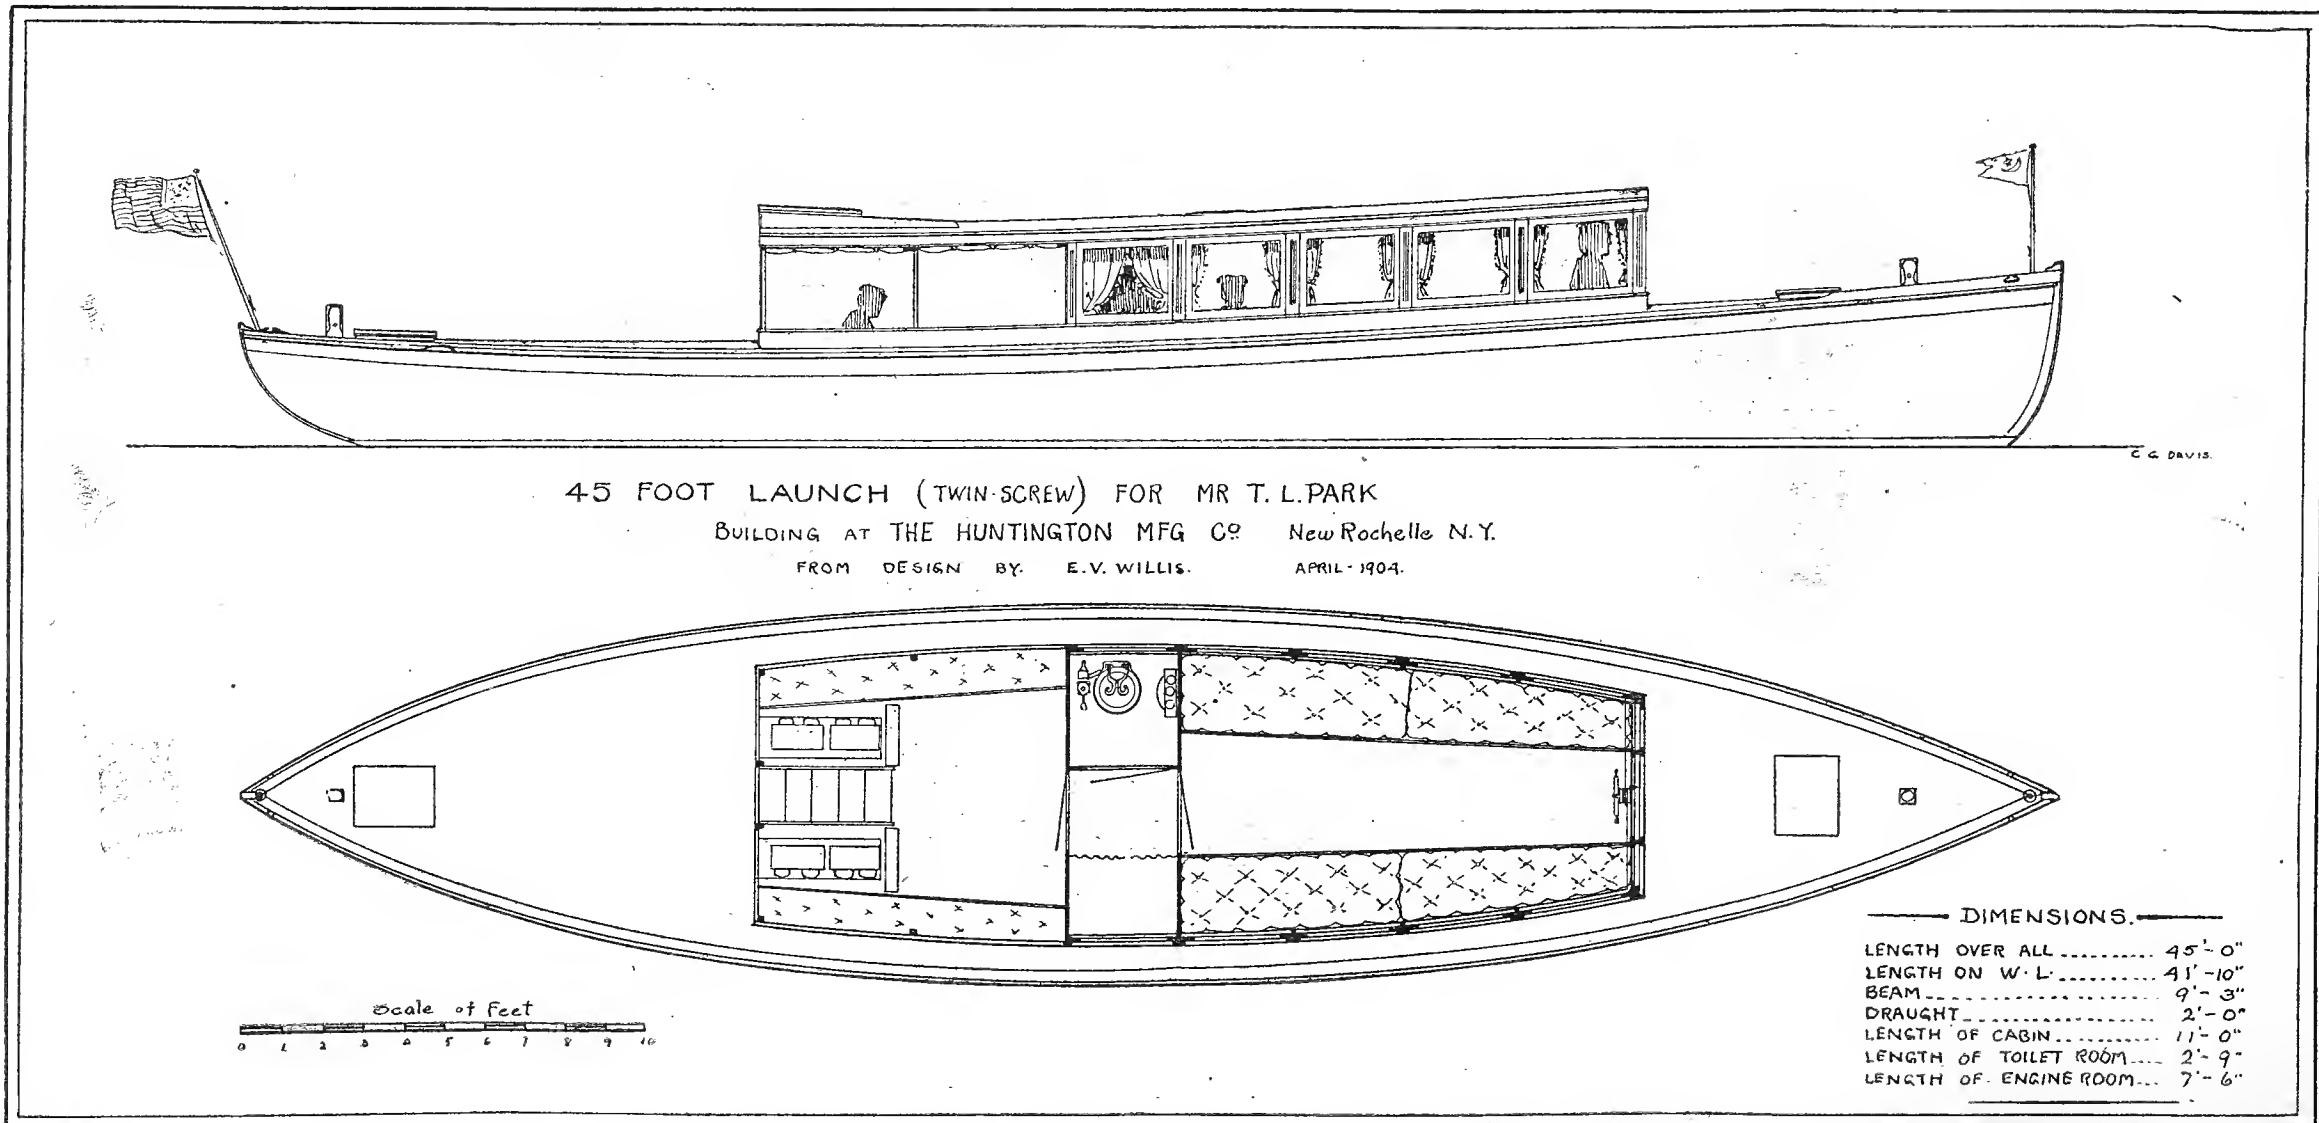

Crane 15-footer.

sailed under handicaps, except, of course, races for the Lark class.

From its situation on the Gulf of Yedo, Yokohama is admirably suited for the headquarters of a yacht club. The harbor is well protected by a breakwater, and the part assigned by the authorities for the yacht anchorage is next to the Bund, with a depth of from 2 to 3½ fathoms. The average rise and fall of tide is about 6ft. The Gulf of Yedo extends some 40 miles by 20, and affords excellent cruising and racing water, especially to the west and south, where it opens to the Pacific by a channel about 6 miles wide. Outside there is splendid scope for coastwise cruising, with numerous snug harbors at convenient intervals. Off the coast lies Vries Island, which forms an objective for more ambitious voyages, and has been visited by several of the larger yachts, as excellent woodcock shooting is to be got there.

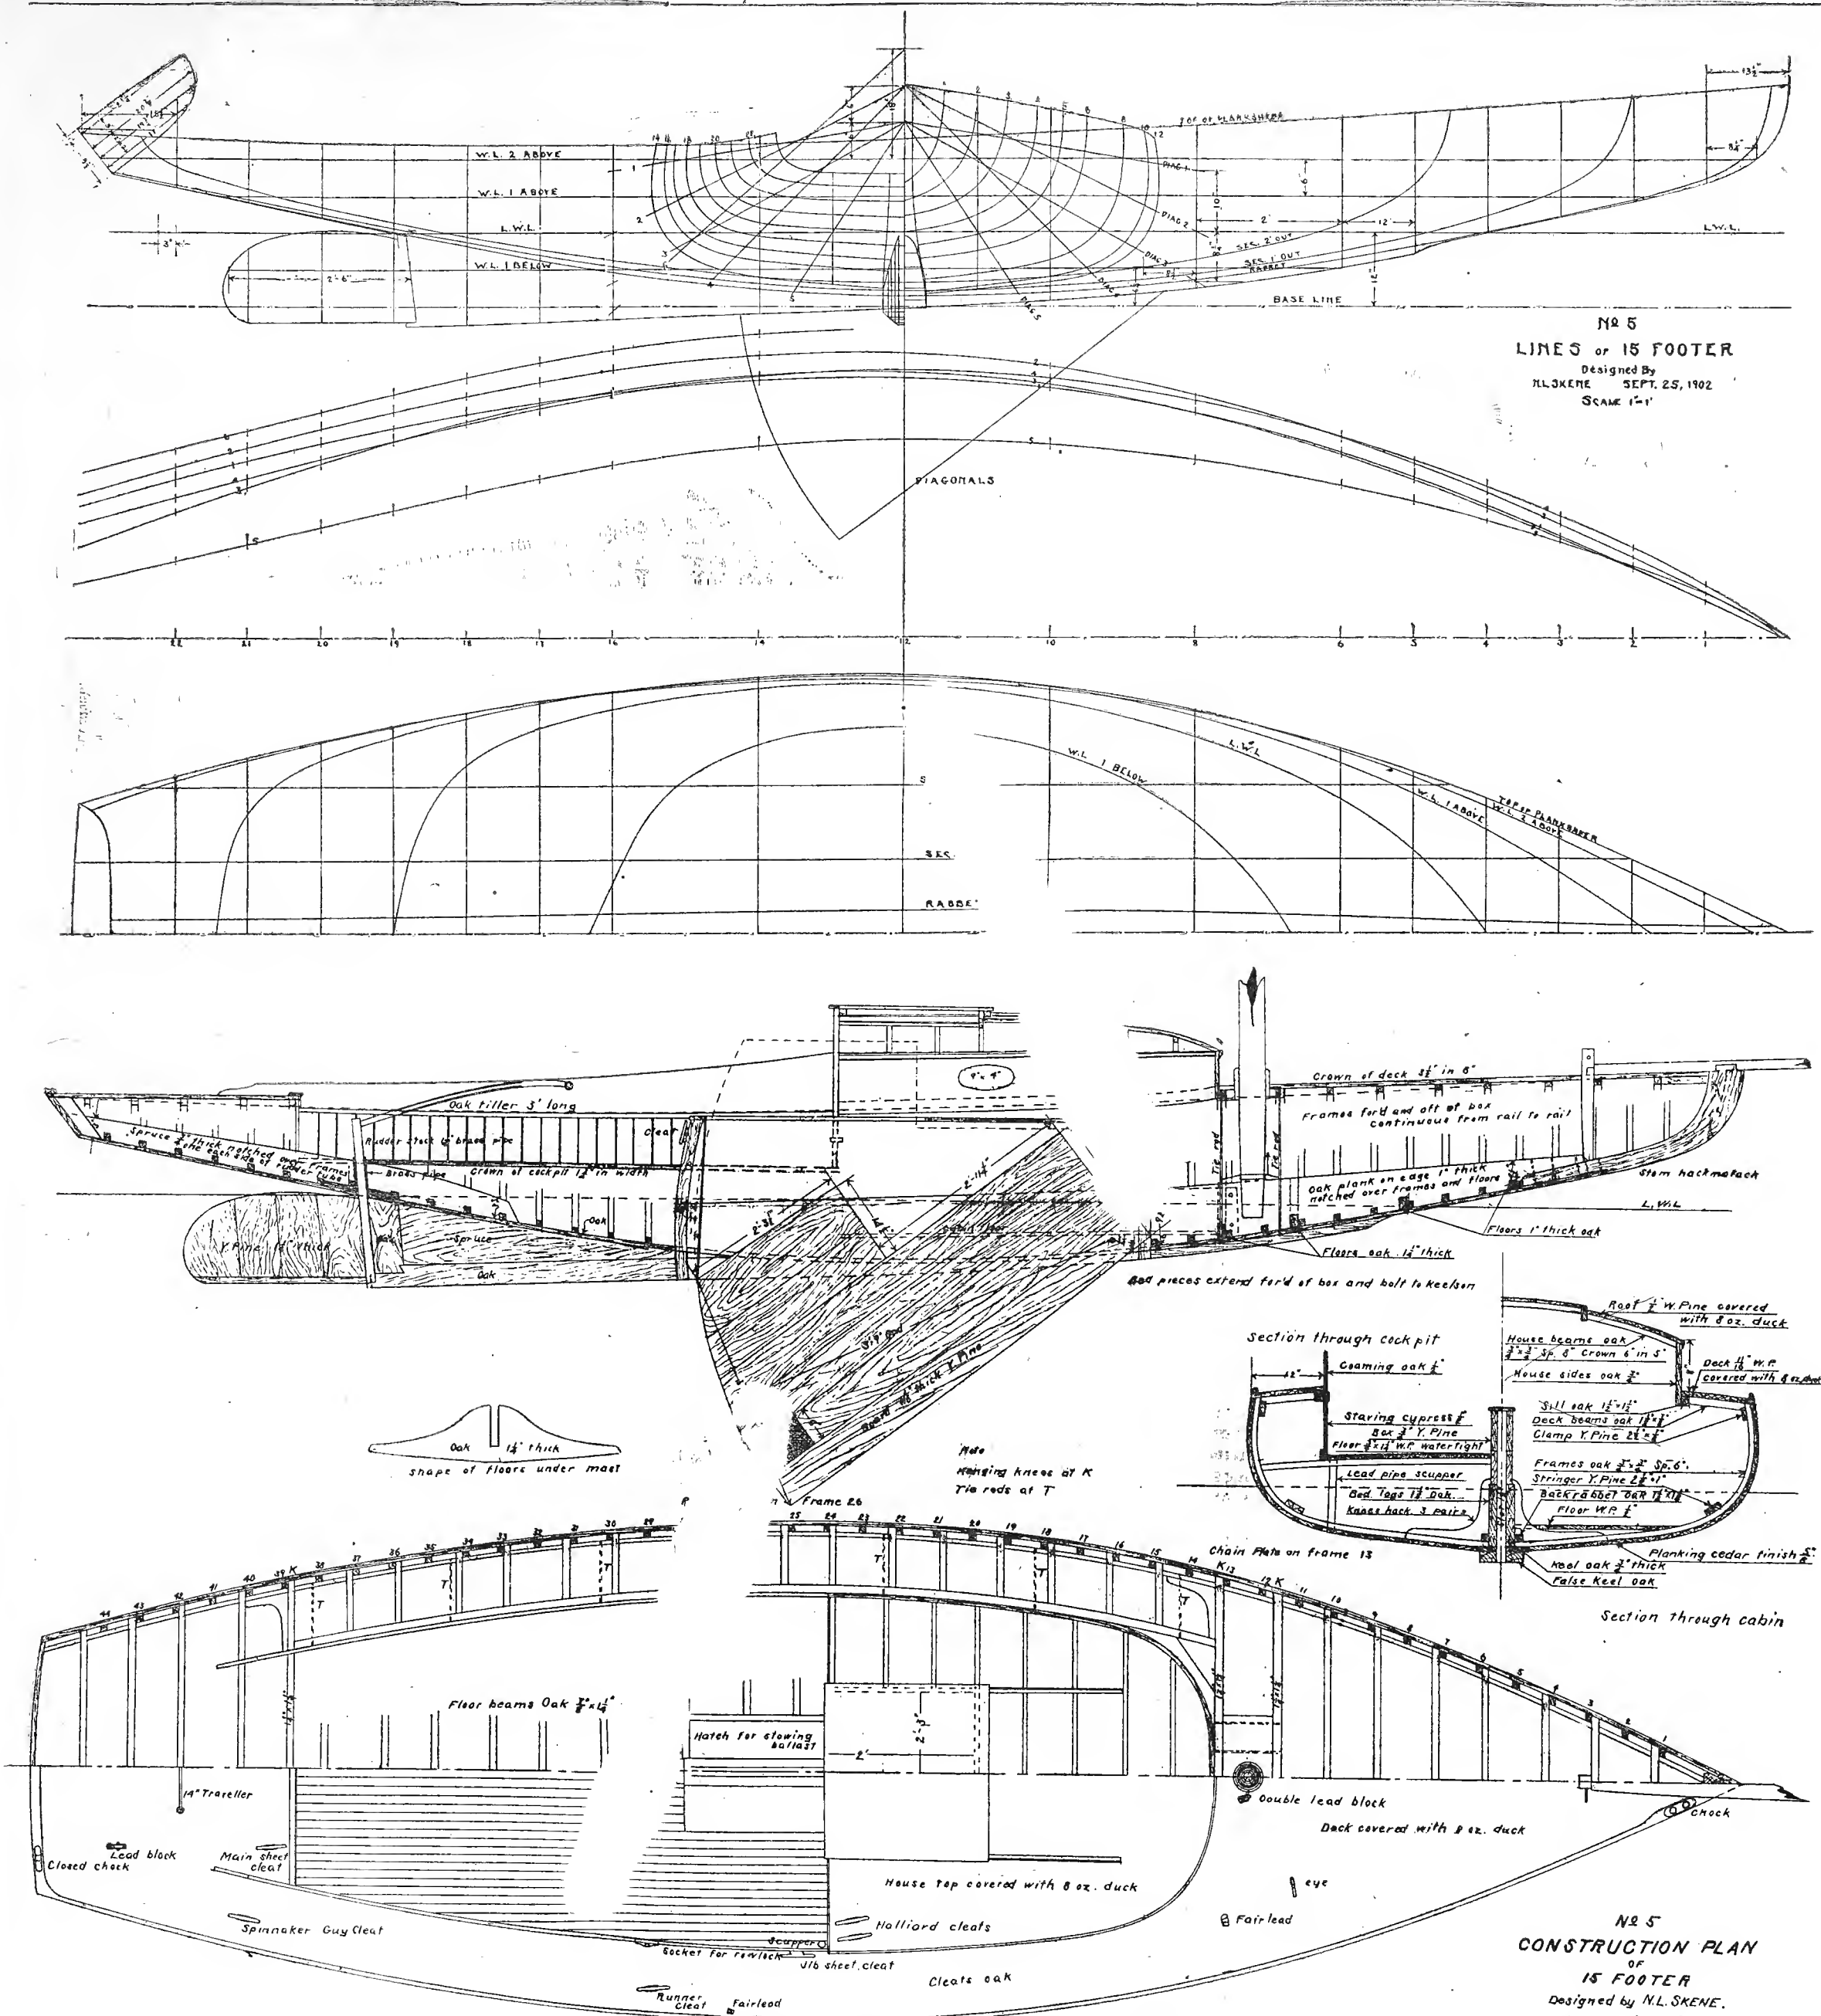

Japanese make very good yacht hands, as they are born sailors. They take a very keen interest in racing, and at the close of every season there is a race for the small boats, manned by native paid hands only. This event is always productive of great excitement, and there is usually some carrying away of gear among the competing boats.

In and about Yokohama there are some excellent

OUTBOARD PROFILE, DECK AND CABIN PLANS OF 45FT. LAUNCH—DESIGNED BY E. V. WILLIS FOR TRENOR L. PARK.

LINES AND CONSTRUCTION ULAN OF 15-FOOTER—DESIGNED BY NORMAN L. SKENE FOR PROF. JOHN. W. PILLSBURY.

Japanese shipwrights, who turn out very good work, and the cost of construction is low. One of the most prominent members of the Yacht Club, a gentleman who has done a great deal for the good of the sport, and a very successful designer, has in connection with his business a staff of sailmakers. Yacht sails supplied from his loft have been pronounced by good judges to be equal to anything obtainable in America. Altogether the expenses of yachting in Yokohama are lower than almost anywhere else in the world, anyone with a taste for the sport can indulge in it to the top of his bent.

### Design for a 45ft. Launch

WE publish herewith the outboard profile, cabin and deck plans of the 45ft. launch building by the Huntington Manufacturing Co., of New Rochelle, for Mr. Trenor L. Park. The boat was designed by Capt. E. V. Willis, Mr. Park's sailing master. She will be used for towing Mimosa I. and Mimosa II., Mr. Park's two racing boats, to and from the different Sound regattas. Her dimensions are as follows: 45ft. over all, 41ft. 10in. waterline, 9ft. 3in. breadth, and 2ft. draft.

She has an oak frame keel, keelson, stem and stern, cedar planking put on with brass screws. Her top strake and all fore and aft members such as clamps and shelves, are yellow pine. Topstrake also yellow pine in one length.

She will be equipped with 70 horsepower, made up of two 35 horsepower auto motors, manufactured by the Matheson Motor Car Co., Ltd., of Holyoke, Mass.

### Design for a Fifteen Footer.

In this issue there appear plans of a centerboard 15-footer. She is a jib and mainsail boat of a serviceable and handy type. The boat was designed by Mr. Norman L. Skene for Prof. John W. Pillsbury, of Waban, Mass., for use at Chatham on Cape Cod.

Her dimensions are as follows:

Length—	Over all	23ft.	6 in.
	L. W. L.	15ft.	
Overhang—	Forward	4ft.	1½in.
	Aft	4ft.	4½in.
Breadth—	Extreme	7ft.	
	L. W. L.	6ft.	8 in.
Draft—	Extreme	1ft.	3½in.
	To rabbet		10 in.
	Board down	4ft.	3 in.
Freeboard—	Forward	2ft.	

Least .....	1ft.	2½in.
Aft .....	1ft.	4½in.
Sail area—		
Mainsail .....	267	
Jib .....	58	
Total .....	325sq.	ft.
Cockpit, length .....	7ft.	6in.
Cabin, length .....	6ft.	6in.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

**BROOKLYN Y. C. TO MANAGE OUTSIDE RACE.**—The outside race for small boats that was exploited by Mr. Thomas Fleming Day is now in the hands of the Brooklyn Y. C., which club will manage the contest. The race will take place late in June or early in July. The start will be made from Gravesend Bay, and not from Sandy Hook, as was originally intended. After leaving Sandy Hook the race will be outside all the way. The distance is over 320 miles. It is believed that there will be at least ten or twelve starters.

SCHOONER ELFIN SOLD.—Mr. Paul R. Bonner has sold his schooner yacht Elfin, through the agency of Mr. A. J. McIntosh, to Mr. Freeland Jones.

## Designing Competition Awards.

Editor Forest and Stream:

Your paper is to be congratulated on the splendid results of the designing competition offered by you last autumn. No less than twenty-seven sets of plans of 40-footers having been sent in to compete for the three prizes, and the cabin or arrangement prize.

The designs have been marked according to the following table, and I think your readers will be interested in the system employed:

	Model.	Construction.	Arrangement.	Style.	Rig.	Specifications.	Total.
Possible mark:	10	10	10	10	5	5	50
Lanyard.....	7	8	8	8	4	3	38
Buster Brown.....	6	5	9	7	3	3	33
Weather Helm.....	5	8	6	5	3	3	30

First prize, Lanyard; second and cabin prize, Buster Brown; third prize, Weather Helm.

The first prize, of one hundred dollars, goes to Lanyard, Mr. Charles D. Mower, of New York City, whose plan received a total of thirty-eight marks in a possible fifty. The second prize, of sixty dollars, goes to Buster Brown, Mr. Harold W. Patterson of Yonkers, N. Y., who receives thirty-three points. The third prize, of forty dollars, goes to Weather Helm, Mr. A. E. Luders, New York City, with thirty points.

The prize of twenty-five dollars offered by Mr. T. C. Zerega, for the best interior plan, has been awarded to Buster Brown, Mr. Harold W. Patterson, who is marked nine points out of a possible ten in the column headed arrangement.

The various points to be considered have been divided into six heads: Model, construction, arrangement, style, rig and specifications. As marks on these points were considered to cover the requirements of the competition under the first four headings, 10 was taken as a possible score, and under the other two, 5, as these were considered to be more or less stereotyped by custom, and, therefore, less latitude could be taken by the competitors.

Lanyard, Mr. Chas. D. Mower, presents a very handsome and well thought out design, which has received a high mark in all requirements. The model is fair and easy, the construction good, arrangement fair, good fore-castle, galley and cabin, and some very novel features of entrance and after cabin. The deck plan is novel and looks very comfortable. The companionway on one side is an interesting feature. Mr. Mower gives an excellent general description with his specifications, which I hope you will find space to print.

The second prize of sixty dollars has been awarded to Buster Brown, Mr. Harold W. Patterson, who has sent a very handsome design, very well thought out. The construction is somewhat different from Lanyard, as the frames are all bent. His cabin arrangement has received the highest mark of all the designs, and the "Cabin Prize" has been awarded to him. The features of the cabin plan are a good fore-castle where the crew will be contented and stay throughout the commission, a comfortable stateroom for the owner, with good toilet room opposite, hall arranged cabin and an entrance separate from the cabin where a man may shed his wet things when going below in the rain, and where charts may be consulted. This boat presented the most comfortable plan of the twenty-seven, but I am not sure that the last word has yet been said upon the arrangement of the room in a 40-footer. An excellent description accompanies this set of plans.

The third prize of forty dollars goes to Weather Helm, Mr. A. E. Luders, who presents a boat of good model and of excellent construction. Style, rig, and specifications, fair. The cabin plan from the companionway to the forward end of cabin is perfect, but forward of that point there is too much attempted. The galley lacks headroom except under a small skylight, and the stateroom and captain's room crowd each other uncomfortably. A captain's room on a 40-footer is of doubtful utility, as the owner is supposed in this size boat to be able to accept the responsibility of command.

CLINTON H. CRANE.

## St. Paul Letter.

ST. PAUL, March 30.—The annual meeting of the White Bear Yacht Club was held March 9, in St. Paul. There was a large attendance, and the officers for 1904 were elected. As this year will be a red-letter year for the White Bear Yacht Club, especial attention was paid to selection of the new officers, all of them being men in whom the club members feel the utmost confidence. J. P. Elmer was unanimously chosen commodore, W. C. Reed was elected vice-commodore, G. W. Rodenberg was re-elected secretary, and W. B. Geery was for the second time given the office of treasurer. Henry Van Vleck will hold the office of captain.

The executive committee is as follows: H. P. Clark, L. P. Ordway, T. G. Wann and C. M. Griggs. The regatta committee will consist of William Rees, Dr. C. M. Owens, Dr. J. M. Welch and Henry Merrill.

Although there are numerous trophies and pennants for each of the different classes of boats on White Bear the interest for the coming season is centered in the coming race with the Royal St. Lawrence Y. C. for the Seawanhaka cup on Lake St. Louis. There will also be much interest shown in the selection of two boats for the regular Inland Lake Y. A. meeting, which will be held at Oshkosh or Lake Winnebago in the latter part of August.

There will be a large class of small boats, known as "B" boats, and as most of these are owned by the sons of the regular members a great deal of sport is expected. Johnson, of White Bear, is building fifteen of these boats, all the same model, five of which remain on White Bear and the rest go to Spring Lake. These yachts are almost the same model as the Massasoit, which was a contestant in the Bridgeport trial races to select a challenger for the Seawanhaka cup in 1902. Gus Amundson has finished three "B" class boats, of somewhat the same model as his last year's winner of the "B" class at Oshkosh.

Both Johnson and Amundson have started to work on the new Seawanhaka challengers, and the third, which is built by Jones & Laborde, of Oshkosh, has already been finished. It was at first proposed to build four boats, and it was in the FOREST AND STREAM to that effect, but the committee has since changed its mind, and now there

SAIL PLAN OF 15-FOOTER DESIGNED BY NORMAN L. SKENE FOR PROF. JOHN W. PILLSBURY.

are only going to be three. The first trials will be held June 13, and after the fastest boats have been found, they will be raced at Oshkosh under conditions quite similar to those at Lake St. Louis, Montreal.

Bald Eagle is a small lake not far from White Bear, and although there has only been sailing there for four years, the Yacht Club has made rapid strides. The members are nearly all young men, and are very enthusiastic over the sport. A new class has been added to the fleet; this class is very similar to the old "seventeen-foot" class of the White Bear Y. C. There are ten boats, all of the same model, being scows and twenty-five feet over all. The club will have a new club house, which will not be expensive in style and furnishing, being built more for comfort.

The officers elected at a recent annual meeting are: Z. H. Thomas, Commodore; Charles H. Hart, Vice-Commodore; A. Geisberg, Secretary; J. A. Mull, Treasurer; A. Holterhoff, Captain. The sailing committee consists of R. B. Hall and I. E. Sifveland.

The Lake Minnetonka Boat Club was incorporated Tuesday, March 29. The membership fee is \$10 annually. The officers are Carl Puckett, Commodore; Roy H. Wagner, Vice-Commodore; T. E. Hawkins, Secretary; and F. B. Zahn, Treasurer. J. G. ORDWAY.

## British Letter.

THE French paper, Yachting Gazette, for March 18, is a nicely got up, well illustrated number, full of good photographs of the yachts and motor launches taking part in the racing at Marseilles, Cannes, Nice and Monaco, but to Britishers the Riviera regattas this year are of little interest, and the chief contests are between French and Italian yachts. The most important event from a sporting point of view will be the races for the Coupe de France at Nice, on April 2, 4 and 5. This trophy was won by Mr. Harrison Lambert's 20-rater, Gloria, in 1898, the defending boat, Esterel, being distinctly unlucky in losing. The cup was successfully defended by the Royal Temple Y. C.; Mr. E. Hore's Payne-designed Laura beating the Duc Decazes' Anna on the Solent in 1899, and once more successfully defended it against the same owner's Quand-Même I, at Ramsgate the following year. In 1901 the Royal Temple Y. C. enlisted the services of Fife's invincible 52-footer, Magdalen, to oppose a third challenge by the Duc Decazes with a new Quand-Même. Unfortunately, a short time before the races were fixed to take place, it was discovered that Magdalen was over 20 tons, French measurement, and as her owner, Baron de Forest, refused to allow her to be altered to suit the rule, the cup had to be returned to France.

Magdalen and Quand-Même II had a private match at Weymouth, the best out of three races, in which the Scotch boat won the first two in a most decisive manner, thus rendering a third contest unnecessary. Before the end of 1901 the Duke of the Abruzzi challenged on behalf of the Regio Yacht Club Italiano, and the size of the competing boats was reduced from 20 to 10 tons. The Italian-built Artica scored a very lucky win over the French boat Suzette in 1902, but the following year the cup went back to France, Suzette getting her revenge for the defeat of the previous year. This year the French boat is a new one, and the challenging boat is Sally, the property of

Chevalier Coltelletti. Sally is one of the three boats built last year with the view to defending the cup, though she was not then chosen.

The glories of the Riviera regattas, however, seem to have departed for the time. During the closing years of last century there were always some of the big English cutters present at the chief regattas and splendid races were organized for them. Many stirring matches were sailed when Britannia, Satanita, Ailsa and other such heavy weights hoisted colors in the blue waters of the Mediterranean, but since Sybarita and Kariad sailed a series of one-sided races out there two years ago no big vessels of note have graced the Riviera. There has, however, been a great increase in motor boats, and the small raters keep up their numbers. Of course, the absence of big British racers is easily accounted for, because there are none fitted out for English racing.

Col. Bucknill, well known in Solent yachting circles, and more widely so as a writer under the pseudonym of Thalassa, has been elected captain of the Solent One-Design Class for 1904. Col. Bucknill was one of the principal starters of the class in 1896, and was its first captain. The class is still going strong, and Mr. H. Maryetti, who owned and raced the old Richardson cutter Irex, the last three seasons in the big handicap class, is building a boat for the Solent One-Design Class. There will be at least a dozen of these little craft afloat this year.

E. H. KELLY.

## Boston Letter.

BOSTON, April 4.—The work of fitting out has commenced at the various yards, and, in some instances, yachts are to be found at their moorings. These cases are rare, however, for the fitting out season has been the most backward in several years. Generally, at this time, there are scores of yachts with running rigging in place, sails bent on their sides glistening with fresh paint, ready to take their dips as soon as there have been two or three days of warm weather. The warm days had not arrived up to last Sunday, however, and so little or nothing has been done. In other years many amateur yachtsmen could be found working on their boats during the first days of April, but this year there are very few yachts that have had their winter coverings removed.

Mr. Lawrence F. Percival's 35ft. speed launch has been launched at the Marblehead Yacht Yard, and she was given a trial last Saturday. She did not develop the speed that was desired. It was discovered that the shaft strut had pulled off and spoiled the lead of the screw. As soon as this has been fixed she will be given another trial, when it is expected that she will develop all the speed that was intended.

The second general meeting of the Eastern Y. C. for 1904 will be held at the St. Botolph Club, Tuesday evening, at 8:30. At this meeting the advisability of purchasing the wharf at Marblehead, now used as a club landing station, will be discussed. This property is one of two parcels, in which ownership was hotly contested by residents of Marblehead recently. The other parcel is owned by the Boston Y. C. The Marblehead residents claim that each of these wharves had been used as public thoroughfares for a number of years, and that the yacht clubs had no right to inclose

them and bar out the public. It was decided by the courts that the clubs could do what they pleased in the matter of building fences around the properties. The wharf now used by the Eastern Y. C. was purchased by Mr. Frank B. McQuesten, and it was generally understood at the time that it would eventually be owned by the Eastern Y. C. As a landing place it has proven of great value to members of the club.

At Lawley's the 102ft. waterline steam yacht, designed by Mr. Arthur Binney for Mr. Chauncey B. Borland, is nearly ready to take the water. This yacht is similar to the Monaloe, also designed by Mr. Binney for Mr. Borland, with the exception that she is longer. The steel steam yacht, designed by Mr. Fred D. Lawley, for Mr. Paul Rainey, is receiving the finishing touches, and the 99ft. steam yacht, designed by Swazey, Raymond & Page, is practically ready for the water. Mr. S. C. Winsor's 22-footer, Warrior, designed by Fred D. Lawley, is well along. This boat is very flat and has as much of the scow principle as the restrictions governing the class would allow Mr. Lawley to go. The 15-footer for Mr. H. H. Wiggin is about completed.

Another fast auto boat has been heard from. The order for this boat has been given to Messrs. Burgess & Packard, by Mr. H. L. Bowden, the well-known automobilist. She will be fitted with a French motor of 50 horse-power, and is expected to be about the fastest thing of her kind in Massachusetts waters. The designers do not wish to announce any further particulars concerning her dimensions, etc., just at present. The same designers have orders for a 26ft. auxiliary cruising yawl for Mr. A. Lawrence Lowell, a keel 15-footer for Dr. Morton Prince, and a keel 18-footer for Hon. W. Caleb Loring.

Small Bros. have an order for a 21-footer to race for the Lipton cup at Chicago. This boat will be built at Lawley's, and will be planked with mahogany. The owner's name will not be announced for some time. They also have an order for a Y. R. A. 15-footer for Mr. H. Lunberg, of the Dorchester Y. C., and a 20ft. cat for Mr. C. H. Kelley, of Winthrop. The 21ft. ketch of their design for Mr. R. R. McCormick, of Coconut Grove, Fla., is being built by Mr. Hugh Bishop, of Gloucester, and the mahogany launch for Mr. H. W. Hornthal, of Norfolk, Va., is being built by Messrs. Sterns & McKay, at the Marblehead Yacht Yard.

At the South Boston Y. C., Thursday, there will be a testimonial hop, tendered to Messrs. P. J. McMahon and William X. McKee for their excellent work on the last anniversary ball committee. The second general meeting of the club for the year will be held on Wednesday evening.

The New Bedford Y. C. has elected Frank H. Murkland, Measurer, and W. H. Hand, Jr., J. G. Baker, W. S. Bourne, W. E. Smith and F. W. Reynolds, Regatta Committee. The club will cruise to Onset Bay on June 25, and to Newport July 2, 3, and 4. There will be a cruise to Marion in August, and a cruise September 3, 4, and 5.

Mr. E. A. Boardman has an order for an 18-footer, for a yachtsman who wishes his name withheld for the present. He has also sold an 18-footer for the same yachtsman.

The houses at the City Point and Marblehead stations of the Boston Y. C. were opened for the season, April 1. Floats have been put in position at both stations for the early yachtsmen. JOHN B. KILLEEN.

## Rifle Range and Gallery.

### The New York Corps.

At the monthly meeting of the New York Schuetzen Corps, No. 69 St. Mark's Place, April 7, the winners in the corps' winter gallery contest received their prizes. Capt. John H. Hainhorst, assisted by the members of the shooting committee, Messrs. F. Facompre, B. Zettler, Chas. Munn, A. W. Lemcke and Chris. Konig, distributed them to the eighty-three members who shot through the winter programme. The shoot was opened in November with eighty-six entries. The prizes consisted of silver and bronze works of art, and other articles useful in the home. The winners, in the order of their standing, follow:

Bullseye target, 4in. carton, the best ten centers: H. D. Meyer 22½ degrees, Geo. Ludwig 24½, C. Brinckama 25½, F. Schultz 26½, J. N. F. Seibs 27, H. Nordbruch 27, L. C. Hagenah 30, H. Meyn 31, P. Heidelberg 32, R. Gute 32½.

Five best bulls for the special diamond medal, one prize: J. N. F. Seibs.

Ring target, most points, ten prizes: Otto Schwanemann 4713, J. C. Bonn 4607, H. Haase 4567, Geo. Offermann 4530, G. Thomas 4526, H. Beckmann 4461, C. Schmitz 4442, A. W. Lemcke 4440, Wm. Schultz 4407, N. C. L. Beversten 4398.

Winners for best bullseye for the balance of the prizes: Wm. Dohl, C. Roffman, D. von der Lieth, G. J. Voss, J. Paradies, H. Winters, F. Facompre, D. H. Brinckmann, H. C. Hainhorst, John H. Meyer, J. Facklam, D. Pepper, J. H. Hainhorst, H. R. Caplan, H. Horenberger, J. Jantzen, Geo. Junge, J. C. Kruse, C. Mann, A. Evers, J. Gobber, H. Offermann, Herman Koster, C. Konig, F. Feldhusen, R. Ohms, F. Dierks, M. J. Then, H. Lohden, N. W. Haaren, A. Beckmann, H. Rottger, D. von Glahn, F. Lankenau, C. Wahman, J. H. Doscher, J. C. Degenhard, M. von Dwingel, H. B. Michaelsen, B. Kumm, J. G. Tholke, H. Koster, H. Konig, Aug. Beckmann, D. Ficken, Wm. Schaeffer, Herman Heinecke, H. Quinten, H. Haaren, Gus Hagenah, D. von Hein, H. Leopold, J. H. Grote, J. C. Brinckmann, John May, H. Decker, A. Giebelhaus, L. Goldstein, H. Gobber, Aug. Ledhaus, D. Dede, N. Jantzen, B. Zettler.

### Zettler Rifle Club.

At the weekly gallery shoot of the famous Zettler Club good scores were the order. Capt. W. A. Tewes gave a fine exhibition in his 100 shots. He made three scores of 248. His total, 2462, was a grand score. L. P. Hansen shot in good form, and got a total of 2448. Veteran Louis Maurer made one score of 247.

Ten-shot scores, 25-ring target, distance 75ft., offhand, 100 shots: W. A. Tewes 2462, L. P. Hansen 2448, A. Moser 2412, Aug. Begerow 2367.

Fifty shots: W. A. Hicks 1206, Aug. Kronsberg 1205, C. Zettler, Jr., 1201, C. Zettler, Sr., 1199, L. Maurer 1204, H. C. Zettler 1187, B. Zettler 1183, Major A. Rowland 1182, Geo. J. Bernius 1173.

### New York City Corps.

NINE members of the New York City Corps shot in the regular contest, Zettler's gallery, on March 31. Aug. Kronsberg was first and Capt. R. Busse second. Ten-shot scores, 25-ring target, distance 75ft.: Aug. Kronsberg 242, 246; R. Busse 242, 243; O. Schwanemann 236, 240; John Wagner 239, 228; R. Schwanemann 231, 235; Jos. Keller 211, 221; H. R. Caplan 205, 213; G. Schrotter 204, 205; A. Wiltz 186, 208.

### Italian Rifle Club.

At the Italian Club shoot, Zettler ranges, March 28, E. Minervini was first with the score of 244. P. Selvaggi second with 242.

Ten-shot scores, 25-ring target, distance 75ft., offhand: Minervini 244, Selvaggi 242, Conti 237, Gerbolini 237, Bianchi 236, Borroni 232, Rossotti 226, A. Orsenigo 226, E. Orsenigo 225, Personeni 225, Reali 226, Ciancinio 214, Corbyoni 193.

### Rifle Notes.

The Miller Rifle and Pistol Club left its old home at 423 Washington street, Hoboken, N. J., and located at No. 107 Washington street. The club's new headquarters has three ranges 75ft. long, with all the modern improvements.

Great improvements are now being made in the Union Hill Schuetzen Park in order to get it in shape for the great festival in June. When finished, there will be thirty-two targets open for the great body of riflemen who are coming from all parts of America to take part in the contest.

The target of honor (Columbia) and the Stich target will carry probably \$15,000 or more. The other targets will increase the total prize list to \$25,000.

There will be a formal opening of the rifle shooting season in the Union Hill Schuetzen Park, May 4. The programme provides team and prize shooting.

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

### Fixtures.

April 6.—Sheepshead Bay, L. I.—Eastern amateur target championship, on grounds of Sheepshead Bay, L. I., Gun Club.  
April 6.—Parkersburg, W. Va.—Ohio Valley Shooting Association Spring tournament.  
April 6-7.—Bristol, Tenn.—The Interstate Association's tournament, under the auspices of the Bristol Gun Club. S. W. Rhea, Sec'y.  
April 7.—Bethlehem, Pa.—Lehigh Rod and Gun Club of the Bethlehem all-day target tournament. H. F. Koch, Sec'y.  
April 12-13.—Indianapolis, Ind.—Indiana League of Trapshooters' annual tournament.  
April 16.—Bound Brook, N. J., Gun Club all day target shoot; free silver prizes. Dr. J. B. Pardoe, Sec'y.  
April 18-22.—Kansas City, Mo.—J. F. Schmelzer & Son's Arms Co. fourth Interstate midwinter shooting tournament; targets and live birds.  
April 19.—Springfield, Mass.—Shooting Club Patriots' Day tournament. C. L. Kites, Sec'y.

## DRIVERS AND TWISTERS.

In the Good Friday shoot at Holmesburg Junction, Pa., last week, a handicap at 25 birds, \$10 entrance, Harvey, at 28yds., won first money on a straight score of 25.

In the monthly shoot of the Freeport, L. I., Gun Club gold medal event, April 2, Messrs. E. P. Smith and L. W. Valentine tied, and, in the shoot-off, Valentine proved victorious.

Mr. John Klenk was the only one to kill 10 birds straight out of the twenty-two contestants who participated in the shoot of the Hell Gate Gun Club, at Outwater's, on Friday of last week.

Mr. A. H. King won the president's cup, donated by Mr. C. A. Painter, at the shoot of the Herron Hill Gun Club, of Pittsburg, Pa., on Friday of last week. He scored 19 out of 20 birds in that contest.

April 23 was fixed upon as the date for the three-cornered team shoot between the Ossining and Schenectady gun clubs, on the grounds of the Poughkeepsie, N. Y., Gun Club. The Schenectady Gun Club is also included in the contest.

A match at 100 targets, \$100 a side, has been arranged between Messrs. S. M. Van Allen, of Jamaica, L. I., and John H. Henderson, of Long Island City. It will be shot on the grounds of Freeport, L. I., Gun Club on Saturday of this week.

We are informed that Messrs. Knox & Knapp have recently erected a club house, on the Scward avenue grounds of the Auburn, N. Y., Gun Club, and installed a Leggett trap. All shooters welcome every Thursday afternoon. Targets one cent. A tournament will be held May 18 and 19, with a good programme, added money and one good merchandise event. Everybody welcome.

The Pattenburg, N. J., Gun Club have issued the programme for their second annual tournament, to be held April 25. There are four events provided, three merchandise prizes to each. If time permits, sweepstakes will be shot. The value of the prizes is about \$100. Shells can be obtained on the grounds. For further information address the secretary, Mr. C. W. Bonnell, to whom guns and ammunition may be sent.

The Patriots' Day shoot of the Worcester Sportsmen's Club, to be held on their grounds at Shrewsbury, provides twelve events, nine at 10 and three at 20 targets, 65 cents and \$1.30. Totals: 150 targets; \$9.75. Moneys divided 50, 30 and 20 per cent. Targets, 1½ cent, included in entrance. Shooting commences at 10 o'clock. Dinner at Haven at 1 o'clock. Extra events if time permits. Mr. E. C. A. Becker is president. Mr. H. M. Winchester is secretary.

The team shoot between the New England Kennel Club and the Boston Athletic Association, the first of a series of three, was won by the former, at Braintree, Mass., on April 2. There were five men on a team, 50 targets per man. The members were: Boston Athletic Association—S. A. Ellis, George B. Clark, W. L. Hill, C. M. Howell, E. F. Gleason. New England Kennel Club—Thomas Silsbee, W. F. Beal, L. C. Fenno, Thomas F. Baxter, H. N. Richards.

The programme of the silver shoot, given by the Bound Brook, N. J., Gun Club, April 16, can be obtained of Dr. J. B. Pardoe, the club secretary. There are eleven events, nine at 15, one each at 5 and 25 targets. There are from one to four silver prizes in each event. Five dollars covers the total entrance for the day. Shooting commences at 10 o'clock; practice from 9 to 10 o'clock. Shells may be obtained on the grounds. Paid experts and targets only is the rule, excepting that a silver loving cup will be given respectively to the professional and amateur making high programme average.

Secretary D. W. Hallam informs us that the target trapshooting season of the Dover, N. H., Sportsmen's Association will begin on April 21.

The president of the South Side Gun Club, of Milwaukee, Wis., Mr. James E. Bush, has offered a silver loving cup for competition by the club members, the conditions of which are that a contest will take place for it each week, commencing April 2 and ending Jan. 1, 1905. The member who participates in the greatest number of contests wins the cup. Thus, it is a matter of regular attendance.

Secretary E. J. Loughlin, Utica, N. Y., writes us as follows: "The Riverside Gun Club's shooting house and equipments were swept away by recent flood in this vicinity and have become a part of the valley driftwood. This misfortune, however, will not deter us from being in the game the coming season. Our grounds will be put in condition for regular shoots as soon as the present high water recedes."

Mr. S. G. Miller, secretary of the Haverhill, Mass., Gun Club, writes us as follows: "The feature of our eighth annual Patriot's Day tournament, April 19, will be a five-man team match, 50 targets per man. Open to all gun clubs. Each member of the winning team will be presented with a suitable souvenir. We have already received assurances that the Boston Gun Club, of Boston; the Birch Brook, of Lynn, and Powwow Gun Club, of Amesbury, will be in the field with a team, and the home club will try and make it interesting for the visitors. We are quite sanguine of several other teams being present. A cordial invitation is extended to all shooters."

The programme of the Interstate Association tournament, given for the Americus, Ga., Gun Club, April 27 and 28, has nine events each day, five at 20 and four at 25 targets, \$2 and \$2.50 entrance, \$12.50 and \$15 added. Dinner will be served on the grounds each day. Targets, 2 cents. April 26 will be practice day. No handicaps. Rose system, 7, 5, 3, 2. Guns and ammunition, prepaid and sent in owner's name, care of the secretary, H. S. McCleskey, will be delivered on the shooting grounds free of charge. Mr. McCleskey will present a loving cup to the contestant who makes the highest average. Mr. Lawson Stapleton will present a pair of shoes to the amateur making the longest straight run. Secretary-Manager Elmer E. Shaner will manage the tournament.

BERNARD WATERS.

#### U. M. C. Southern Squad.

THE U. M. C. Southern Squad began at Paducah, Ky., the last week of their three months' tour, Monday, March 28. The Paducah Gun Club were out in full force, giving the visitors a rousing reception.

The day was ideal for shooting, and every one shot exceptionally well. Billy Heer missed but one out of 100 targets, and he was high man. The Squad averaged 94 per cent. for the day.

On Tuesday, Owensboro, Ky., was the place, and Davies County Club entertained. Heer ran 100 straight, and Budd came next with 97. The Squad this day averaged 93 per cent.

At Louisville, Wednesday, with the Jefferson Country Gun Club, the fine work of the two previous days was continued. Here the Squad averaged 97 per cent. Also a number of amateurs caught the spirit of their associates, and made some enviable runs.

This has been a most interesting State to visit, and all vote that Kentucky is not a "hard road to travel." For the three days Mr. Heer had an average of 99 per cent., breaking 297 out of 300. The Squad for the three days had an average of 94.23 per cent., which is most phenomenal, considering the fact that they have been traveling nights and shooting nearly every day for the past three months. The scores, 100 targets, follow:

	Paducah.	Owensboro.	Louisville.
T A Marshall.....	93	90	96
C W Budd.....	97	95	96
W H Heer.....	99	100	98
E D Fulford.....	91	90	96
J L Head.....	91	90	97

#### Schmelzer Tournament.

KANSAS CITY, Mo.—It gives us pleasure to inform you that we have completed all details and the programme for the coming tournament of the Interstate Midwinter Shooting Association on April 18 to 22, inclusive, to be held on the grounds of the Schmelzer Athletic and Shooting Park.

Our programme calls for 200 targets a day; two and a half days will be devoted to these events. On the third day there will be a target team shoot, four men to the team, 50 targets per man, and open only to teams from the States of Kansas, Missouri, Illinois and Iowa. A handsome loving cup trophy is offered as the prize in this contest. The fourth day will be live-bird shooting, 25 live birds to the man, entrance \$20; \$100 in cash added. The fifth day will be a team shoot on live birds, five men to the team, and to the winning team the J. F. Schmelzer & Sons Arms Co. awards to each of the contestants a handsome loving cup, besides the winnings they will get. The Wyeth trophy, emblematic of the world's championship on targets, will also be contested for, as well as the T. B. Combs' target trophy, given to amateurs. A total of \$400 in cash and over \$500 worth of trophies are the inducements held out; and from the number of those already received, the shoot will certainly be a pronounced success.

CHAS. J. SCHMELZER.

#### Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., March 31.—To-day, the last day of March, instead of bright sunshine and warm spring air, with the robin and bluebird singing gayly, a young blizzard was raging, and gloves and overcoats were none too comfortable. Notwithstanding the unfavorable conditions, five men faced the score, and endeavored to smash bluerocks that were being thrown to the limit of the trap, a good 70yds. The scores made, while not high, were very good, considering conditions. In the cup event, Winans scored a win, while Smith came within one point of tying him. Traver Smith and Winans now have four wins each out of the six necessary, while several others have three each.

The Schenectady and Ossining gun clubs will each send a team here on the 23d inst. to compete in a three-cornered team match.

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6

SNANIWEH.

### IN NEW JERSEY.

#### Patterson Gun Club.

Patterson, N. J., March 26.—The regular monthly shoot for the medals took place Saturday on our pleasant grounds, and was represented by nine contestants. The result was that there were two ties—A. E. Holbrook and N. Stamets. On the shoot-off A. E. Holbrook took charge of the gold medal and Hunter badges; N. Stamets took the silver one.

We hope to see a good crowd out to our tournament on April 15, when we will give about \$100 in prizes. We ask all readers who like a good day's sport to attend.

Medal shoot scores:

C. W. BONNELL, Sec'y.

#### Franklin Gun Club.

Franklin Furnace, N. J., April 2.—Shooting at 25 targets, Ander Wright broke 18, Ed Winters 9, Charles Redimer 15, John Williams 14, Frank Kishpaugh 18 out of 27, James Stephens 19 out of 29, W. Stephens 24 out of 30, Fred Southard 24 out of 53, Alfred Wright 33 out of 52, Milt Morgan 22 out of 44.

FRANK KISHPAUGH, Sec'y.

#### Bound Brook Gun Club.

Bound Brook, N. J., April 2.—The Bound Brook Gun Club to-day held its first shoot for the handsome silver loving cup donated by Dr. J. B. Pardoe, a very active member of the gun club.

The wind made target shooting very trying, as it came in gusts, and made the targets tower skyward. Owing to the high wind, only eight members contested for the Pardoe trophy. T. K. Stelle and A. K. Smith tied. B. Prugh came in second with 24. In the shoot-off, Stelle and Smith tied again. Then they shot from scratch at 5 targets, and still they were a tie. In the next 5 Smith came out one target ahead, and was the winner.

The Bound Brook Gun Club expects to hold a silver shoot April 16, all prizes are silver. The club will have an automatic trap, which will make it worth coming to see in action and to shoot over.

The club holds its regular shoot on the third Saturday of each month. All visitors are welcome.

Trophy shoot: Dr. J. H. V. Bache (4) 17, Leon Du Four (12) 22, T. K. Stelle (10) 25, S. W. Dunning (11) 22, A. K. Smith (12) 25, Dr. J. B. Pardoe (2) 17, Mr. Morris (11) 23, B. Prugh (12) 24.

Shoot-off: Stelle 25, Smith 25.

Second shoot-off, 5 targets: Stelle 3, Smith 3.

Third shoot-off: Stelle 1, Smith 2.

Other events, each at 10 targets:

#### South Side Gun Club.

MILWAUKEE, Wis.—For the purpose of stimulating the attendance of members of the South Side Gun Club, the oldest trapshooting organization in Wisconsin, President James E. Bush has offered a silver loving cup for competition, which will be conducted along novel lines, as the trophy will be awarded to the member who shoots the greatest number of scores during the nine months which constitute the club's season. Skill in snuffing out bluerocks will not count at all in this contest, which will be one of endurance and regularity in attendance instead. The first shoot for the cup took place April 2, and the final date set for competition is for Jan. 1, 1905, when the winner will be announced.

There was never a time in the history of sport in this city when the interest in trapshooting reached the point it has at the present time.

There are six live clubs in full operation at the present time, and weekly meetings attract a large proportion of the membership of each organization. The South Side, Wisconsin, Jolly, Cream City, National, and Parker clubs have the largest memberships, and in addition, there are two rifle clubs which hold weekly competitions to bring the members together. The Milwaukee Sharpshooters and Milwaukee Rifle Club have distinct organizations, as well as separate ranges, on which high scores are made when the members get into competition.

Following are the scores made to-day by the several clubs:

#### South Side Gun Club.

Targets:	15	15	15	15	15	15

# AMMUNITION

## SERVICE OR SPORT.

**UNITED STATES CARTRIDGE CO.**  
**LOWELL, MASS.**

**Agencies:** 497-503 Pearl Street, 35-43 Park Street, New York.  
114-116 Market Street, San Francisco.

With the closing of March and a prospect of good weather, it is a pleasure to inform your readers that after many long months Harold Money has returned to Kansas City, where he suffered so severely a year ago, when he lingered between life and death. He is to-day strong as ever; he claims to enjoy better health, in

The members of the Abilene, Tex., Rod and Gun Club are getting enthusiastic and will at least keep the traps going weekly until after the shoot at Brownwood, which will bring all the northwestern Texas shooters together. Shooting at 50 targets, results as follows: Malone 3, Douglas 36, Motz 27, Briggs 37, Jackson 23, Steffens 16, Winniford 43, Craig 32, Sterrett 41, Mrs. Sterrett 28, Mackechnev 8.

Goko's final 10 in the prize match landed him one target in the lead over Hodsdon and Woodard, and certainly is getting accustomed to the new gun in fine style, if scores prove anything. Bell's score in the prize match cut out a previous 17 and now stands one target from first place. Frank says, he "will never get there if I can help it," and being leader at present, he has just a little to say about it.

Team match:					
Frank	15	18-23	Burns	13	9-22
Bell	11	9-20-43	Gokey	10	7-17-39
Blinn	13	9-22	Reed	12	8-20
Owen	12	8-20-42	Jones	11	7-18-38
Woodruff	11	5-16			
Hodsdon	13	10-23-39

Jas. R. Merrill, Sec'y.

## Ohio Trap.

## Cincinnati Gun Club.

CINCINNATI, O.—Each week a few members find it impossible to be at the grounds on Saturday, and therefore shoot their scores early the following week. In the cash prize shoot of March 26 the following scores, 50 targets, should be added: Diek (18yds.) 42, Grau (19) 41, C. Dreihls (18) 40, Jay Bee (17) 38, Sampson (17) 35, Bleh (16) 35, Cook (16) 26, H. Weller (16) 26, B. Weller (16) 28.

The first of the week the following matches were shot, 50 targets per man, two high men out:

Events:	1	2	Events:	1	2
Gambell .....	44	44	Grau .....	41	40
Dreihls .....	43	43	Medico .....	40	43
Faran .....	42	42			

Shoot-offs of tie in No. 1:

No. 1: Medico 20, Dreihls 20.

No. 2: Medico 23, Dreihls 22.

April 2 was a pretty day, clear, bright and spring-like, with a crispness in the air which made out-door sport a pleasure. The only drawback was a strong west wind, which made the targets very puzzling in their flight, and caused more than one of the shooters to drop below his usual mark.

In the Parker gun shoot R. Trimble was high man with 91 actual breaks, a very fine score under the conditions. Barker was second with 88, and Faran third with 82. Nine full scores were made including handicaps.

Jay Bee was out to-day for the first time in several weeks. He shot in a few practice events, but did not stay long.

No. 2 set of traps was used to-day for the first time since the new trap house was built. The background for some of the flights is not so good as at No. 1, the targets showing against a thick grove of trees.

Ralph Trimble starts for Bristol, Tenn., the first of the week to attend the Interstate Association tournament. He will also be present at the Indiana State shoot on April 12 and 13, at Indianapolis.

Some shooting has been done during the week, the most noteworthy being a match at 50 targets per man, on March 30. The scores follow:

Parker prize gun contest, 100 targets, handicaps added targets; handicaps, breaks and totals in the order mentioned, follow: Barker (14) 88, 100; Faran (18) 82, 100; Payne (50) 74, 100; Plunkett (40) 72, 100; Pohlar (35) 69, 100; Harig (40) 67, 100; Willie Green (40) 65, 100; Boeh (40) 61, 100; Hake (50) 58, 100; Captain (25) 73, 98; Roanoke (40) 57, 97; Maynard (18) 78, 96; Jack (30) 66, 96; Randall (15) 80, 95; Herman (30) 63, 93; R. Trimble 91; Bullerdick (30) 60, 90; Block (18) 68, 87; Linn (25) 59, 84.

Match, 50 targets:

Targets:	25	25	Targets:	25	25
Gambell .....	24	23-47	Barker .....	20	18-38
Harig .....	21	20-41	Faran .....	16	20-36
	45	43-88		36	38 74

Match, 50 targets, March 30:

C. Miller .....	17	16	33	Hirtzinger .....	14	14	28
Wm. Poole .....	15	19	34				

Mr. J. H. Strong shot at 15 in event No. 4.

## Springfield (Ohio) Gun Club.

The following scores were made at the regular weekly shoot of the Springfield Gun Club, held on March 28.

The Young handicap medal was won by C. Miller, after shooting off a tie on 23 with E. Watkins and J. Foley. High gun honors for the day were divided by Foley and Watkins, with 84 each.

## Trap at Dayton.

At a meeting of Dayton, O., shooters held at the Phillips House on March 26, the following gun clubs were represented: Buckeye, N. C. R., Davis, Rohrer's Island, West Side, and Gem City. A consolidation of the gun clubs of the city was effected, the new organization to be known as the Dayton Gun Club. A committee to select grounds was appointed and consisted of Messrs. Zenas Craig, chairman; C. H. Cord, W. C. Breenc, W. H. Orth, Charles Taylor, H. L. Monbeck, Elmer Lewis. The new club will issue 2,000 shares of stock at \$5 a share, and when 50 per cent. of the stock has been paid for, will incorporate under the laws of the State. A. W. Ryan, of Troy, will act as special solicitor for new members. The clubs interested in this movement will continue their regular shoots on their old grounds until the new grounds are fitted up. The Rohrer's Island Gun Club will not surrender its individuality. Some of its members will undoubtedly join the new club, but Rohrer's will continue to hold its weekly shoots on

its own delightful grounds. The officers elected: John L. Theobald, President; A. F. Kemper, Vice-President; Chas. Wertz, Treasurer; O. H. Bailey, Secretary.

BONASA.

## New York Athletic Club.

TRAVERS ISLAND, N. Y., April 2.—The regular club shoot took place to-day and was fairly well attended. The main event was a 50-target handicap for a handsome Sauer gun, presented for competition by Mr. H. Sauer. These shoots will continue during April and May.

Mr. G. Greiff was an easy winner with a score of 46 out of 50, a handicap of 4 making a total of 50. A close second was Mr. Barnes, who shot in good form and captured the April cup with 24 out of 25.

On April 9 Travers Island will be opened for all members, which no doubt will be a great benefit to the trapshooters and their friends:

Fifty-target handicap for Sauer gun trophy:

King, 14.....	100100101101001001001010	29-43

## Rochester Rod and Gun Club.

ROCHESTER, N. Y., March 30.—The event of chief interest centered at the shoot of the Rochester Rod and Gun Club to-day was the Monroe county diamond medal championship, for which Mr. Harry M. Stewart, holder, and Thomas F. Adkin, challenger, were opposed to each other. They tied on 89, and tied again on 90 in the shoot-off. Darkness intervening, competition was necessarily suspended. The scores of the Monroe county championship follow:

Stewart.....	24	20	22	23-89	Bonbright.....	20	22	21-84
Adkin.....	23	21	23	22-89	Snow.....	21	20	24-83
Clark.....	22	20	23	21-86	Watson.....	21	20	29-81

Shoot-off:

Stewart..... 21 23 22 24-90 Adkin..... 23 21 22 24-90

In the Rochester Rod and Gun Club's spring handicap contest contestants and scores were as follows:

## SIDE LIGHTS OF TRADE.

The Ithaca Gun Company, which has been conducted as a co-partnership for the past twenty-two years, has recently been incorporated under the laws of the State of New York. The officers are Geo. Livermore, President; L. P. Smith, Vice-President; C. H. Smith, Secretary; Paul Smith Livermore, Treasurer. The management remains unchanged, and the incorporation is the result of an increase in business from year to year until the Ithaca Gun Company became too large to be run under a co-partnership.

Messrs. Parker Brothers, Meriden, Conn., write us that "W. R. Crosby, one of the champion shots of the world, was treated to a surprise recently at Atlanta, Ga. Despite a heavy wind, amounting almost to a gale, Mr. Crosby broke 94 out of 100 clay birds, a remarkable record under such adverse circumstances, and yet he was beaten by one bird, as Mr. B. H. Worthen smashed 95 of the clay flyers. The battle between these two was a right royal one, and Mr. Worthen used, as he always does, the old reliable Parker gun."

## PUBLISHERS' DEPARTMENT.

## A Demand for Clean Papers.

From an article by M. Lee Starke.

No decent family would think of inviting a vulgar person or one of uncertain character into its home, yet permits the delivery of newspapers containing advertisements which, if read aloud, would cause the blush of shame to mantle the cheek of each member of that family. They refuse pollution in one form and embrace it—perhaps unconsciously in some cases—in another. No publisher wants to feel that his columns are disgraced, so the question naturally arises, Why does he permit the publication of such rot? There can be but one answer—greed. He wants money, and he sells the good name of his paper, and even his own self-respect, for "the root of all evil."

I am a newspaper man, and believe that the most profitable publicity in the world is that secured by the intelligent use of space in daily papers. It not only produces the best, but the quickest results. The daily comes nearer to giving a dollar's value for a dollar than any other medium; in fact, the family circle newspapers offer an advertising investment the interest on which is compounded daily.

If decent advertisers would refuse to associate with the questionable ones, and would use only clean papers, and if respectable families would see to it that only clean papers are received into their homes, it would remedy the existing conditions.

## They Were Both Wrong.

During some army maneuvers in England, two officers were disputing about the classification of a tree. One was sure it was a birch, the other was equally certain it was an ash. A private was at length appealed to to settle the question. He looked up and down the tree, walked around it, stripped a piece of bark of and dug into the trunk with his bayonet. "What are you doing that for?" asked one of the officers. "To find out what kind of a tree it is, major." "Well what is it?" The private gave another dig and made a minute inspection of a splinter, then delivered judgment. "You are both wrong," he remarked respectfully, though authoritatively. "It ain't a birch tree and it ain't a hash tree; it's an hordinary wooden 'un."—Unidentified Exchange.

## Pennsylvania Railroad's Washington Tours.

The Pennsylvania Railroad's seventh three-day personally conducted tour to Washington will leave New York, Brooklyn, Newark, Elizabeth and Trenton, April 14. Round-trip rates—only difference being in the hotel selected in Washington—are \$12 and \$14.50 from New York; \$10.50 or \$13 from Trenton, and proportionate rates from other points. Tickets cover railroad transportation for the round trip and hotel accommodations. A special side trip to Mt. Vernon may also be taken. All tickets are good for ten days, with special hotel rates at expiration of hotel coupon. For itineraries and full information apply to Ticket Agent; Tourist Agents, 263 Fifth avenue, New York; 4 Court street, Brooklyn; or Geo. W. Boyd, General Passenger Agent, Broad Street Station, Philadelphia, Pa.

"In the Maine Woods," published by the Bangor & Aroostook Railroad Company, began as a booklet, but has now attained the proportions of a large magazine. It contains nearly 200 pages, descriptive of the fishing, camping, canoeing and hunting in Maine, and is finely printed and beautifully illustrated. A copy may be had for 10 cents in stamps sent to C. C. Brown, G. P. & T. A., Bangor, Me.

## New Advertisements.

Attention is called to the handsome offers of cash prizes for photographs of yachting and camping scenes, made by Messrs. Geo. B. Carpenter & Co., of Chicago, as set forth in our advertising columns. Messrs. Carpenter & Co. supply sails, tents, camp outfits, marine hardware, etc., to outers, and offer two catalogues, the Marine, which will be sent for 6 cents in stamps, and the Tent and Camping catalogue for 4 cents.

All of us who are much out of doors, whether we hunt or fish, travel in yacht or canoe, climb mountains or ride long distances over the prairie, know how important to the comfort is proper footgear. The many people who have used the Wittich hunting and fishing boot manufactured by Wittich Sons & Co., of Detroit, Mich., are able to testify that these goods always give satisfaction. Whether it is a hip boot for a horseback rider, or a low, tramping shoe for a New England gunner, they are able to supply the article needed.

## BAKER SPECIAL PARAGONS.

Strictly high grade. Built to order at regular prices. \$60, \$75, \$200 and up. Carefully fitted and highly finished. Baker guns have a long established record for hard shooting and great durability.

Send for FREE QUARTERLY and 1904 booklet fully describing all grades.

**BAKER GUN AND FORGING CO.,**  
Cor. Liberty & School Sts., BATAVIA, N. Y.

## MY TRAP SCORES

A pocket trap score book, containing 50 pages of score sheets and the Interstate Association Rules for target and live bird shooting, and for shooting under the Sergeant System. The cover bears the title "My Trap Scores," and the pages, in number and form, are arranged to make a complete record of the shooter's doings at the traps. The pages are ruled to make a record of the place, date, weather conditions, number of traps, number of shooters, gun and load used, events, etc. The score sheets are ruled for 25 targets. Bound in leather. Price, 50 cents.

### THE UNJUST TAX ON AMMUNITION.

If the average well informed shooter were asked where the fulminate of his shot gun and rifle shells was made, he would probably say that it was a product of the factories of those shell manufacturers whose names are as household words. But he would be in error; it comes from Canada. The reason for our importing the fulminate instead of making it ourselves, and of our paying such a high price for it, is found in a chain of circumstances which are among the curiosities of the United States Internal revenue system. The explanation is given in the report of the census for 1900 as follows:

Although charges of dynamite and other high explosives are invariably fired by detonators or blasting caps charged with mercuric fulminate, and although percussion caps, friction primers and fixed ammunition are also charged with this explosive, yet the amount of this most important and essential explosive which is returned as manufactured in the United States was quite insignificant. On the other hand \* \* \* the importation of fulminate is assuming greater and greater importance as our home industry in other explosives grows, and this is shown even more markedly if to the values for the fulminate there be added those for the blasting caps, percussion caps and cartridges that are also imported.

The fact that, notwithstanding the dangers attendant on the transportation of this violent explosive substance, its home manufacture has been almost completely superseded by the foreign product, is explained on stating that it is manufactured from grain alcohol, mercury and nitric acid; that for every twelve parts by weight of mercury fulminate produced, 110 parts by weight of 95 per cent. alcohol are consumed; and that the tax levied in the United States on alcohol makes the foreign commerce in this article a very profitable one, and home competition practically impossible.

The revenue tax on the alcohol used in the manufacture of fulminate powders, or fulminate of mercury, the explosive agent used in percussion caps and cartridges of all kinds, is \$2.08 per gallon. This is prohibitive of home manufacture. "Practically all the fulminate of mercury used in the United States," says an authority on the subject, "is now made in Canada, the alcohol being shipped from this country in bond without payment of tax and used in bonded manufacturing warehouses in the preparation of the fulminate. This is exported to the United States, paying a customs duty of 30 per cent. *ad valorem*, which is considerably less than our internal revenue tax on alcohol necessary to manufacture it." The commercial alcohol tax means, then, in this case, that Canadian workmen get the employment which, with free alcohol, American workmen would have; we pay an increased price for our ammunition, and American manufacturers are shut out from the markets of the world.

But this is only a part, and a minor part, of the drain which the tax on alcohol makes on the sportsman's purse when he opens it to pay for his ammunition. Of greater moment is the increased cost of smokeless powders caused by the increased cost of alcohol, which is a considerable constituent of their composition. Every pound of the best smokeless powder is taxed thirty-seven cents for the alcohol employed in its making. That is to say, it costs to make thirty-seven cents more than it would cost were the alcohol of the kind used in its manufacture free of tax. The manufacturer, of course, gets his money back. The consumer pays it. The \$2.08 per gallon for alcohol in this particular instance comes out of the pocket of the man who shoots the gun. The sportsman is taxed twice for his cartridge, once for the fulminate and again for the powder.

It is worth noting, too, that the sportsmen of no other civilized country on earth have to pay an increased cost for their ammunition by reason of a tax on alcohol. Everywhere else than in the United States alcohol for industrial purposes is free of tax.

Why are we thus taxed for our ammunition? For the same reason that we are taxed for our hats, furniture, typewriters, perfumery and everything else into the manufacture of which alcohol enters. And that reason, so far as any is discernible, is to give increased profits to the wood alcohol interests. Wood alcohol is untaxed. Taking advantage of the tax of \$2.08 on alcohol made from corn, potatoes and other farm products, the distillers of wood alcohol sell their eight to ten millions of gallons per year at a vastly increased profit. It is this immense profitability of the wood alcohol industry which is stimulating the denudation of vast areas of forests.

A measure introduced in the House of Representatives by Mr. Boutell, and now in the hands of the Committee on Ways and Means, provides as follows:

"That distilled spirits of an alcoholic strength of not less than one hundred and sixty per centum proof, as defined by sections thirty-two and forty-nine of the Revised Statutes of the United States, may, when rendered unfit for drinking purposes or for use as a beverage, be removed from distillery warehouses free of tax under such regulations as the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury shall prescribe: *Provided*, That sulphuric ether, wood alcohol, methylic alcohol, wood naphtha, or other substances approved by the Commissioner of Internal Revenue and the Secretary of the Treasury, shall be mixed with such distilled spirits so as to render the same unfit for drinking purposes or for use as a beverage."

Other sections make provision for so controlling the treated product that it may not be rectified for use as a beverage.

As has been said, the only opposition to the enactment of Mr. Boutell's measure comes from the wood alcohol interests, which under the existing system have extraordinary favoritism. If beyond this selfish favoritism of a class there is any reason why the sportsman should continue to pay 37 cents a pound more for his powder than he would without the alcohol tax, we have been unable to surmise it. Or why we should pay more for the thousand and one other things which are taxed at the rate of \$2.08 for every gallon of alcohol used in their manufacture. Or why, by government intervention, we should stimulate the wood alcohol industry, which is laying waste the forests. The forestry question, it is true, is, for most of us, academic; we have convictions on it and some sentiment; but it does not appeal to us with the force and directness of something that touches the pocket. Every one of us, on the contrary, who uses a gun or rifle, may measure the personal interest he has in the passage of the Boutell bill by multiplying the number of the pounds of smokeless powder he uses in a season by the number 37, which represents the excessive price per pound he will have to pay for his powder until the bill shall have become a law.

### RAILROADS AND FISHING.

There is very little free fishing for trout on Long Island. On the other hand, that island affords some of the best preserved fishing anywhere in New York, but this is accessible only to the persons for whom it is preserved.

In the interior things are somewhat different. A vast number of streams, large and small, flow down into greater rivers, and afford a vast mileage of fishing waters. Ten or fifteen years ago many of these brooks and little rivers were so persistently fished that they were almost exhausted, and in many cases yielded the scantiest return to the ardent angler. In present years, however, the fishing is much better; and this has come about from a source which most people would hardly have expected—through the restocking of the waters by the railroads passing near them.

It is well recognized that all the railroads which penetrate big game countries make a great feature of their hunting advantages, and of late years the attraction which shooting and fishing offers to a large class of the public has come to be generally appreciated by railway and steamboat lines everywhere.

Their advertising in periodicals, and the special booklets which so many transportation lines now prepare for the sole use of those devoted to the pastimes of the gun and rod, show how important this feature of travel has become. Efforts are constantly being made to render new regions accessible to hunter and angler, to find out what these regions contain in the way of game and fish, and to furnish the detailed information which the sportsman requires. It is not enough nowadays to talk in general terms about the hunting and fishing of any region, without knowing anything about it. Real effort is made to give accurate information, so that the successful sportsman shall patronize the line year after year, instead of visiting the country once, finding it misrepresented, and then going away disgusted, to return no more.

As competition grows more and more keen there is an eager rivalry among the railroads for the patronage of big-game hunter, gunner and angler; and with this in mind roads like the Erie, the Delaware, Lackawanna and Western, and the New York, Ontario and Western each year put themselves to a considerable expense of time

and money to keep up the supply of fish in the streams near which their lines pass.

This is money well invested by the railroads and it certainly is a great benefit to the angler. It is possible nowadays, by consulting the booklets issued by the different roads, to get a deal of information as to streams, hotels, teams, and matters generally of interest to the angler, so that, assuming all this information to be accurate, he need not go astray, and, if weather conditions are satisfactory, is reasonably sure of a successful trip.

There are many old timers who declare that the railroads are the primary cause of the present scarcity of game and fish, and it is, of course, true, that by bringing a multitude of people into a region once given over to solitude the roads are the indirect cause of the destruction of the wild creatures which occupied these solitary places. But it seems that the pendulum has now begun to swing back again, that the railroads are stocking the waters with fish; and it is conceivable that the time may come when these great corporations will find it to their interest to restock the covers with game.

### NEW YORK SPRING SHOOTING.

This year the New York spring shooting of wild fowl resembles the reptilian fauna of Ireland. There is none. The advocates of the repeal of the present law succeeded in passing the Hubbs bill in the Assembly, without allowing the supporters of the present law to be heard, but when the bill reached the Senate the story was a different one. What was done at the hearing before the Senate committee, to which the bill was referred, was duly reported in the FOREST AND STREAM.

In due course the time came for action on the bill, and Senator Bailey, of Suffolk County, moved to discharge the Forest, Fish and Game Committee of the Senate from further consideration of Assemblyman Hubbs' bill to permit spring shooting on Long Island. The vote on this motion is given below, those voting in the affirmative, favoring spring shooting. This is the final defeat of the measure in this Legislature.

Ayes—Mr. Bailey, Mr. Burton, Mr. Cullen, Mr. Dooling, Mr. Dowling, Mr. Fitzgerald, Mr. Foley, Mr. Frawley, Mr. Grady, Mr. Hawkins, Mr. Keenan, Mr. Martin, Mr. McCabe, Mr. McCarren, Mr. Plunkett, Mr. Ramsperger, Mr. Riordan, Mr. Russell, Mr. Townsend, Mr. Wagner, Mr. Whitlock.

Nays—Mr. Allds, Mr. Ambler, Mr. Armstrong, Mr. Barnes, Mr. Brackett, Mr. E. R. Brown, Mr. W. L. Brown, Mr. Carpenter, Mr. Elsborg, Mr. Fancher, Mr. Gates, Mr. Goodsell, Mr. Green, Mr. Hill, Mr. Lefevre, Mr. Lewis, Mr. L'Hommedieu, Mr. Malby, Mr. Marshall, Mr. McEwan, Mr. Raines, Mr. Sherwood, Mr. Stevens, Mr. Stewart, Mr. Warnick, Mr. White, Mr. Wilcox.

It is worth while for the readers of FOREST AND STREAM to keep this list for future reference, for it shows the position of the various New York Senators on the question of spring shooting. It shows also a respectable majority in the Senate in favor of game protection, and that the New York City and Brooklyn Senators on the whole are in favor of spring shooting.

New York is the great market of the Atlantic seaboard for game of all sorts, including wild fowl. If market gunners find that wild fowl cannot be sold in New York the inducement to kill them almost ceases to exist. Recently, in some of the southern States, and especially along Currituck Sound, the price of canvasbacks fell to seventy-five cents a pair—a price lower than they have brought for many years, the usual price to gunners being \$2.50 or \$2 per pair. The price for other ducks fell correspondingly, so that ducks hardly paid for the ammunition used to kill them.

The local gunners could not understand what such a fall in prices meant, but since they could not get more than this for their birds, many of them have given up shooting, declaring that rather than kill canvasbacks at such a price they would let them go, to return to their northern homes and breed to bring back others next autumn.

The great fall in the price of canvasbacks and other ducks is, no doubt, due to the fact that the New York market is no longer open to them in spring. The markets of other large cities became glutted, and the buyers of birds could not get rid of their stock; they therefore ceased to buy, the gunners ceased to shoot, and the fact that shooting or possession of wild fowl in New York is forbidden in spring has stopped the shooting of birds in Maryland, Virginia, North Carolina, and no doubt in many other States. So far reaching is the action of the New York Legislature in this matter.

# THE SPORTSMAN TOURIST

## Floating Down the Mississippi.

### IX.—Reelfoot Lake—Part One.

RAYMOND S. SPEARS.

for 120 miles. Another line of the same length run due west, then north and east again, making a square, will indicate sufficiently closely the area of intense and acute disturbance. If the map used is the Index Chart of the Mississippi from the Mouth of the Ohio to the Gulf of Ohio, it will be seen that the district is largely "alluvial"—built of river sediment—and still the playground of many streams. To those who like history, the names New Madrid, Gayoso, Columbus, and Fort Pillow will indicate one branch of interests centered in this arbitrary square. New Madrid comes first of all to the mind. As a fighting town, New Madrid is famed.

The trembling of the earth continued for a number of years before they more than sent the wild birds screaming into the air, and caused men to more than cease for a moment from their ordinary occupations of hunting and land clearing; but, according to Judge Hawyard's account (in the '20s), about Dec. 14, 1811, a dark fog, with the smell of sulphur in it, seemed to exude from the earth, the wind ceased, and a dead calm ensued. And then, at 2:30 o'clock on the morning of Dec. 16, "an awful noise, like distant thunder, only more hoarse and vibrating," was heard coming from the west. The ground began to jump, cabins fell down, trees whipped through the air, and the inhabitants of New Madrid, screaming and running through the town, were enveloped in darkness, caused by "the saturation of the atmosphere by sulphurous vapors." At daybreak, after many minor vibrations, came another, more violent than the rest. "The earth rolled in waves a few feet in height," which burst as they came, spurning stone and coal and sand "as high as the tops of the trees," and in the river "spouts of water three to four inches in diameter shot up to a great height."

All kinds of animals, domestic and wild, rushed into the settlements and mingled with the equally terrified humanity, the chorus of cries being accompanied by the crash of trees whose roots were being twisted and tops snapped off—all to the music of earth-boomings. The waters of the streams sloshed against the banks from which they had jumped, and the "people of New Madrid, who had been noted for their profligacy and impiety," between spasms of sea-sickness, endeavored to get to their knees and clasp whip-sawed hands in earnest supplication.

A Mrs. Lafont fell fainting and died of fright. A Mrs. Harris was hit by a log from her cabin, as it fell, and died of her injuries. Many people fled inland and waded away from the river for miles with the water up to their waists, for the country was overflowed by water from the earth and from lakes whose beds had been raised higher than the banks. The graveyard caved into the river.

A succession of minor shocks succeeded these severe ones, till on Jan. 23, 1812, when another violent shock came, and was followed by days and days when the "earth as in continual agitation, visibly waving as a gentle sea." Till Feb. 7 this storm from the depths of the earth tossed the earth, and on that day came a concussion known as "the hard shock."

Each account of what occurred on Feb. 7 differs more or less, according to the narrator. But the stories seem to be all true. Eliza Brown, in a letter written to Lorenzo Dow, a preacher, described the New Madrid earthquakes, and his letter seems to have been edited with a dictionary of synonyms—nice, big words, and considerable grammar thrown in. The letter says:

"At first the Mississippi seemed to recede from its banks as the water gathered up like a mountain, leaving for a moment the keel boats that were here (New Madrid) on their way to New Orleans, on the bare

sand, in which time the poor sailors made their escape from them. It then rising from 15 to 20 feet perpendicularly and expanding, as it were, at the same moment, the bank overflowed with a retrograde current as rapid as a torrent," stranding keel boats far up the little creek, at the mouth of which they were tied. This water came back and the drift tore young cottonwoods in two as if "by art," so evenly was it done. Fish were left high and dry, and rumor said a woman and several children were drowned from a "torn up" keel boat.

Nolte, a merchant, in "Fifty Years in Both Hemispheres," was tied to the New Madrid landing in a keel boat. He reached the town on Feb. 6, with about twenty other boats. "It was a clear moonlight night. My friend Hollander had retired to rest, and I was sitting about 12 o'clock at a little table, sketching a little caricature of Madison, then President of the United States. I had just given the last touches, when there came a frightful crash, like a sudden explosion of artillery, and instantly followed by countless flashes of lightning. The Mississippi foamed up like the water in a boiling cauldron, and the stream flowed rushing back, while the forest trees near which we lay came crackling and thundering down." Clambering to the top of his boat—"our flats were still floating, but far from the shore. The agitated river was full of trees and branches, which the stream, now flowing in its proper current, was rapidly sweeping away, and a light only here and there in town—in short, a real chaos." The other boats had cut loose and were in the stream somewhere.

Judge Hayward says that in some parts the "river was swallowed up for some minutes by the seeming descent of the water into some great opening." Boats were "engulfed with crews and never heard from."

"At sunrise the whole terrible scene was revealed, and the little town of New Madrid, sunken, destroyed and overflowed to three-fourths of its extent, lay more than five hundred paces from us. Of the boats which surrounded us on the evening of Feb. 6, nothing was ever afterward heard," by Nolte, who pulled out next morning as soon as he could see.

Other things had happened. At what is now Hickman, Ky., which some inland fighters of the Civil War know, the face of the "bluffs" pitched into the river. The first steamer to come down the Mississippi was up in the Ohio River surrounded by drift, the pilots hopelessly puzzled, almost, by the islands that had disappeared, banks changed, bars and channels that were come or gone. And the newspapers here and there in the world had about a hundred words in regard to what happened six months or so later.

It is said that all but two families fled the New Madrid country. Things had happened beyond their comprehension—and not yet quite comprehensible. Incidents will show some of the phenomena. Ten miles below Little Prairie, on the Pemiscot River, old man Culbertson lived with his family. On the morning of Dec. 16, after the first big shock, a smoke house and well, which the night before were in the front yard, were seen on the far side of the river—the ground had split, spread, and the water taken to the crevasse. Chasms were opened all through the region, and some people fell in them; and right here the old-time frontiersman showed his expedients. He noted that the cracks ran from the southwest to the northeast, and, while leaving their profligate and impious ways permanently, many of them, they all felled trees to the southeast and northwest, and when the shakers came, ran to the big trees and hung fast to the branches, sometimes seeing their cabins swallowed up and chasms formed under their bridge; but the trees spanned the opens, and so the people helped themselves.

Crops were destroyed, food supplies spoiled by water and neglect, but wrecked keel boats cast their cargoes on the waters and "flour, beef, bacon, pork, butter, cheese, apples—in short, everything that is carried on the river—was in such abundance as scarcely to be matters of sale." For more than a year the people lived in light-roofed bark shacks that could fall on them and not hurt over much.

The earthquakes were not by any means confined to the New Madrid district. They reached to Quebec, and came from Central America, where they upset whole cities; nor were they confined to the years 1811-12. For ten years or so after the big ones, some little fellows that tumbled cabins out of shape, occurred, and for the next ninety odd years they came at intervals. I was writing the first draft of the Reelfoot stories, at Tiptonville, on Nov. 4, 1903, when "six of our little shakers came along," as they say 'round New Madrid. They sent folks out doors, scared one negro out of a cottonfield, and showed intense realism to a man who was hunting "local color." Five years ago one came that shook Blennerhassett Russel out of his bed at Besse (where the last one shook ten acres into the river), started a man out of the Halliday House in Cairo to the street in his night clothes, and almost ruined the sewer system of brick at Memphis, Tenn. Indeed, earthquakes are of so frequent occurrence in the New Madrid region that it is not good policy to put in cement

cisterns to catch drinking water, upon which people in the alluvial districts are largely obliged to depend. So the New Madrid earthquakes are by no means ancient history, but modern and in the experience of a notebook maker, who learned about them in a physical geography at school and then forgot all about it till he saw the brick in his fireplace wiggle, pull apart and then do a concentric circle puzzle act, so to speak.

At the time of the worst shocks—back in 1811-12—there were few people in the territory affected. Less than eight years previously the land west of the Mississippi had been purchased by the American Government, and that east of the big river in the bottoms still belonged to the Chickasaw Indians. Davy Crockett had not yet begun his bear hunting in the Obion River country. Elk were still found east of the Mississippi, and buffaloes had been hunted to the river within a dozen years. In fact the whole country was a howling wilderness; but the first steamboat had started on its voyage down the river and the new era of the valley commenced, one may say, with the earthquake.

Of course, one can believe anything or nothing in regard to the happenings in a land such as that. The traditions have involved people in many sorts of disputes, some purely intellectual; other involving such vulgar things as rifles, courts and such things that settle—if you boil them!

Most interesting of these, to the scientist, is perhaps the query whether the Mississippi River really flowed backward when the earthquake of Feb. 6-7 came. The listener to traditions will hear it stated that the river ran backward for "four hours," "an hour," "a long time." "The stream flowed rushing back," says Nolte, an eye-witness.

James C. Harris, who died last spring, reputed to be wealthier than any other citizen in Lake county, Tenn., and owning the most of Reelfoot Lake, said in an article for the Lake County Advocate, that the story was not true. He said:

"The truth is that the river runs due west at New Madrid, and the lurch or upheaval of the earth, coming from the west and passing eastward, caused an immense swell or wave in the river, and flat boats, skiffs, etc., were picked up by the wave and carried on top the bank, in many places one or two hundred yards above the place they were when the wave picked them up."

There is another theory, and that is based on the occurrence of such caves as that one Horace Kephart discovered running down under the bed of the Mississippi, the size of the Mammoth cave, Nick-o-Jack cave, etc. Far down under the alluvian of the valley is rotten limestone rock, disintegrating, and perhaps empty when the earthquake came. The great splits in the earth may have opened way for the water to these immense cavities, and into these flowed the water of the river, backward in places, and caused the mid-stream geysers by the sudden tremendous pressure. And again, it is asserted that when the ground shook so it sank, closing down on the porous limestone, and in sinking left openings in the banks, into which the river water ran till the lowlands were filled, again causing the backward current.

The collector of notes is bound to believe that all three things happened, for there are superficial facts that indicate it. Anyhow, the waters were mightily agitated, every one in the region was scared, and it is enough to know that in the west was lightning and thunder; the earth, unsettled by subterranean fires, sent waves whipping along the backbone of the continent, and these waves eddied in the New Madrid country—made a choppy sea, with whirling and jumping motions of the earth—passing on in waves that became ripples, and then tremors, flapping at last against the granite of the Adirondacks, their strength wasted.

Scientists have been here and pondered over the surface and subsoil, the meanderings and discharge of the valley and river, have disputed, corrected and considered as to this or that effect, as to the whys and wherefores of certain ridges, and certain cypress logs in Cairo sands, sycamores in the depths opposite Memphis, and yet have not gone into the details of these earth storms called New Madrid earthquakes. Doubtless, tucked away in various corners, are fragments of information, all of them together being adequate for the desires of a notebook maker; but just what happened—what came up out of the earth, what went down into it, which way the whirlpools went and what sent them—whether the Rocky Mountains or just those cliffs on White River—what things were shifted and what weren't. How high did those waves, "increasing in elevation as they advanced, and when they had attained a certain fearful height," burst open—how high did they run, and on what beach did they cast their froth of alluvian and broken stone? Even the notebook maker stands still and shivers and looks around, almost unable to put the questions down, much less the answers!

There is just one reason why no such work has been done. It wouldn't pay. There are not enough readers interested in such things as earth storms to buy a book that would describe accurately the history of such

a thing. It would cost a good deal to make the requisite surveys, the necessary borings and examinations.

What confusion exists in regard to this fourteen thousand square miles of land! So many miles are liable to be submerged, so many are above the high-water marks; so many have such and such growths upon them, so many are cleared already, and the levee is so far protective; and so far disintegrated by such and such a number of cubic feet of unexpected waters—these things are interesting, valuable, have their effect on the current market reports, and the notebook maker finds himself very deeply involved in them alone; but here and there are leads—traces and trails—which take him back into those old days when lots of things happened, around which tradition has thrown a beautiful halo, and lots of darting streaks of light, which confuse the vision.

It is convenient to assail the Government. Why go way down to Pelee, to far-off Alaska, to see if the American flag is nailed to the North Pole, with this large area, like prickly heat, so near and so marked with question points? Tie up one of those dredges digging channels at which the river pilot usually laughs, and set the crew to examining the Sunk Lands, please, Mr. Uncle Sam—so one is tempted to ask.

Three weeks ago I wrote, "It is certain the ground sank." Faithfully I had gone to old citizens, read stories, tried to get something accurate in my notebook about this region, and I was sure the ground "sank"—that the earth had really settled. To-day in Memphis I heard Robert Mitchell say that an old surveyor, who had solved the Spanish method of surveying, found their heaps of charcoal under marked trees, showing lines; and these lines, made back in the 1700s, were unchanged, though in the heart of the Sunk Lands country. The level was unchanged. What happened then? Why do the maps say "Sunk Lands"? It is a curious question, one involving some queer country—lakes where forests stood, and forests where lakes used to be. Reelfoot Lake is one of these "sunk land lakes," filled with the dead stubs of a forest.

The earthquakes are all gone, save "once in a while we have our little shakers." But when the violent shocks of 1811-12 had gone past, not only had the inhabitants become pious to a large extent, but there was a new country for many miles around New Madrid, whichever way the woodsman, most familiar with the region, chose to travel. RAYMOND S. SPEARS.

## The Story of a Horse.

SOME weeks ago Cabia Blanco told of his horse Bummer eating the army cook house slops, and of the sorrel mare that ate tobacco. I can go Cabia Blanco "one better," in that I had a horse that would do both.

I have long wanted to tell FOREST AND STREAM about Pet (that was the name of the horse that would do such an awful thing as to eat tobacco and garbage). I bought her of my brother in Jefferson county in 1865, when she was five years old. Pet was so well broken that I could leave her on the street without hitching half a day at a time, and often did so while buying wool on the street. (I was agent of a woolen mill at that time.) I often rode horseback to the mill in the morning, and on the way home at noon would stop at my office on Main street, when I would throw the reins of the bridle over the back of the saddle. My brother, who occupied the store in which I had my office, knew Pet's failings for tobacco, and would go out and "give her a chew." The store adjoining was a tobacco store, whose proprietor also had acquired the habit of treating Pet. So, when she was left unhitched under saddle in front of the two stores, and her friends failed to make the usual donation after a reasonable time, she would step across the sidewalk to the tobacco store (she knew by the smell) and nose the door handle until the proprietor "gave her a chew" and put her in the street, where she would wait for me. But should I remain longer than what seemed a reasonable time to her, she would walk up the street and turn the corner and stop at the News room, where I always stopped to get my paper. After waiting for me a few minutes, she would go across the street in the alley, where there was a pile of dry-goods boxes, which she would nose and lick. When I had gotten my paper and started for the post-office, I would snap my whip and say, "Come, Pet," and when I came out of the office she would be standing at the curb for me to mount.

Pet had another habit that I have never known another horse to have. When driven to a sleigh during a heavy fall of snow, if left standing on the street, she would lie down in the snow. She would not try to roll. One morning when on my way to the mill, I left her standing at the side entrance of the bank while I was inside. A friend saw the mare lie down in a foot of fresh snow. He put his head in the door and said, "Davison, your horse is down." I told him that it was all right; she would get up when she got ready. When I went out she got up, shook herself, and was ready to go when I got in the sleigh. She did this many times and never broke a thill or disarranged the harness.

Pet was a good stepper, and I could "lay out" all the fast horses on East avenue and on the ice of the Erie Canal.

I must tell of my first hunting trip with Pet within a month after I got her. It was the first day of quail shooting, Oct. 20. I had a fine cocker spaniel that a friend had brought from England. Pet, Karo, and I, all in the new buggy, hied away to seventy-five acres of land about nine miles from the city that I had acquired in June, at which time I had heard and saw many Bob Whites, which I concluded went with the land. After putting Pet in the small log barn on the place, Karo and I started out to gather in some of the game, but succeeded in getting only three quail and one grouse when it commenced to rain, and we returned to keep Pet company for some hours, when we started for home in the rain. For some reason the dog did not want to ride, and jumped out of the wagon. Pet did not propose to wait for him, and he was soon far in the rear. I stopped Pet, and when the dog came I again took

him into the wagon, only to have him jump out again a few minutes later, and he was soon left behind. Afraid that he might tire out before getting home, and that I would lose him, I again waited for him to catch up, and taking him in again, snapped the hitching strap to his collar ring and tied him to the dashboard of the wagon. I stopped to see a farmer, hitching Pet to the gate post with the halter. Before getting to the house, which was some distance from the road, I heard the dog yelling, and looking back, saw the mare humped up with her feet all together, trying to get as far away from the wagon as possible. The dog had jumped out, and as the strap was too short for him to reach the ground, he had swung around between the crossbar of the thills and the mare. Before I could get to her, she commenced to kick. I soon had the mare by the head, but could not stop her kicking until I picked up one of her forefeet. After quieting her, I stepped along to raise out the dog (which was dead). As I did so, she saw the motion, and gave one kick, which just grazed my knee and tore my trousers leg nearly off. I patted her on the hip and spoke to her, and then took the dog out without further trouble. The only damage to the wagon was a broken crossbar of the thills. The cushions, laprobe and blanket were thrown out of the wagon. After laying the dead dog in front of the mare, that she could see that he was harmless, I bound the broken crossbar and whiffletree together with the fatal hitching strap, the mare watching me the while (I never used blinds on her). The women folks came out to see what the trouble was, and asked how I was going to get home, saying that the horse "would run away and kick everything to pieces and kill me." I assured them that I would have no trouble in getting home, and I did not, and also, I never drove over that road in as quick time again. But there was lamentations on my arrival home over the sad fate of Karo.

And now comes the sequel to that tragic affair.

Before I had got my wagon repaired I made arrangements with one of the best sportsmen here for a few days' quail shooting, where I had had such hard luck. When about half way there, we heard the call of "Bob White." Hitching the mare to the fence at the roadside, and getting the dogs and guns out of the wagon, we started out to investigate. My friend had an English setter, and I procured a black pointer of the same breed as that Nessmuk wrote about in FOREST AND STREAM fifteen years after, that he had used while living in Lockport, in 1845, and of which he wrote to me.

The quail we had heard did not materialize, and we returned to the wagon. I left the loading of the dogs into the wagon to my friend, while I unhitched the mare. While I was doing so the black dog got against her heels, and then there was some "high kicking" for a time, long enough for the mare to free herself of the wagon. I held to the reins at her head, and had my hands badly cut either by the bit or the mare's teeth. The only other damage done was to the harness. After getting the harness in shape that it could be used, I tried to get the mare between the thills, but without success. A farmer and his son came to our help and drew the wagon to his barn, where I put the mare in a stall and asked him to feed and water her at noon. The farmer said that he could not do so without going in beside her, and he would not do that. I put her in another stall, where he would not have to do so.

My friend and I started out for where the farmer had told us we would find some quail. On the way my friend asked, "Davison, how are you going to get home?" I answered, "Why, I am going to ride home, of course." He said that "he would not ride behind that horse."

It was an ideal Indian summer day, and we had fine hunting. Going through an open woods, the dogs came to a point near my friend, who motioned me to come to him, when he pointed to the end of a rotten log in which lay a whole covey (at least a dozen) of quail. After watching them for a moment, he had his dog flush them. My friend made a double and I got one. We had gone but a few rods, when an enormous gray cat got up within a few feet of me and started up a tree. I did not know what it was, and I shot it before it was ten feet up the tree. We concluded that the cat was after the birds that we had found bunched in the log, and probably would have got more of them than we did had I not killed it. We found our birds in some wheat stubble, and my friend secured two. This was my second day's attempt at shooting on the wing, and my bag was not great. When we had finished the day's sport, I concluded the best shot I had made was at the cat.

When we got to the barn where we had left the mare, my friend refused to go in the yard. I put the black dog under the seat of the wagon, brought out the mare and watered her at the pump, led her to the wagon and backed her into the thills and hitched her to the wagon as if nothing had ever happened. My friend walked out a quarter of a mile, when he put his dog in with the other and climbed in beside me; and that was not the last time he rode behind her for a day's shooting.

After that experience I was afraid to leave the mare on the street on account of the dogs, and I did not conclude to invest in the black pointer breed of dogs. I secured a liver-colored pointer pup three months old and turned him in the barn to keep the mare company. At first I watched him when he went around the mare's heels, and also talked to Pet with a whip in my hand, and all went well for a couple of weeks, when I noticed that the mare's tail was getting short, which I could not account for, as I knew she did not whip it off on the wagon or sleigh.

One morning while going to the barn I heard the pup growling, and looking in the window, I saw the dog had the mare by the tail with his forefeet on her gambrels and was swinging from side to side. The mare seemed to enjoy it as well as the dog. I removed the dog to different quarters, and saved the rest of the mare's tail, and she never cared for dogs after that.

In September, 1868, Mr. James Ludlum, of Pompton, N. J., came into my office and said that he had met a Lockport man in St. Lawrence county who told him that I had a horse that I wanted to sell. I told him that

the man was mistaken, as I did not want to sell her. Mr. Ludlum then wanted to know if I would sell her. I told him that was a different matter, as it would depend on whether I got my price, which was \$500. Mr. L. wanted to see her, and then he wanted to drive her, to which I consented. I drew the wagon out of the barn, put the harness on the mare, slapped her on the hip and said, "Go on, Pet, and she went out and backed into the thills. Mr. L. asked, "Is that the way she always does it?" When all was ready, Mr. L. said that he would want to drive her pretty hard, and that he might kill her. I asked him what time he intended to leave Lockport. He said, "At 2:30." I told him that if he could kill her in two hours to go ahead. We drove out in the country three miles, crossed to another road and back to the house, and the mare never walked a rod. Mr. Ludlum got out and looked the mare over, and said, "She's all right. I am going West for two weeks, and will stop on my return and decide the matter." I did not expect to see him again; but before the two weeks expired, he came and said he would take the mare. He afterward wrote asking if I knew of a mate to her. I did not. In the winter he wrote that he had found a good mate to Pet as for looks, but she could not "foot with her." By putting Pet in front he could drive them tandem in three minutes; that Pet was as good to him as if he owned Dexter, and that he would not take \$5,000 for her. In 1881 Mr. Ludlum wrote that Pet was of age (twenty-one years), had long ago used up her mate, was yet as sound as a dollar; he was going to raise a colt from her, and if it was the right gender, was going to name it J. L. D. I never heard from him again, and I suspect that both he and Pet have long since passed away.

I owned a number of horses within the next ten years after foolishly disposing of Pet, but for "an all-around horse" Pet was worth all of them. J. L. DAVISON.  
LOCKPORT, N. Y.

## Amid the Florida Keys.

AS ONE sails from Miami to Key West, 150 miles, they rise and recede before and behind seemingly without limit as to number. From Key West far down into the southern horizon one still sees them, and if he sails up the west coast he is still embayed amid their green intricacies. Their number has never been computed. They vary in size from Key Largo, thirty miles long and of an average width of a mile, to mere atolls in the watery waste, a rock, marsh grass, turtle feed, seaweed and a few mangroves that have gained a precarious foothold in the crevices of the rock.

Not many of them are inhabited; not all are habitable, but Key Largo, Key Eliot and some of the larger keys have quite extensive plantations of pineapples, coconuts and truck fields upon them. The neat, white painted houses of the planters are usually set in a grove of stately coconut palms facing the ocean, and have a long wharf extending out into the shallow water with sail boats and now and then a launch tied to them. Small trading schooners plying between Miami and Key West call sometimes two and three a week and furnish the only means of communication with the great world outside.

On the uninhabited keys often are small huts thatched with palm leaves used by the wood cutters who come here in ancient sloops and schooners, cut the hard, generally button wood, and carry it to Key West, where it forms almost the only fuel of the inhabitants.

In the course of a three days' cruise among the keys we spent several hours on Key Elliot, one of the most populous and highly cultivated of the series. At the house of Mr. Edward Higgs, of Lemon City, Fla., we were courteously entertained by the three young men in charge of the plantation during the absence of the owner. There was a grove of 500 coconut trees with some 18,000 coconuts in sight, but the specialty is pineapples, for which the keys are peculiarly well adapted. The coconut grows in great clusters at the base of the long, graceful leaves which put out at the summit of the smooth, snake-like trunk, often sixty or seventy-five feet from the ground. As with the husk on, each nut is considerably larger than a man's head, the thirty or forty nuts borne by each tree form quite a rampart around the summit. The ripe fruit and green are often seen together.

"Did you ever drink the milk of the green coconut?" asked our guide. "It is a never failing specific for Bright's disease and all diseases of the kidneys."

He took a green nut, cut a hole in the base where it had been attached to the parent stem and inverting it poured out over a tumbler full of a clear, colorless liquid. It had a peculiar, slightly astringent taste but not unpleasant.

From the coconut grove we went for a visit to the pineries and truck fields. This took us directly across the key to the shores of Biscayne Bay. The surface is solid limestone or coral, not smooth, but sharp, corrugated, serrated, edged, fissured. Walking over it was quite difficult. Not an iota of soil was visible except a few ounces of black vegetable mould in the crevices of the rock, yet in this unpromising field were growing the most luxuriant pineapples, tomatoes, red peppers and germea corn we had ever seen. The tomato vines and red peppers were in bearing, and fairly loaded with fruit, yet our guide said that not an ounce of fertilizer had been applied. The pineapple is half an air plant and no doubt draws nourishment from the atmosphere, but how the other plants named could find sufficient food in this barren rock was one of the mysteries of nature. Mr. Higgs, whom we saw later at his home in Lemon City, told us that pineapples would exhaust the soil in about five years, but that other crops could be grown indefinitely. His explanation was that the rock was about 75 per cent. lime and organic matter and 10 per cent. phosphates, and that on this plant life thrived. Pineapples, he said, would render land worthless for other crops.

The rock is soft and pliable and is broken up for cultivation.

On the bay side was a long dock with sailboats tied to it, and a beautiful prospect across the shallow bay to Cutler on the mainland, some fifteen miles distant. This bay now affords the finest ground for sponge fishing on the coast and numerous sails of "spongers" plying their

trade dotted its wide expanse. Fishing is good, too, both in bay and ocean. There are no venomous serpents nor beasts of prey on the keys, and all the conditions that make life idyllic would seem to meet here, but when we said as much to our kind cicerone he spoiled our modern arcadia with one word, "mosquitoes." On this topic he waxed eloquent.

"There are days together when we have to stay in the house or be eaten by them," he said, "and all through the summer, unless the wind is strong, they are more or less a torment. I thought I had seen mosquitoes on the mainland, but they are nothing compared to the clouds that at times descend on the keys. Nobody knows whence they come or where they breed, but with the wind in certain quarters come they do, and then there is nothing to do but to stay in doors until a change of wind drives them away." C. B. Tonn.

## Food in the Wilderness.

Editor Forest and Stream:

When first the news came of the unknown fate of Leonidas Hubbard and his companion in the wilds of Labrador, the writer was among those who entertained no serious fears for their safety. Even when the rumor of Mr. Hubbard's death was published, he still had little doubt of their safe return sooner or later. This faith was based on the belief that a woodsman, a hunter, an angler and a writer on sport, must be familiar with woods and wilds, and must know how to meet the few real perils that beset the sportsman who has even a slight knowledge of woodcraft. Now that the sad story of death from starvation and of the terrible hardships and sufferings of the survivors, with woods and waters all around them, has come. I find it hard to realize. From many years' experience as an amateur hunter and fisherman, I am forced to the conclusion that their Indian guide was as ignorant as themselves of what any half-breed in Maine or New Brunswick understands thoroughly—the various ways of procuring sustenance wherever vegetable and animal life abounds. Even with Mr. Wallace's letter before me, it seems incredible that two intelligent sportsmen and an Indian provided with firearms, hatchets and knives, should suffer from hunger in any region where vegetation is abundant and where bears, caribou, porcupines, hares and squirrels, grouse, ptarmigan and water fowl are indigenous, and generally abundant.

I cannot but agree with the opinion expressed in your editorial in issue of 2d inst. that "the two white men and an Indian plunged fatuously into what they knew to be an unexplored wilderness, insufficiently provided, inadequately fitted with transportation for what supplies they had, and unequipped with any knowledge of woodcraft which might enable them to sustain life should their provisions be exhausted. What happened was precisely what might have been expected under these circumstances. The only bright gleam in the dismal story is the courage with which the men endured their sufferings and the unselfish devotion of each member of the party to his fellows." While agreeing with you in my admiration of these qualities, I must, without cynicism, quote the old adage which these presumptuous men forgot—*Ne sutor ultra crepidam*.

I think your readers are greatly indebted to Dr. Robert T. Morris for his letter in your issue of 2d inst., in which he gives them an invaluable lesson in woodcraft. Had poor Hubbard and his companion known even the rudiments of their business as explorers, all their sufferings could have been avoided, and Mr. H. would have returned to his many friends none the worse for his expedition.

Were the Octogenarian forty years younger he would ask nothing better than, with Dr. Morris and E. A. Samuels as companions, and Sachem Gabe and Sebastian Toma (as he knew them forty years ago) for attendants, to follow the route and seek the goal which proved so disastrous to poor Hubbard and his party. Most heartily would he echo the wish expressed by Dr. Morris, with all the longing of a true woodsman: "Give me a seat on the thick, wet caribou moss, with the sleet bouncing off the tin platter that holds some wood-rat stew, with poplar buds on the side; for a relish a seal-oil salad of brake sprouts; for dessert a handful of spice cranberries, picked on the spot, and for luxury a cup of hot tea without milk or sugar, flavored only with such an appetite as vigorous exercise and the strong, pure wind" give to the lovers of nature when in the wildest haunts of the Red Gods. There are fine days, even in the wilds of Labrador, and the pleasures of these more than compensate for all the discomforts their worst storms can cause to the woodsman who understands his craft.

I commend Dr. Morris's letter to the careful study of all who are ambitious of joining that small circle of sportsmen who can dispense with double tents, sheet-iron stoves and canvas stretchers, and who can make themselves comfortable and happy under the most adverse circumstances as long as they are surrounded by rocks and woods and within reach of lakes and streams.

THE OLD ANGLER.

SUSSEX, N. B.

## Narrows Island Club Meeting.

THE annual meeting of the Narrows Island Club was held at the Hoffman House, New York city, April 11, at 8:30 P. M.

There were present Messrs. J. B. Lawrence, W. H. Wheelock, Henry Sampson, T. S. Young, Jr., Fred. Jones, W. H. Nichols, Charles Greer, Wm. R. Peters, Geo. Bird Grinnell, Bayard Dominick, and Dr. F. Markoe.

After the reading of the reports of the secretary and treasurer and an address on the work of the past year by the president, the following officers were elected: President, J. Burling Lawrence; Secretary and Treasurer, Wm. H. Wheelock; Vice-President, Henry Sampson; Executive Committee, T. S. Young, Jr., Fred Jones, R. H. Robertson, Geo. B. Grinnell, and the officers.

The address of the president showed the present shooting season to have been the most successful except one in the club's history. Only in the season of 1885-1886 were more birds killed. The grounds of the Narrows Island Club are in Currituck County, N. C.

## Natural History.

### Preservation of the Wild Animals of North America.\*

BY HENRY FAIRFIELD OSBORN.

THE National and Congressional movement for the preservation of the Sequoia in California represents a growth of intelligent sentiment. It is the same kind of sentiment which must be aroused, and aroused in time, to bring about Government legislation if we are to preserve our native animals. That which principally appeals to us in the Sequoia is its antiquity as a race, and the fact that California is its last refuge.

As a special and perhaps somewhat novel argument for preservation, I wish to remind you of the great antiquity of our game animals, and the enormous period of time which it has taken nature to produce them. We must have legislation, and we must have it in time. I recall the story of the judge and jury who arrived in town and inquired about the security of the prisoner, who was known to be a desperate character; they were assured by the crowd that the prisoner was perfectly secure because he was safely hanging to a neighboring tree. If our preservative measures are not prompt, there will be no animals to legislate for.

#### Sentiment and Science.

The sentiment which promises to save the Sequoia is due to the spread of knowledge regarding this wonderful tree, largely through the efforts of the Division of Forestry. In the official chronology of the United States Geological Survey—which is no more nor less reliable than that of other geological surveys, because all are alike mere approximations to the truth—the Sequoia was a well developed race 10,000,000 of years ago. It became one of a large family, including fourteen genera. The master genus—the Sequoia—alone includes thirty extinct species. It was distributed in past times through Canada, Alaska, Greenland, British Columbia, across Siberia, and down into southern Europe. The Ice Age, and perhaps competition with other trees more successful in seeding down, are responsible for the fact that there are now only two living species—the "red wood," or *Sequoia sempervirens*, and the giant, or *Sequoia gigantea*. The last refuge of the *gigantea* is in ten isolated groves, in some of which the tree is reproducing itself, while in others it has ceased to reproduce.

In the year 1900 forty mills and logging companies were engaged in destroying these trees.

All of us regard the destruction of the Parthenon by the Turks as a great calamity; yet it would be possible, thanks to the laborious studies which have chiefly emanated from Germany, for modern architects to completely restore the Parthenon in its former grandeur; but it is far beyond the power of all the naturalists of the world to restore one of these Sequoias, which were large trees, over 100 feet in height, spreading their leaves to the sun, before the Parthenon was even conceived by the architects and sculptors of Greece.

#### Life of the Sequoia and History of Thought.

In 1900 five hundred of the very large trees still remained, the highest reaching from 320 to 325 feet. Their height, however, appeals to us less than their extraordinary age, estimated by Hutchins at 3,600, or by John Muir, who probably loves them more than any man living, at from 4,000 to 5,000 years. According to the actual count of Muir of 4,000 rings, by a method which he has described to me, one of these trees was 1,000 years old when Homer wrote the Iliad; 1,500 years of age when Aristotle was foreshadowing his evolution theory and writing his history of animals; 2,000 years of age when Christ walked upon the earth; nearly 4,000 years of age when the "Origin of Species" was written. Thus the life of one of these trees spanned the whole period before the birth of Aristotle (384 B. C.) and after the death of Darwin (A. D. 1882), the two greatest natural philosophers who have lived.

These trees are the noblest living things upon earth. I can imagine that the American people are approaching a stage of general intelligence and enlightened love of nature in which they will look back upon the destruction of the Sequoia as a blot on the national escutcheon.

#### Veneration of Age.

The veneration of age sentiment which should, and I believe actually does, appeal to the American people when clearly presented to them even more strongly than the commercial sentiment, is roused in equal strength by an intelligent appreciation of the race longevity of the larger animals which our ancestors found here in profusion, and of which but a comparatively small number still survive. To the unthinking man a bison, a wapiti, a deer, a pronghorn antelope, is a matter of hide and meat; to the real nature lover, the true sportsman, the scientific student, each of these types is a subject of intense admiration. From the mechanical standpoint they represent an architecture more elaborate than that of Westminster Abbey, and a history beside which human history is as of yesterday.

#### Slow Evolution of Modern Mammals.

These animals were not made in a day, nor in a thousand years, nor in a million years. As said the first Greek philosopher, Empedocles, who 560 B. C. adumbrated the "survival of the fittest" theory of Darwin, they are the result of ceaseless trials of nature. While the Sequoia was first emerging from the Carboniferous, or Coal Period, the reptile-like ancestors of these mammals, covered with scales and of egg-laying habits, were crawling about and giving not the most remote prophecy of their potential transformation through 10,000,000 of years into the superb fauna of the northern hemisphere.

The descendants of these reptiles were transformed into mammals. If we had had the opportunity of studying the early mammals of the Rocky Mountain region with a full appreciation of the possibilities of evolution, we

\*Address before the Boone and Crockett Club, Washington.

should have perceived that they were essentially of the same stock and ancestral to our modern types. There were little camels scarcely more than twelve inches high, little taller than cotton-tail rabbits, and smaller than the jackass rabbits; horses fifteen inches high, scarcely larger than, and very similar in build to, the little English coursing hound known as the whippet; it is not improbable that we shall find the miniature deer; there certainly existed ancestral wolves and foxes of similarly small proportions. You have all read your Darwin carefully enough to know that neither camels, horses, nor deer would have evolved as they did except for the stimulus given to their limb and speed development by the contemporaneous evolution of their enemies in the dog family.

#### The Middle Stage of Evolution.

A million and a half years later these same animals had attained a very considerable size; the western country had become transformed by the elevation of the plateaux into dry, grass-bearing uplands, where both horses and deer of peculiarly American types were grazing. We have recently secured some fresh light on the evolution of the American deer. Besides the *Paleomerus*, which may be related to the true American deer *Odocoileus*, we have found the complete skeleton of a small animal named *Merycodus*, nineteen inches high, possessed of a complete set of delicate antlers with the characteristic burr at the base indicating the annual shedding of the horn, and a general structure of skeleton which suggests our so-called pronghorn antelope, *Antilocapra*, rather than our true American deer, *Odocoileus*. This was in all probability a distinctively American type. Its remains have been found in eastern Colorado in the geological age known as Middle Miocene, which is estimated (*sub rosa*, like all our other geological estimates), at about a million and a half years of age. Our first thought as we study this small, strikingly graceful animal, is wonder that such a high degree of specialization and perfection was reached at so early a period; our second thought is the reverence for age sentiment.

#### The African Period in America.

The conditions of environment were different from what they were before or what they are now. These animals flourished during the period in which western America must have closely resembled the eastern and central portions of Africa at the present time.

This inference is drawn from the fact that the pre-dominant fauna of America in the Middle and Upper Miocene Age and in the Pliocene was closely analogous to the still extant fauna of Africa. It is true we had no real antelopes in this country, in fact none of the bovines, and no giraffes; but there was a camel which my colleague Matthews has surnamed the "giraffe camel," extraordinarily similar to the giraffe. There were no hippopotami, no hyraxes. All these peculiarly African animals, of African origin, I believe, found their way into Europe at least as far as the Sivalik Hills of India, but never across the Bering Sea Isthmus. The only truly African animal which reached America, and which flourished here in an extraordinary manner, was the elephant, or rather the mastodon, if we speak of the elephant in its Miocene stage of evolution. However, the resemblance between America and Africa is abundantly demonstrated by the presence of great herds of horses, of rhinoceroses, both long and short limbed, of camels in great variety, including the giraffe-like type which was capable of browsing on the higher branches of trees, of small elephants, and of deer, which in adaptation to somewhat arid conditions imitated the antelopes in general structure.

#### Elimination by the Glacial Period.

The Glacial Period eliminated half of this fauna, whereas the equatorial latitude of the fauna in Africa saved that fauna from the attack of the Glacial Period, which was so fatally destructive to the animals in the more northerly latitudes of America. The glaciers, or at least the very low temperature of the period, eliminated especially all the African aspects of our fauna. This destructive agency was almost as baneful and effective as the mythical Noah's flood. When it passed off, there survived comparatively few indigenous North American animals, but the country was repopulated from the entire northern hemisphere, so that the magnificent wild animals which our ancestors found here were partly North American and partly Eurasiatic in origin.

#### Elimination by Man.

Our animal fortune seemed to us so enormous that it never could be spent. Like a young rake coming into a very large inheritance, we attacked this noble fauna with characteristic American improvidence, and with a rapidity compared with which the Glacial advance was eternally slow; the East went first, and in fifty years we have brought about an elimination in the West which promises to be even more radical than that effected by the ice. We are now beginning to see the end of the North American fauna; and if we do not move promptly, it will become a matter of history and of museums. The bison is on the danger line; if it survives the fatal effects of its natural sluggishness when abundantly fed, it still runs the more insidious but equally great danger of inbreeding, like the wild ox of Europe. The chances for the wapiti and elk and the western mule and black-tail deer are brighter, provided that we move promptly for their protection. The pronghorn is a wonderfully clever and adaptive animal, crawling under barb-wire fences, and thus avoiding one of the greatest enemies of Western life. Last summer I was surprised beyond measure to see the large herds of twenty to forty pronghorn antelopes still surviving on the Laramie plains, fenced in on all sides by the wires of the great Four-Bar Ranch, part of which I believe are stretched illegally.

#### Recent Disappearance.

I need not dwell on the astonishingly rapid diminution of our larger animals in the last few years; it would be like "carrying coals to Newcastle" to detail personal observations before this Club, which is full of men of far greater experience and knowledge than myself. On the White River Plateau Forest Reserve, which is destined to be the Adirondacks of Colorado, with which many of

you are familiar, the deer disappeared in a period of four years. Comparatively few are left.

The most thoroughly devastated country I know of is the Uintah Mountain Forest Reserve, which borders between southwestern Wyoming and northern Utah. I first went through this country in 1877. It was then a wild natural region; even a comparatively few years ago it was bright with game, and a perfect flower garden. It has felt the full force of the sheep curse. I think any one of you who may visit this country now will agree that this is not too strong a term, and I want to speak of the sheep question from three standpoints: First, as of a great and legitimate industry in itself; second, from the economic standpoint; third, from the standpoint of wild animals.

#### General Results of Grazing.

The formerly beautiful Uintah Mountain range presents a terrible example of the effects of prolonged sheep herding. The under foliage is entirely gone. The sheep annually eat off the grass tops and prevent seeding down; they trample out of life what they do not eat; along the principal valley routes even the sage brush is destroyed. Reforesting by the upgrowth of young trees is still going on to a limited extent, but is in danger. The water supply of the entire Bridger farming country, which is dependent upon the Uintah Mountains as a natural reservoir, is rapidly diminishing; the water comes in tremendous floods in the spring, and begins to run short in the summer, when it is most needed. The consequent effects upon both fish and wild animals are well known to you. No other animal will feed after the sheep. It is no exaggeration to say, therefore, that the sheep in this region are the enemies of every living thing.

#### Balance of Nature.

Even the owner cannot much longer enjoy his range, because he is operating against the *balance of nature*. The last stage of destruction which these innocent animals bring about has not yet been reached, but it is approaching; it is the stage in which there is *no food left for the sheep themselves*. I do not know how many pounds of food a sheep consumes in course of a year—it cannot be much less than a ton—but say it is only half a ton, how many acres of dry western mountain land are capable of producing half a ton a year when not seeding down? As long as the consumption exceeds the production of the soil, it is only a question of time when even the sheep will no longer find subsistence.

#### The Last Stage to be Seen in the Orient.

While going through these mountains last summer and reflecting upon the prodigious changes which the sheep have brought about in a few years, it occurred to me that we must look to Oriental countries in order to see the final results of sheep and goat grazing in semi-arid climates. I have proposed as an historical thesis a subject which at first appears somewhat humorous, namely, "The Influence of Sheep and Goats in History." I am convinced that the country lying between Arabia and Mesopotamia, which was formerly densely populated, full of beautiful cities, and heavily wooded, has been transformed less by the action of political causes than by the unrestricted browsing of sheep and goats. This browsing destroyed first the undergrowth, then the forests, the natural reservoirs of the country, then the grasses which held together the soil, and finally resulted in the removal of the soil itself. The country is now denuded of soil, the rocks are practically bare; it supports only a few lions, hyenas, gazelles, and Bedouins. Even if the trade routes and mines, on which Brooks Adams in his "New Empire," dwells so strongly as factors of all civilization, were completely restored, the population could not be restored nor the civilization, because there is nothing in this country for people to live upon. The same is true of North Africa, which, according to Gibbon, was once the granary of the Roman Empire. In Greece today the goats are now destroying the last vestiges of the forests.

I venture the prediction that the sheep industry on naturally semi-arid lands is doomed; that the future feeding of both sheep and cattle will be on irrigated lands, and that the forests will be carefully guarded by State and Nature as natural reservoirs.

#### Commercialism and Idealism.

By contrast to the sheep question, which is a purely economic or utilitarian one, and will settle itself, if we do not settle it by legislation based on scientific observation, the preservation of the Sequoia and of our large wild animals is one of pure sentiment, of appreciation of the ideal side of life; we can live and make money without either. We cannot even use the argument which has been so forcibly used in the case of the birds, that the cutting down of these trees or killing of these animals will upset the balance of nature.

I believe in every part of the country—East, West, North, and South—we Americans have reached a stage of civilization where if the matter were at issue the majority vote would unquestionably be, *let us preserve our wild animals*.

We are generally considered a commercial people, and so we are; but we are more than this, we are a people of ideas, and we value them. As stated in the preamble of the Sequoia bill introduced on December 8, 1903, we must legislate for the benefit and enjoyment of the people, and, I may add, for the greatest happiness of the largest number, not only of the present but of future generations.

So far as my observation goes, preservation can only be absolutely insured by national legislation.

#### Government Legislation by England, Belgium, Germany.

The English, a naturally law-abiding people, seem to have a special faculty for enforcing laws. By co-operation with the Belgian Government they have taken effective and remarkably successful measures for the protection of African game. As for Germany, in 1896 Mr. Gosselin, of the British Embassy in Berlin, reported as follows for German East Africa:

That the question of preserving big game in German East Africa has been under the consideration of the local authorities for some time past, and a regulation has been notified at Dar-es-Salaam which it is hoped will do something toward checking

the wanton destruction of elephants and other indigenous animals. Under this regulation every hunter must take out an animal license, for which the fee varies from 5 to 500 rupees, the former being the ordinary fee for natives, the latter for elephant and rhinoceros hunting, and for the members of sporting expeditions into the interior. Licenses are not needed for the purpose of obtaining food, nor for shooting game damaging cultivated land, nor for shooting apes, beasts of prey, wild boars, reptile, and all birds except ostriches and cranes. Whatever the circumstances, the shooting is prohibited of all young game—calves, foals, young elephants, either tuskless or having tusks under three kilos, all female game if recognizable—except, of course, those in the above category of unprotected animals. Further, in the Mosehi district of Kilima-Njaro, no one, whether possessing a license or not, is allowed without the special permission of the Governor to shoot antelopes, giraffes, buffaloes, ostriches, and cranes. Further, special permission must be obtained to hunt these with nets, by kindling fires, or by big drives. Those who are not natives have also to pay 100 rupees for the first elephant killed, and 250 for each additional one, and 50 rupees for the first rhinoceros and 150 for each succeeding one. Special game preserves are also to be established, and Major von Wissmann, in a circular to the local officers, explains that no shooting whatever will be allowed in these without special permission from the Government. The reserves will be of interest to science as a means of preserving from extirpation the rarer species, and the Governor calls for suggestions as to the best places for them. They are to extend in each direction at least ten hours' journey on foot. He further asks for suggestions as to hippopotamus reserves, where injury would not be done to plantations. Two districts are already notified as game sanctuaries. Major von Wissmann further suggests that the station authorities should endeavor to domesticate zebras (especially when crossed with mules and other asses and horses), ostriches, and hyena dogs crossed with European breeds. Mr. Gosselin remarks that the best means of preventing the extermination of elephants would be to fix by international agreement among all the Powers on the East African coast a close time for elephants, and to render illegal the exportation or sale of tusks under a certain age.

In December, 1900, Viscount Cranborne in the House of Commons reported as follows:

\* \* \* That regulations for the preservation of wild animals have been in force for some time in the several African Protectorates administered by the Foreign Office, as well as in the Sudan. The obligations imposed by the recent London Convention upon the signatory Powers will not become operative until after the exchange of ratifications, which has not yet taken place. In anticipation, however, steps have been taken to revise the existing regulations in the British Protectorates so as to bring them into strict harmony with the terms of the convention. The game reserves now existing in the several Protectorates are: In (a) British Central Africa, the elephant marsh reserve and the Shirwa reserve; in (b) the East Africa Protectorate, the Kenia District; in (c) Uganda, the Sugota game reserve in the northeast Protectorate; in (d) Somaliland, a large district defined by an elaborate boundary line described in the regulations. The regulations have the force of law in the Protectorates, and offenders are dealt with in the Protectorate Courts. It is in contemplation to charge special officers of the Administration with the duty of watching over the proper observance of the regulations. Under the East African game regulations only the officers permanently stationed at or near the Kenia reserve may be specially authorized to kill game in the reserve.

Other effective measures have been taken in the Sudan district. Capt. Stanley Flower, Director of the Gizeh Zoological Gardens, made a very full report, which is quoted in Nature for July 25, 1901, p. 318.

#### State Laws.

The preservation of even a few of our wild animals is a very large proposition; it is an undertaking the difficulty of which grows in magnitude as one comes to study it in detail and gets on the ground. The rapidly increasing legislation in the Western States is an indication of rapidly growing sentiment. A still more encouraging sign is the strong sympathy with the enforcement of the laws which we find around the National Park in Wyoming and Montana especially. State laws should be encouraged, but I am convinced that while effective in the East, they will not be effective in the West in time, because of the scattered population, the greater areas of country involved, the greater difficulty of watching and controlling the killing, and the actual need of game for food by settlers.

When we study the operation of our State laws on the ground we find that for various reasons they are not fully effective. A steady and in some cases rapid diminution of animals is going on, so far as I have observed, in Colorado and Wyoming; either the wardens strictly enforce the laws with strangers and wink at the breaking of them by residents, or they draw their salaries and do not enforce the laws at all.\*

\*Addendum.—There is no question as to the good intention of State legislation. The chief difficulty in the enforcement of the law is that officers appointed locally, and partly from political reasons, shrink from applying the penalties of the law to their own friends and neighbors, especially where the animals are apparently abundant and are sought for food. The honest enforcement of the law renders the officer unpopular, even if it does not expose him to personal danger. He is regarded as interfering with long established rights and customs. The above applies to conscientious officers. Many local game wardens, as in the Colorado White River Plateau, for example, give absolutely no attention to their duties, and are not even on the ground at the opening of the season. In the Plateau in August, 1901, the laws were being openly and flagrantly violated, not only by visitors, but by residents. At the same time the National forest laws were being most strictly and intelligently enforced. There is no question whatever that the people of various States can be brought to understand that National aid or co-operation in the protection of certain wild areas is as advantageous to a locality as National irrigation and National forest protection. It is to be sought as a boon and not as an infringement.

#### The Various Causes of Elimination.

The enemies of our wild animals are numerous and constantly increasing. (1) There is first the general advance of what we call civilization, the fencing up of country which principally cuts off the winter feeding grounds. This was especially seen in the country south of the National Park last winter. (2) The destruction of natural browsing areas by cattle and sheep, and by fire. (3) The destruction of game by sportsmen plays a comparatively small part in the total process of elimination, yet in some cases it is very reckless, and especially bad in its example. When I first rode into the best shooting country of Colorado in 1901, there was a veritable cannonading going on, which reminded me of the accounts of the battle of El Caney. The destruction effected by one party in three days was tremendous. In riding over the ground—for I was not myself shooting—I was constantly coming across the carcasses of deer. (4) The summer and winter killing for food; this is the principal and in a sense the most natural and legitimate cause, although it is largely illegal. In this same area, which was more or less characteristic and typical of the other areas, even of the conditions surrounding the national reserve in the Big Horn region, the destruction was, and is, going on principally during the winter when the deer are seeking the winter ranges, and when they are actually shot and carted away in large numbers for food both for the ranchmen and for neighboring towns. Making all

allowances for exaggeration, I believe it to be absolutely true that these deer were being killed by the wagonload! The same is true of the pronghorn antelope in the Laramie Plains district. The most forceful argument against this form of destruction is that it is extremely short-lived and benefits comparatively few people. This argument is now enforced by law and by public sentiment in Maine and New York, where the wild animals, both deer and moose, are actually increasing in number.

Granted, therefore, that we have both National and State sentiment, and that National legislation by co-operation with the States, if properly understood, would receive popular support, the carrying out of this legislation and making it fully effective will be a difficult matter.

It can be done, and, in my judgment, by two measures. The first is entirely familiar to you: certain or all of the forest reserves must be made animal preserves; the forest rangers must be made game wardens, or special wardens must be appointed. This is not so difficult, because the necessary machinery is already at hand, and only requires adaptation to this new purpose. It can probably be carried through by patience and good judgment. Second, the matter of the preservation of the winter supply of food and protection of animals while enjoying this supply is the most difficult part of the whole problem, because it involves the acquisition of land which has already been taken up by settlers and which is not covered by the present forest reserve machinery, and which I fear in many instances will require new legislation.

Animals can change their habits during the summer, and have already done so; the wapiti, buffalo, and even the pronghorn have totally changed their normal ranges to avoid their new enemy; but in winter they are forced by the heavy snows and by hunger right down into the enemy's country.

Thus we not only have the problem of making game preserves out of our forest reserves, but we have the additional problem of enlarging the area of forest reserves so as to provide for winter feeding. If this is not done all the protection which is afforded during the summer will be wholly futile. This condition does not prevail in the East, in Maine and in the Adirondacks, where the winter and summer ranges are practically similar. It is, therefore, a new condition and a new problem.

Greater difficulties have been overcome, however, and I have no doubt that the members of this Club will be among the leaders in the movement. The whole country now applauds the development and preservation of the Yellowstone Park, which we owe largely to the initiative of Phillips, Grinnell, and Rogers. Grant and La Farge were pioneers in the New York Zoological Park movement. We know the work of Merriam and Wadsworth, and we always know the sympathies of our honored founder, member, and guest of this evening, Theodore Roosevelt.

What the Club can do is to spread information and thoroughly enlighten the people, who always act rightly when they understand.

It must not be put on the minutes of the history of America, a country which boasts of its popular education, that the *Sequoia*, a race 10,000,000 years old, sought its last refuge in the United States, with individual trees older than the entire history and civilization of Greece, that an appeal to the American people was unavailing, that the finest grove was cut up for lumber, fencing, shingles, and boxes! It must not be recorded that races of animals representing stocks 3,000,000 years of age, mostly developed on the American continent, were eliminated in the course of fifty years for hides and for food in a country abounding in sheep and cattle.

The total national investment in animal preservation will be less than the cost of a single battleship. The end result will be that a hundred years hence our descendants will be enjoying and blessing us for the trees and animals, while, in the other case, there will be no vestige of the battleship, because it will be entirely out of date in the warfare of the future.

#### Tanawadeh Outing Club Dines.

THE second annual dinner of the Tanawadeh Outing Club was held at The Arena, Broadway and Thirty-first street, New York, on April 9. The following officers and members were present: President, F. James Reilly; Vice-President, J. Frank Case; Secretary, Harry V. Radford; Treasurer, Joseph B. Hanf; John F. Curry, S. Valentine Farrelly, Francis W. Norris, Jr., Joseph E. Ridder, William F. Reilly and Charles Stepath. The menus were in the form of pyramidal tents, composed of regular army duck, upon untying and opening which was disclosed the list of viands, printed in the club colors, sky-blue and marine, and ornamented with sketches emblematic of the out-of-doors life to which the members were so enthusiastically devoted. The following toasts were responded to: "Allurements of the Out-door Life," J. Frank Case; "Our Club—Its Aims and Objects," Joseph E. Ridder; "True Sportsmanship," Harry V. Radford; "Campfire Fantasies," William F. Reilly; "The Ninth Annual Outing," S. Valentine Farrelly.

The Tanawadeh Outing Club was organized in 1896 primarily with the object of encouraging out-door sports and promoting good fellowship among its members. The membership limit is twenty.

A CHICAGO professor has the petrified form of a fish sixteen feet long. It will be recognized at once by many truthful anglers as the one that got away when they were about to haul it into the boat.—Chicago News.

Secretary Taft does not pretend to be much of a soldier, and has to take a good many jokes on his incomplete knowledge of military matters. Last night at the banquet of the Virginia Military Institute men he made a speech on the War Department in which he humorously disclaimed any particular acquaintance with the ways of the army. "When I was on my way home from Manila," he said, "I stopped in Japan, where I was invited to inspect the Japanese Army. I did so, and told the officers the army was all right. As a matter of fact, I was trembling in my boots, all the time for fear some one would ask me what was the caliber of a Krag-Jorgensen rifle."—New York Times.

## Confessions of a Dog Borrower.

AND this is about as he tells it—

"I was about to take a shooting trip up near Winnipeg, having received word from my brother that the sharp-tail grouse were more than plentiful in the freshly cut stubble. But I had no dog, and dog I must have, beg, borrow, buy or steal.

"I firstly went to the ammunition store and selected my supply of shells, and the storekeeper, in conversation, wormed out of me the fact that I had no dog. I told him, however, I was about to buy one. 'Buy an untried dog! Why, no man in his senses does that. Shoot over him first and then if you like him buy him, but not otherwise. Hire a dog if you will and buy him afterward. Yes, I can tell you where you can hire a dog. I'll send word to the party and he'll call on you.'

"The time was short, as I was to leave Saturday evening for the north. But the man turned up, extolled his dog to the skies, offered to loan it for a moderate figure, and said I could buy the dog if I wished to, after a trial, for \$75. He promised the dog would be at the depot early on Saturday, so I could look him over before I started.

"Saturday rolled around and an hour before train time I was notified that the dog was at the depot. I thought it over and feel it now was a groundhog case. That dog had to suit. I saw the dog and was not impressed with him. He fought shy of me, growled, and was anything but an amiable dog. The owner, however, assured me that on acquaintance he would improve and would be found docile, kind, obedient, affectionate and an all around fine dog.

"I spent most of my time in the baggage car en route for Winnipeg getting acquainted with that dog, but it was slow work. However, arrived at my station I found my brother awaiting me with his team, so bundling dog, gun, baggage and shells into the rig we started off. It was early in the afternoon and as we made short cuts over prairie and wheat stubble we began to see birds. The dog became restless, and we decided to let him out. And we did. And he took the back track. We knew he would follow the road straight back to Winnipeg, and by making a short cut we were able to intercept him. We caught the dog and now tied him to the hind axle of the rig. We reached my brother's farm, petted the dog (keeping him tied up, however), fed him on fresh milk and chicken bones and felt that having introduced him to a good thing he would remain by us. He was unloosed and followed us around and at nightfall we locked him in the barn.

"The birds were, to say the least, numerous, and we could see them in the stubble and hear them as they flushed with a coo-coo-coo-coo!!!

"The rig was harnessed up, a fine lunch packed away and a large stone jug filled with cool spring water placed where it could be handy. Then off we started—and the moment we released the dog off he started, slowly and cautiously at first, until apparently conscious that he was beyond gunshot, when off he loped, flushing birds right and left in his course, and the last we saw of him was the tip of his tail as he crossed a hill far to the north. He never came back, and for all I know is going yet. What hunting I did was done *per se*, walking up my birds in the stubble and kicking around in the prairie grass and now and then flushing one. My trip was spoiled.

"When I returned to town the owner of the dog called on me and asked me how I liked him. I told my story and it is needless to say that the same was listened to with much evident incredulity mingled with surprise. 'Wasn't a better dog in the country?' 'Must have abused him.' 'Never knew him to act that way before.' The conversation ending up with a request to produce the dog or hand over the agreed price, \$75. And to make a long story short, after much correspondence and some very warm interviews I sent the fellow a check for \$30 and considered the incident closed."

"The months rolled by when once more did the chicken season arrive. I again went to the gun store and whom should I meet there but the man who had sold me the lost (and—very likely as far as he was concerned—the stolen dog). I lost no time in telling him in good Queen's English and otherwise just what I thought of him. He bore it with surprising meekness, and when I halted for breath he started in by telling me of another dog that he had. He had his pedigree on the tip of his tongue. It was a long one, beginning at the kennels of Nimrod and coming down to date. This was a dog that was a dog. A nose that would scent a chicken a mile off if the wind was right. Broken to a T and trained to a knife edge. This was a \$100 dog, not a \$75 one. This one he guaranteed to give satisfaction or no sale. I could take him and try him and if he did not suit no charge would be made for his hire.

"And I took the dog on trial. I found him more

sociable than the former one, and my hopes were elevated, to say the least. We arrived at the grounds at dark and made an early morning start. He commenced to range and work beautifully. The birds got up and as we fired the dog broke and made off as if the devil were after him for the main road. We sought our rig and gave chase and when within seventy or eighty yards, in desperation, I let go at him. Instantly he put his tail between his legs and turned in his tracks and loped toward us, coming beautifully to heel, as it were. There were no shot marks in his hindquarters. He acted like a dog that was sorry and would try to do better. And we worked back to the field and he again began to work with nose to the ground, when all of a sudden he threw his head high in the air, as if scenting the birds from afar, and started off at a steady lope. There were fences here and there and we must follow him afoot, which we did as best we could. We cut around a hill, thinking to intercept him at the road, but he was a little too swift for us and was already loping up the road towards a farm house. We felt hopeful that he would stop there perhaps for a drink at the pump when we could once more get possession of him.

"But, alas! out from the farm's yard came three great nondescript dogs, scrappers, every one of them, snarling and growling as if they meant business. Our dog stood not on the order of his going, but, assuming a jack-rabbit gait, turned to the right and made little of fence, ditch or plowed field and was out of sight in a jiffy. Gone, but not forgotten. I thought of a combination of things, in which a hundred dollars was somehow inextricably mixed up with pedigrees, guarantees, etc., etc.

"The dog artist kept out of my way and I have not laid eyes on him since, but a few days ago a letter from an attorney at law was received by me demanding \$100 or the return of the dog and suggesting a prompt remittance and thus avoiding further trouble and expense.

"And, going to my lawyer, he has written the other lawyer that if he made a single move to commence suit his client would get all the law he wanted, and more. And I am waiting for further developments."

CHARLES CRISTADORO.

## Life in the Woods.

### VII.—How We Hunted.

PERHAPS the reader, who has followed through the tortuous wanderings of this disjointed narrative, will pardon a brief digression at this point for the purpose of explaining what may have been already guessed, namely, the methods used by our party in hunting. With the location selected and the camp arrangements completed, the next thing has always been to examine well the ground and find out as soon as possible the haunts and runways of the deer, make our own trails or reblaze the old ones so that the more inexperienced might have convenient routes to travel over to camp from certain given points. Around the old choppings, along the old logging roads and about the swamps, as a rule, are found the best hunting grounds, as in the one place the clover and grass have sprung up making good feed and in the other there is abundant cover. During the first few days of the hunt, when on new ground, it has been the rule for each one to explore by himself until he became thoroughly acquainted with the country and able to travel in every direction with not any fear of becoming lost. The feeding ground once located, a number of places have always been found where different ones could take their stands at early morning or at twilight and watch the movements of the deer, sometimes securing in this way many a good shot and oftentimes bringing down a fine deer. Another favorite method with us is to find the hiding places of the deer and their runways and then place some of the party on these runways while the others go around and drive the game from the cover. When started the deer usually take the runways and the watcher is rewarded with a shot, and generally this method has been attended with considerable luck.

A large island in the Menominee River was one favorite place for such "drives," as we called them. I can remember the time when four of the party went there and commencing at the lower end spread out hunting abreast of each other for quite a distance. One of the boys on the left discovered some large deer tracks in the light snow and leading into a large patch of thick brush. A consultation was called and it was arranged for three of the party to take stands on some ridges, which partially surrounded the brush, while one should go in and start the deer. As soon as the watchers had taken their stands the driver went in and soon the sound of his voice was heard calling "Look out, he's coming," and sure enough, there came bounding up the hill a right royal buck, with head and tail erect. As he came leaping over the brush he

looked more like an elk than a deer, but as he neared one of the stands a fortunate shot brought him to the ground, and when examined by the party he was pronounced one of the largest deer ever killed in northern Wisconsin, as it was estimated he would weigh over 300 pounds. At the same time two other deer were started from the same cover, but they succeeded in escaping. Another method of hunting is for each to take his selected territory and still-hunt through the woods, keeping a sharp lookout for whatever can be seen. By this method many deer have been killed, especially by the older members of the party, who are experts in that style of hunting.

It was when the first fall of snow came that they excelled in this kind of work, for at early morn they would start out, take a fresh track and follow it all day, if necessary, but finally get their game. In taking a track this way the deer, when first started, usually puts off at a lively gait, but as a rule soon slows down when he finds that he is not being hurried any. Sometimes he will keep this up for quite a time, but as a rule, after having been started a number of times, unless it is an unusually wary old buck or doe, they gradually become careless, start slower and when started run slower, soon dropping into a walk. Perhaps the first four or five times a deer is started in this way, or maybe even more, not even a glimpse of him will be obtained, but sooner or later he will begin to lag and every now and then the patient, careful hunter will be rewarded by the sight of a flash of gray disappearing over the top of a ridge or into the brush. It is then that the greatest care must be exercised, and at this time experience in the ways of deer and a natural ability to judge the country becomes of great service, the former in watching the track closely and judging whether the game is still alert or whether it is showing a disposition to stop and watch or lie down, the latter in determining which way the deer is most liable to turn, so that a short cut will head it off, where it is most liable to stand and watch for you or to lie down and sun itself. Many a time I have known the old hunters in our party, when following a deer, to suddenly start off at right angles to the track and hurry to some ridge or edge of a swamp, there to catch their game traveling along wholly unsuspecting of their presence. A gentle "bah" or a low whistle and the next second a bullet crashes through him. Many a time have I known them to follow so carefully and persistently and watchfully that on the sunny side of some ridge they would catch their deer in his bed and kill him before he had time to rise, and then again on several occasions I have known them to meet the object of their pursuit face to face as he was coming back on his back track, in hopes of throwing his pursuers off. Success is not always with one in this style of hunting, for deer, when once they realize that you are after them, are not as silly as some may think. At the outset they will oftentimes be started two or three times, but finally assured that they are being followed they will put off at a dead run and perhaps not stop short of two or three miles and perhaps more. As often, too, they will run over their track two or three times, then take a big jump off sideways, and more frequently they will herd in with other deer and make it next to impossible for any particular track to be followed. So that success does not by any means always attend efforts of this kind. On the contrary, it requires more than the average strength and activity to stand the strain of such a chase. One must be able to go far and still be strong enough and supple enough to step over logs carefully and to avoid breaking any brush and at the same time be able to cover a long distance quickly if necessary. It requires mental vigor also, for one must be constantly on the alert and have his mind entirely on the pursuit, for one careless moment may lose to you the only chance for success of the day. It is a hard way, to hunt and one in which the beginner is rarely successful. To prowl through the woods watching on a runway now and then is more enjoyable and not nearly as hard and then, too, one's ambition will not crowd him to stay out and overdo when he should be, for his own health, resting in camp.

One year, when the Wisconsin game law allowed it, we hunted with hounds, but though we were successful in the number of deer secured, yet none of us were satisfied with that method of hunting and rejoiced that the succeeding Legislature passed a law prohibiting it. We all agreed that it is far better to give the deer a chance for his life. If he can outwit you so much the worse for you, but if you can outgeneral him so much greater and satisfactory is your victory. Our experience has shown that hounding deer drives them away from the territory in which you are hunting almost as effectually as a band of wolves will. It makes the deer more timid and wild, and if you attempt to still-hunt them after they have been dogged, at the first cracking of a stick or the snapping of a twig they are off at top speed, and the most experienced cannot tell when they will stop running. Deer that are constantly dogged do their feeding at night and

when daylight comes they hide away as best they can. Hounding deer also tends to exterminate them, for the young deer run more like rabbits, and making short circles are easily and quickly killed off. In sections where I have known hounding to be vigorously followed up this is so true that at the end of a season after a fresh fall of snow it would be almost impossible to find the track of a small deer, and when they are killed off in this way, with every now and then an old one sandwiched in, how long will they last? Is there any glory or skill in sitting by the water all day to kill a deer taking refuge there, which any boy could almost kill with a club? Is there any true sportsmanlike satisfaction in it, to say nothing of the condition of your venison, after the heat of a long chase by the dogs at full speed? I like a hound as much as anyone and no one enjoys more than I do the sound of a dog giving full tongue in the woods, but I draw the line at using them on deer.

There is another, even more unsportsmanlike method, of hunting deer and that is by the use of the headlight, and no other one thing has done more to exterminate the deer in northern Wisconsin than this. Dogged by day and headlighted by night, what chance for life has the game? I have heard engineers on the "Soo" and "Northern" roads say that in the hunting sections through which their trains run they have frequently seen a hunter with a headlight on to nearly every half mile. Probably this is exaggerated some, but it suffices to show how bad it has been. These men have patrolled the railroad tracks from dark until morning waiting to catch a "shine" as the deer crossed the track or occasionally walked up or down the right of way. For this kind of butchery a variety of weapons are used. The ordinary rifle or shotgun, of course, predominates, but frequently among such hunters are found No. 8 Chesapeake duck guns, single barrel and weighing about nineteen pounds. These guns shoot nine bullets, not buckshot, with a corresponding charge of powder and kill at from fifteen to twenty rods. Then there are rifles with five or more barrels fixed to shoot singly or all together. A good, strong, cool-headed man with a powerful bullseye lantern strapped over his left eye and well armed, is pretty apt to kill three out of every five times he gets a "shine," which is the reflection from the deer's eye, and I have known men who made a business of it to frequently kill from three to nine deer in a single night. They travel quietly against the wind and are quick, so that what chance does a deer stand that comes upon one of them suddenly and within range? There is no sound, no scent, nothing but that big flaming orb at which the deer stares in wonder until from out it comes the crash of death. It is the method of the butcher and it is moreover a dangerous way to hunt. I have known of many instances when valuable oxen and horses belonging to lumbermen were killed by mistake in this way, and in my personal experience two men have been shot down by careless hunters who mistook the light from their lanterns to be the reflection from the eye of a deer, for when a deer is standing sideways to the man with the light only one eye shows. Why, one time a party of surveyors who were camped near us were at work in their tent by candle light, making out the "profile" for the day, when a bullet sped through their tent just over their heads. An investigation showed that a fool headlight hunter had caught the gleam of the candle and without stopping to turn his light off, thus seeing whether it was the reflection from an eye or the light from a camp, he let go. There is, of course, some sport about headlight hunting on land or on the water, but it is hard work, tiresome work, and worse for game and for the hunter than hounding.

There are still other methods used in capturing deer, such as snares, pitfalls and set guns, but these are so barbarous and so little used that any discussion in regard to them seems useless, and yet even now they are used to some extent and rarely a season passes by that the press does not record the death or wounding of some hunter in northern Wisconsin or Michigan by a set gun.

Our favorite methods of hunting, as I have indicated, were driving, still-hunting and watching. It has always been our plan while in the woods to get out early in the morning, experience having taught us that the best hunting is from daylight until about nine o'clock, as then the deer, if not dogged or hunted too hard, are generally moving around and the chances for a shot are greatly increased. After a drive or two we separate to hunt toward camp, figuring to reach there in time for dinner and then to work or loaf around until about half past three in the afternoon, for after that time the deer are apt to begin to stir around again. It is true that the deer are in the woods and not in camp, and if one wants to get them he must go where they are, so that a man when out in the woods, is apt to get a shot at any time, while the man in camp will certainly get none, but there is no use in working all the time or in staying out when the weather is bad, so that we have settled down to about the hours as given and generally with good results. Bright moonlight nights make still-hunting poor, for then the deer move and feed more freely during the nights and correspondingly less during the day, so that when the moon is full and bright we generally do more driving and watch late in the evening. For the latter salt licks and scaffolds have been an aid, but these adjuncts, too, have been abandoned as unworthy the true sportsman. To discover a good place to watch requires good powers of observation and knowledge, and the locality must be chosen with a view to the way the game is expected to come and which way the wind is blowing. It is also a good plan to get up on a fallen tree, a stump or rock, for a person so situated is not in so much danger of being seen or scented. Once located it behooves the watcher to keep perfectly still, for a deer is usually very quick to detect motion of any kind and their ears are keen to catch the first sound. In fact, no matter how he hunts, it behooves the man who would be successful to be constantly on the watch, to move carefully and when he gets a shot, be it standing or running, always to see hair through the sights before he pulls the trigger. CAROLUS.

## The Life of a Deer.

AWAY far back in the deep forests of northern Maine a young deer was born. He was a tiny little fellow, and his coat was spotted. His kind mother had selected a dense clump of young spruce for his early home. For a time he lay quietly on his bed of dry leaves, only standing up at such times as his mother came to him and roused him. But as he grew he began to frisk around, and began to want to go out, but his mother made him understand that he must obey, and taught him many things. She taught him that when danger came he must drop down flat in the bushes and leaves and lie perfectly still, not making the least sign, and he, being so small, the enemy would not see him and he would escape. Then she taught him that if she left him at any place he must never move from that spot so she could find him on her return. He obeyed her, and so lived and grew through the summer and was a fine large fawn. He wintered with his mother and many others in the deep spruce woods. Sometimes deep snow covered the ground and it was very cold, but he was strong, and the wild creatures know well where to look for food.

Then spring came and new wild blood flowed through his veins. He went out alone into the woods and finally left his mother alone to care for another young brother. He learned many things, one of which was to fear man. While feeding with others, he had heard a sharp crack, and a big buck that was feeding near him had sprung high in the air and fallen dead. He fled to the woods, but, lacking the caution of age, had turned and walked softly back and peered through the bushes to see why the big buck should fall and lie so still. He saw a man hurry out of the timber and cut the buck's throat, and while he stood trembling with fear, the man proceeded to skin and mangle the buck in a horrible way. Then he fled on, and on, not stopping till he was very tired, so to get as far away as possible from such a horrible, cruel creature as that man was. He never forgot. If he heard that sharp crack he always fled at once. Soon he began to have a soreness in his head and finally his horns broke through. Two "spikes" they were, but still horns, and were for battle and defense. He was proud of them, but they soon got him in trouble with older bucks who would have none of his lordly ways in their presence. But still he grew and waxed strong, and the next year he won some hard fought battles, and he had his mate with him till spring came again.

Now he was full grown and had a magnificent head of antlers. There was not a larger or finer buck in the forest. He had many battles and was always victorious. His fame spread abroad and hunters went far into the forest to slay him, but he was quick of sight and keen of scent, and, with all his bravery, had learned caution. When his keen eye or keener nose told him that men were near he fled and would go deeper back into the forest and stay for days and weeks. Then he would venture back cautiously and would not appear in sight till he knew that the man had gone. So he lived on, and was monarch of all that country. He had become such a terror to the other bucks that hardly one dared fight him. His pride was at last his ruin. On a bright fall day he came to the side of the lake with his herd to drink. All was still. Man had not been seen or smelled, and no danger was in the air. On a high bank a young buck stood in the warm sunshine. He did not move when the old giant came in sight. This made him mad, and he charged upon the bank and the young buck fled. Then he marched in lordly style to the top of the bank, raised his head and snorted forth his note of defiance to all the world. Crack went a rifle from the lake below and the noble animal leaped high forward, and a few more jumps, and down to earth he went with the hunter's rifle ball through his heart, and the famous buck of the great forest was no more. HUNTER.

## Bear Mention.

WHEN I started the town of Hallock, in the northwest corner of Minnesota, in 1879, bears were quite plenty in the timber belt which lines the Two-River Creek on which the settlement is located. In winter they dened in the banks on the creek and in summer played pranks in the school house yard. There was no settler nearer than at a point eighteen miles up the creek, toward the Roseau region, where one Carney had a cattle ranch of some eighty head. These animals grazed on the open prairie and housed in the timber belt. Ephraim Carney, a youngster of fourteen years, was his father's chief herder, and one day when we were walking through the oak woods I noticed that a good many of the smaller branches were broken where bears had garnered the acorns; it being their habit to climb out on the limbs as far as they would hold, and then to scoop in an armful of twigs and nip off the nuts. I asked Ephraim if he saw many bears in the course of the year while herding the cattle. "Oh, yes," he said, "quite a few!" "What do you do when you see a bear?" "Don't do nawthin!" in a tone of contemptuous surprise. "Well, what does the bear do?" "What does he do? Well, if he's on the ground he stands up, and if he's up a tree he just goes up higher." I thought this was a cute description of bear traits. Then I asked Ephraim if the bears didn't sometimes bother the cattle, and he said "no."

This statement seems to settle the question for the northwest. The bears should never lack for food nor be hungry for meat, except when they come off their hibernation in the spring. I spent parts of seventeen years in the vicinity of Hallock and never heard of bears troubling pigs or calves.

With the middle south the case wears quite a different aspect. Only last week I was talking with Supt. Mann. of the North Carolina State Experiment Farm at Tillery, about the depredations of bears in Hyde County. It seems that they became so destructive to the North Carolina Cattle Co. that experts were employed to thin them out with trap, gun, poison, deadfall, side hunts and drives. Forty-six were killed by old Bob Gerry, a colored man, in one winter. I think it was in 1876. A particular class of large bears known as "sinnakero" made the havoc. Hog bears are smaller and different. But both kinds go for meat in any hard winter, after berries and mast are "done gone," and the cow peas and corn and sweet potatoes and apples are stacked or housed. At

such times the range cattle are afraid to go into the pocosons, and keep to the savannahs and "reed lights," reeds or canes constituting their principal feed. The bears climb the junipers, gums, and cypresses where the cattle trails pass, and lying along their extended lower limbs drop like felines on the luckless animals passing underneath, suck the blood from their necks while clinging to them as they run. In the end the victim succumbs from fright, exhaustion, and loss of blood, and dies miserably. CHARLES HALLOCK.

## Which of them Favor Cold Storage and which of them are Opposed to the Protection of Game?

*Editor Forest and Stream:*

A bill was lately introduced in the Assembly by Hon. E. P. Prentice, of the city of New York, representing the Twenty-fifth Assembly District, to amend section 141 of the game law. This section 141 was introduced for the benefit of the cold storage men and provides by giving a bond for \$1,000 a dealer in fish and game may keep fish and game during the close season; in other words, a dealer in fish and game, by giving a bond for \$1,000, may break a law the remaining inhabitants of the State may not break. The manner in which this section 141 was placed on the statute book was, in the opinion of the writer, disgraceful, and the subject has been referred to in a letter in your issue of 26th March, 1904.

The Prentice bill seeks to amend section 141 by striking game from the provision of the section, and thus proscribing the possession of game during the close season. Should this bill be passed, it will be unlawful to have game in possession during the close season, and to accomplish this end is the sole object of the bill.

Now, it goes without saying, if one be opposed to the possession of game in the close season, he must favor the passage of the bill, while if he favor cold storage during the close season he will oppose the bill.

The Assembly Committee on Fish and Game is composed of thirteen members. As Mr. Prentice's bill has not been reported, it is obvious that a majority of the committee are opposed to game protection, favor the keeping of game in the close season and favor the cold storage of game in such season.

The names and addresses of that committee are as follows:

Hon. Willis A. Reeve, Patchogue, L. I., N. Y.  
Hon. Edwin A. Merritt, Jr., Potsdam, N. Y.  
Hon. Chas. S. Bridgeman, Kendall, N. Y.  
Hon. H. Wallace Knapp, Mooers, N. Y.  
Hon. John F. Simpson, Hurleyville, N. Y.  
Hon. A. P. Smith, Savannah, N. Y.  
Hon. C. R. Matthews, Bombay, N. Y.  
Hon. Frank L. Stevens, Hoosick Falls, N. Y.  
Hon. Jay H. Pratt, Verona, N. Y.  
Hon. F. C. Wood, Gloversville, N. Y.  
Hon. John Wolf, 251 Powers street, Brooklyn, N. Y.  
Hon. Edw. Rosenstein, 141 Clinton street, N. Y. City.  
Hon. Robert W. Chanler, Fishkill-on-Hudson, N. Y.

Doubtless some of the above are in favor of reporting the bill, and it is but right that they should declare themselves. As for the others, they can safely be left to their constituents.

NEW YORK, April 5.

## Northern Big Game Grounds.

MONTREAL, April 4.—*Editor Forest and Stream:* I had occasion to look for good fishing grounds in the Rocky Mountains and wrote to a disinterested party at Golden, B. C., and the Canadian Pacific Railway, asking him about the pack-horse trains to certain good grounds, and also asked him to advise a friend of mine. He writes as follows:

"I have written to Mr. ———, sending him two large maps covering a choice of three separate trips where the party would doubtless obtain game. These American hunting parties are chiefly keen on the black-faced caribou and it means dollars and cents to the railway company to put them directly in the way of getting at this game without a long, tiresome, pack-train journey to reach the best grounds. If these hunting parties fail to get game they will soon fire up the country in disgust. No local prejudice should stand in the way. The valley of the Beaver-foot and across the east slope of the Rockies has been shot out and bands of Indian hunters clean up the game almost every season.

"Parties coming should be put into a practically new and unexplored section (though we know game is abundant there), and then if they have a successful hunt they will come again and bring others. Long pack-train journeys should be avoided and the party put on the shooting ground with as little delay and unnecessary work as possible, and this cannot be done by coming in from Banff and Simpson Pass. The very best shooting ground at present is under the east slope of the Selkirk in the valley of Dutch and Findlay creeks, and in the vicinity of Prairie Mountain in the valley of Beaver. I send you a small map showing the location of the latter. The first mentioned is south and west of Sinclair Pass and is not shown on this map. In writing Mr. ——— I traced out for him three different routes the party could make, in which I think they will find ample game, and of a variety."

Golden Station is between the Rocky and Selkirk ranges, on the Canadian Pacific Railway where the two ranges are only about a mile apart. A line of small steamers runs from Golden to a point quite close to these hunting grounds. This information may be of value to others. L. O. ARMSTRONG.

## For a Man Who Really Wants a Grizzly.

MONTREAL, April 7.—There are occasionally bits of information that will be of value to your readers, and which I can personally vouch for. I have a letter from a sportsman who resides at Golden, B. C. He says: "You can guarantee bears to at least five or six parties within a few miles of Golden if they can get here before the 15th of May. We have guides and outfits here for that number. A man who really wants a good grizzly skin should come now." L. O. ARMSTRONG.

## Fish and Fishing.

### Maskinongé or Mascalonge.

BECAUSE of his high standing in the ranks of writers upon angling subjects, Dr. Henshall's offer, in *FOREST AND STREAM* of March 26, to join hands in the endeavor to secure uniformity of common names for our game fishes, is extremely gratifying. Given a proper understanding of the object to be attained, among a goodly number of those of light and leading in the community who are determinedly united in their efforts, I believe that the difficulties in their way are far less insuperable than the doctor fears. In order to arrive at such an understanding, however, it is necessary to deal rather with facts than with opinions, and in the case of the latter to agree to press or to accept them as the case may be, merely for what they are and for what they are worth. Unfortunately, I find a great gulf fixed, at the very outset, between Dr. Henshall and myself, as to the value of opinions. As defined by Webster, I believe opinion to be a belief stronger than impression, though less strong than positive knowledge. I regard it as a reasonable supposition. Dr. Henshall, on the other hand, says: "My opinion, as quoted by Mr. Chambers, is not 'a supposition,' but is, I think, a fact." On my side I can neither conscientiously claim that my own opinions are facts, nor yet concede as much for the mere opinions of others.

It may be taken for granted that uniformity in the vernacular names of fishes is easier of attainment when the name proposed is that most in vogue, but it is not essential to success, as Dr. Henshall seems to think it to be, that such a name should always be adopted; and instead of being satisfied with feeling that it is very fortunate when the selected name is both proper and distinctive, I believe that we should never attempt to secure uniformity for any that does not comply with both of these conditions, no matter whether it be that most in vogue or otherwise.

A striking illustration of the success which may attend united effort in this direction is afforded in the case of the name of ouananiche. Though various forms of orthography commencing with a "w," such as winninish, winonish, winanish and wananish almost invariably appeared in the American literature of the fish up to nine or ten years ago, the name is now seldom seen in print anywhere except as ouananiche. The change dates from the time that the priority and appropriateness of the last mentioned spelling of the word—as ascertained by thorough investigation in the place of its origin—were presented, together with the evidence supporting the claim, to the discriminating constituency served by *FOREST AND STREAM*, and to such influential publicists as Dr. John Duncan Quackenbos of Columbia University, President David Starr Jordan of Leland Stanford, Jr., University and the late M. A. N. Cheney.

In the case of the fish to which Dr. Henshall refers in his recent communication, it would doubtless be quite possible to attain the same result, even were the more appropriate name—maskinongé—for which I have urged uniformity, not that which is the most in vogue among those who angle for it, though I really believe that it is so. Dr. Henshall thinks otherwise, and therefore I claim that the matter narrows itself down to a question of fact, rather than a mere matter of opinion.

The doctor has given us the names of half a dozen angling authors who use, or favor, he says, the name mascalonge, though everybody acquainted with their writings knows that some at least of the number have employed other forms of the name. It is perfectly easy, too, to produce a greater number of authorities for the use of either maskinongé or muskellunge than he has given us for his favorite form of the fish's name.

Mr. Cheney, one of the doctor's six authorities for mascalonge, uses also muskallonge at page 336 of the first volume, new series, of the reports of the New York State Fish, Forest and Game Commission.

Another, Mr. Charles Hallock, gives both maskinongé and muskellunge, as well as mascalonge.

A third, Dr. Tarleton H. Bean, testifies to the priority of maskinongé.

Mr. Fred Mather, as quoted by Dr. Henshall himself, "has investigated the origin and etymology of the word to a greater extent than anyone else, and he favors the Chippewa derivation of the name maskinongé as opposed to the French derivation of *Masque allonge* and its variations.

Three, then, of Dr. Henshall's six authorities, admit the propriety of the orthography maskinongé; Mr. Fred Mather, as shown by the doctor himself, Mr. Hallock by employing this form, alone, of the name, in his *Fishing Tourist* (page 197), and Dr. Tarleton H. Bean, who, like Mr. Mather and so many others, admits the Indian source of its derivation. Like Mitchell, Kirtland, and Jordan and Evermann, Dr. Bean adheres to the scientific nomenclature, *Lucius masquinongy*, in his newly issued paper on "The Food and Game Fishes of New York" (1903), while Dr. Henshall does not. The latter tells us that in one of his recent books he has retained the specific name, *nobilior*; as, in his opinion, "the later name, *masquinongy*, is irrelevant and was bestowed on

insufficient evidence." The facts of the case do not bear out this opinion, however, for *masquinongy* is neither a later name than *nobilior*, nor yet was it bestowed on insufficient evidence. *Nobilior*, according to Dr. Henshall, was conferred by Rev. Zadoch Thompson in 1849. The doctor apparently shares the doubts expressed by others, that Mitchell had conferred *masquinongy* in 1824, though DeKay, the author of "The Fishes of New York," is authority for the statement that he did. In any case, however, it is fortunately unnecessary to go back to Mitchell in order to show priority of *masquinongy* over *nobilior*, for Kirtland employed the former name at page 194 of his "Fishes of Ohio" in 1838, eleven years before the *nobilior* of the Rev. Zadoch Thompson made its appearance. In the "Encyclopædia of Sport" (London and New York, 1896) Dr. Bean points out that "the priority of the Indian word, *maskinongé* is well supported."

Jordan and Evermann's new and magnificent catalogue of "The Fishes of North America," in four sumptuous volumes, certainly constitutes the court of final appeal in matters concerning the scientific nomenclature of North American fishes, and when backed up by such other authorities as Dr. Tarleton Bean, already quoted, and by Dr. Hugh M. Smith in the *Manual of Fish Culture*, issued by the U. S. Fish Commission, in adhering to the name, *Lucius masquinongy*, it is safe to assert that *masquinongy* it is and *masquinongy* it will be for generations to come. Mr. George McAleer, in Dr. Johnson's elaborate new work on North American fishes and fishing waters, follows the now almost universal manner of writing the scientific name of the fish, giving both maskinongé and mascalonge as the vernacular. It certainly seems absurd, however, when so excellent an opportunity is afforded of using the scientific name of a fish as the vernacular, to insist upon a variation. If *masquinongy* is to remain the scientific title, as it seems pretty certain that it will, why should not the popularization of the vernacular, *maskinongé*, be encouraged, rather than the hybrid orthography, *mascalonge*? This is how the matter presented itself to the distinguished American and Canadian sportsmen, fish and game commissioners and others composing the North American Fish and Game Protective Association, when they unanimously adopted the resolution so adversely criticised by Dr. Henshall.

Perhaps one of the greatest authorities of the age upon the proper classification and nomenclature of fishes is Dr. Gunther, a fellow of the Royal Society and for many years keeper of the zoological department of the British Museum. In his voluminous "Introduction to the Study of Fishes" he avoids the word *mascalonge* altogether and describes the fish as "muskellunge or maskinongé."

Jordan and Evermann equally avoid *mascalonge* in their latest work on "American Food and Game Fishes" (Doubleday, Page & Co., 1902,) adhering to the scientific form *masquinongy*, but so far contradicting Dr. Henshall's statement that "common consent and custom have decreed among the majority of anglers that it is mascalonge," as to declare that *muskallunge* is the spelling which now seems to be most usually followed. And from the long list of variant spellings which is given, the form *mascalonge*, as already intimated, is carefully excluded, though both *masquinongy* and *maskinongy* are given.

That most magnificent specimen of the American sportsman and angling author, Mr. Genio C. Scott, admirably summed up, many years ago, some of the reasons which compelled his use and advocacy of the orthography, *maskinongé*. In his "Fishing in American Waters," he says: "The Ojibwa name of this fish is *maskanonja*, meaning long snout. When Canada was a French colony the *habitants* named it *masque-longue*, signifying long visage. I submit that the Ojibwa was entitled by priority to the right of naming the fish; but, as the Dominion of Canada has named it again, and in all legal enactments there in reference to it the name of the fish is written *maskinongé*, I willingly accept the modification instead of either the Irish or the French name. Thus much in explanation of naming a fish which has puzzled most ichthyologists and anglers, so that they have been uncertain and dubious on the point. The name is maskinongé." And to emphasize his concluding statement, Mr. Scott printed the name in small capitals.

It is unnecessary to weary the reader with other quotations from American or English authors who both use and favor the name maskinongé.

Among Canadian authorities, Prof. Prince, of Ottawa, takes deservedly high rank. In a very scholarly paper on "Vernacular Names of Fishes," published by the Dominion Minister of Marine and Fisheries in 1901, Prof. Prince, of Ottawa, says: "As a rule these early names"—Indian or Indo-French names, which the early settlers continued to apply to animals, because they were already in use—"always more or less accurately describe features in the forms on which they were bestowed. Thus the name maskinongé, commonly, but very erroneously, spelt muskellunge or mascalonge in the United States, is really an Indian name, the Chippewa name for pike being *kenosha* and the prefix *mis* or *mas* means large or great, so that *maskenosh* or *maskinogé* (corrupted into *maskinongé*) is really a large, deformed pike."

I might continue to quote from other distinguished writers of fish and fishing, notably from Mr. Whitcher, from Mr. Wilmot, from Mr. L. Z. Joncas, from Prof.

Ramsay Wright, of the University of Toronto; from A. N. Montpetit, author of the exhaustive book entitled "Les Poissons d'eau douce du Canada; from Castell Hopkins, in his "Cyclopedia of Canada; from Sir James M. LeMoine, D. C. L., F. R. S. C., in "Les Pêcheries du Canada," and from many more, did time and space permit; though I am satisfied that enough has been said to show that the employment of the form mascalonge is far from being as general as Dr. Henshall supposes, and that if uniformity of nomenclature is to be striven for in the case of the fish in question, with any prospect of success, it must be upon the basis of the name by which it has been officially known for considerably over half a century in the country in which it was first found and described by white men—which has received the general indorsement of writers upon fish and fishing—and which by Mr. Genio C. Scott, in 1849, and by the North American Fish and Game Protective Association in 1904, has been alike declared to be *maskinongé*.

E. T. D. CHAMBERS.

## A-Fishing Would You Go?

From the Log of Camp Nessmuk.

HE would know of the ways and joys of a "Nessmuker," or life under the greenwood trees, of the strikes and trophies of rod and reel; of the beauties of mountains, the melody of murmuring brooks and the play and splash of mimic Niagaras; of the epicurean delights of a bountiful camp larder; of the mysteries of the sparks ascending through the leafy branches far into the darkling night; of the joys unconfined that linger and loiter in and around a canvas home, under grand old maples, surrounded by balmsy hemlock covered mountains, deep down in the "kettle" with the waters of some "Big Sock," "Dry Run," "Kettle Creek," or "Ogdonia," clear and cold, mingling and murmuring at your feet—each the haunt of the shy but gamey trout—the hawk of the brook—waiting the call of your reel and the dropping of your flies, to be yours, perhaps, after an unequal though gamey fight; or of the dewey freshness of sleep upon a hard but wholesome bed, stripped from the feathery hemlock, all bound and cemented by the ties of congenial companionship among true friends, each anxious to serve your comfort and pleasure; of these and the thousand and one things that go to make life pleasant under the greenwood trees, and knowing, would enjoy? Come with us. Sit round our Nessmuk fire and watch the glimmering sparks as they go to join the twinkling points of light far up in the calm, enfolding vault of heaven. Behold the crescent moon as she breaks over the brow of yonder mountain, casting shimmering lines of molten silver over the dimpling waters of the 'Sock and plays hide-and-seek amid the leafy blackness of our maple trees. Go forth in the early morn with rod and creel up the rocky bed of Dry Run to try, in its mid-day gloom, the cast for beauties speckled o'er with red and black and silver; at the sinking of the sun behind that high and wooded peak, take your place at the rude table, prepared with appetite known only to the fisherman after a hard day's tramp, to partake of the evening meal—trout, done to a turn, coffee, Mocha and Java—the blended essence of the desert and the Isles of the Orient, fit drink for Olympus. And the work of camp—help to build the fire of drift and logs, in the manner pointed out by our patron saint, Nessmuk, but no saint was he if his runi rhymes read true, though deep learned in woodcraft and camp lore; join the friendly group circled round the brightening fire where tales and song and laughter bid Time fly on golden wings unnoted. After the making of the bed, take your allotted place in the row of recumbent forms beneath the fleecy blankets, where each face is lit by the fitful light from the blazing, crackling fire as it burns and hisses in front of the open canvas door, and one by one, to the music of the katydids, the call of the whippoorwill, the sighing of the winds, the murmur of the leaves and the rhythmic plashings of the waters, fall to sleep—the sleep that the call for breakfast—5 A. M.—will leave you fresh and vigorous for another day; another day in camp; another day in the balmy mountains; another day to seek the trout in his favorite haunts; another day in which to drink the life-giving ozone and the joys of life in the greenwood.

The simple annals of camp life, with its work and its play, its sun and its shadow, its going and its coming, its days and its nights, its incidents and its charms, we might attempt to portray. Not as they are, for who can paint the beauties of nature, the charm of moonlight upon mountain and stream, of the glory of the orb of day sinking beyond peak, while its last lingering rays illumine the tops of yonder mountain range; or who could reproduce the music of the waters and the winds; and what of the night, with its soundless stillness broken ever and anon by the soulful cry of the whippoorwill and the mournful hoot of the night-haunting owl? Of the thrill of a strike when the hungry trout leaps for the seductive fly, and the ex-

pectant fisherman, hand steady and nerves tense, feels that the cruel hook has gone home, and that his skill is now to be put to the test, of all these I can tell you naught. To know them as they are you must see and feel their subtle charm.

Life is pleasant under leafy boughs; but at times the sun hides his face, the rains descend, the lightning flies from peak to peak, things get wet, gnats and mosquitoes make living a sore trial, teamsters forget their promises and railroads are distant, and walking footsore and wearing, but we go afishing and complain not.

WM. WALTERS CHAMPION.

WILLIAMSPORT, Pa.

## Salmon Fishing.

There is a keen delight in catching a salmon, especially the first one, and the experience never palls. Each fish has an individuality of its own; and no two act alike. Some are bright, sprightly fellows, who take out line freely, let you see them often, keep going from start to finish, and fulfil every requirement of a well-bred fish; while others are sulky brutes, who may rush away when they first feel the hook, but soon plunge into deep water, and there chug away at the bottom until one's patience is nearly exhausted. Some days they are greedy and take anything that is thrown where they can see it; again they lie almost motionless, perhaps a dozen or two together, not rising even to look at the fly, or if they do take any notice, come up lazily, apparently size up the feathered monstrosity and reach the conclusion that it is not in their line. This is sheer perversity on their part, and most annoying. As the guides say, they could make a fly, they have seen so many.

Just above tidewater on the St. John (Gaspé) there is a pool much frequented by salmon—the Whirlpool—not often fished, but seldom failing when cast over. The water is not deep, and huge fish are always in sight. One day we were going up the river after trout, though not averse to a salmon if it came our way. A little chap, eight or ten years old, was in the party, equipped with a cast-off trout rod, a rickety reel, with only a few yards of line, and a frayed fairy fly at the end of it. When we reached the Whirlpool the salmon were there, as usual, and in such a position that we could put the fly right over them with every cast. They were evidently in a very finicky mood, for though we almost exhausted the fly book for them, trying Jock-Scott, Durham-ranger, silver-doctor, and several others, they calmly ignored our best endeavor. The little fellow, meanwhile, was whipping the water a few feet from shore with his old fairy, when a salmon darted in, seized the fly, made a quick rush away and took all the line, leaving the youngster gaping with astonishment. That was the only salmon that rose that day for anybody.

A year or two afterward I was again on the St. John, with no license for salmon, but free to catch trout in tidewater under no compliment to anybody. My brother, who had not been in these regions before, had never seen a salmon alive, but was very anxious to do so. We had not come across a salmon in tidewater, and on the last afternoon of our stay were chatting with the guardian, and asked if we could not go up to the Whirlpool on the quiet and have a try for a fish, but this grizzled old salt, who after years of voyaging had settled down in his declining days into the dignified and not strenuous occupation of a river policeman, would not hear of it. At last, however, he consented to allow us to go up in the canoe if we left our rods behind; we could see the fish, but to catch them was out of the question. Our canoe-man was an old hand at the business, and as we poled up the river was not too complimentary to the guardian, who, he thought, need not have been so very particular. We were soon at the coveted spot, where, sure enough, twenty or thirty salmon were swimming about. We watched them with ill-concealed longing for an hour or so, when our guide said he guessed he would find a way to circumvent the old whaler.

We had no rods, but flies were available, and the guide had a cod line in his pocket, ten or fifteen fathoms of it. From the thicket near by, he cut a sapin pole, ten or twelve feet long, leaving a crotch at the top. Then tying a large fly to the cod line he whirled it deftly in the air, dropping it nearly over a salmon and letting the line rest in the crotch of the sapling. It was then easy to work the fly on the water. After several casts a salmon actually took the fly, hooked himself securely, and after a few minutes of never-to-be-forgotten battle, was dragged to shore by main strength, killed with a club, and hid under brush in an ice cold spring, whence we extricated him on our homeward journey next morning. This was not exactly sportsmanlike, but we wanted the fish, and everybody is a bit of a poacher, once in a while.

It is the dream of almost every fisherman to catch a salmon, but most of them are under the impression that it is a tremendously expensive operation. So it is under ordinary conditions, but it is possible to have good sport on water that is free or nearly so. All streams are free as far as the tide reaches, subject only to the permission of the owner of the adjoining lands, if one fishes from the shore. In most of the Canadian waters there is free or unleased water for some distance above the tide. This is the case on the Restigouche, one of the very best salmon rivers in the world. Most of the Restigouche, with its tributaries, the Matapédia, Causapscal, Upsalquitch, and other smaller streams, are controlled by the Restigouche Salmon Club, an association composed of millionaires mostly, who come in palace cars, and live in luxury at the club house at Matapédia. Five dollars a pound would be a low average for the fish caught by these gentlemen. Fun can be had for less money.

The club limits run out a few acres below the Matapédia bridge of the I. C. R. Between that and tidewater is a stretch of six or seven miles, some of which is leased to private parties, but a good many excellent pools may be fished for a dollar a day, or without any fees whatever. Every salmon that goes to any of the rivers above-named passes through these waters, and if one is prepared to stay a week or two at the right time, late in May, and up to the middle of July, according to the season, he may be reasonably sure of several salmon. Most fishermen stay in Campbellton, N. B., going up the river on an early accommodation train, both good and cheap board can be had in the vicinity of flat lands.

The fishing is from canoes, and the two guides that are necessary get from \$3 to \$4 a day, including the craft, which is of birch bark of the Gaspé variety, as the paddlers are red or white in color.

One morning on the train from Campbellton I got into conversation with two gentlemen—one from Ottawa, the other from St. John, N. B.—neither of whom had ever cast a fly over salmon. The Ottawa man was well equipped, but the Blue Nose had an old trout rod, that had been kicking around Murphy's Hotel at Dalhousie for years, a common reel, with cogs so worn that the line would not serve, and a line to match, so rotten that one could break it easily in the fingers. It is usually considered that with a good rod and reel a test of eight pounds for the leader and line is sufficient, but the line in question would not stand half that strain. I told the St. John man that he was wasting his time in going after salmon with that outfit, but the sequel proved I knew nothing about it, and that luck is often with the tender-foot.

I went out that morning with a farmer, Delaney by name, who was an excellent canoe-man, but when noon came we had not even a rise to comfort us after many hours of casting. Sitting on Delaney's porch after dinner, on a hill overlooking a wide stretch of water, we watched our friends of the morning fishing on the opposite side of the Restigouche. After a while one of them was seen to raise a fish. The anchor being lifted, a struggle began which took the canoe over several miles of water. Nearly two hours the fight lasted, the climax being reached when we saw the fish gaffed on a shallow bar only a few yards from our shore.

We ran down to see the result, and found that our St. John man, with his rotten outfit, had actually landed a forty-pound salmon, and you have to see a fish of that weight to realize what a huge monster he is. The fish was almost dead when he was gaffed, and had hardly strength enough left to kick when he was flung on the shore. The amateur was fortunate in having as his guides Indians of great experience, who realized exactly what had to be done, coached the man with the rod every minute and actually played the fish with the canoe. It was the largest of the season. But don't take this as a precedent. It is always safer to have good tackle.

C. W. YOUNG.

COMAU, Ont., March, 1904.

## Adirondack Trout.

The ice in the northern lakes still remains intact and three feet or more in thickness. Even with continuous warm weather from now on, it will probably not go out until nearly the first of May. Throughout most of the wilderness region the ground is covered with four feet of snow and this is not likely to disappear until about the second week in May or later. Anglers usually expect to have the best trout fishing in the Adirondack lakes immediately after the ice leaves them, but in the rivers and smaller streams the finest sport comes later, when the speckled beauties are active on the rifts.

Trout may be taken on and after next Saturday, April 16, but fishermen who frequent the Adirondacks or Central New York—where there is still considerable snow left and the streams are all greatly swollen—will not have much angling for some time to come. The conditions this spring are very different from what they were a year ago. Last spring the snow and ice in this part of the State had nearly all disappeared by the middle of April, and the trout were ready to bite as soon as the law permitted the angler to go out, and good trout fishing was had in the Adirondack lakes about as early as in the waters of Central New York. But the spring of 1903 was a remarkable one in many ways and its like may not be experienced again for many years.

Veteran anglers predict that the coming season will be excellent for lake fishing, basing their forecast on the old time belief that trout are not able to obtain as much food during a long and severe winter as during an open one, and consequently when spring opens they are ready to jump at almost any lure which is offered them. If there is any foundation for this theory the trout ought to have pretty good appetites by this time, for the winter of 1903-04 was one of almost unprecedented severity.

As a rule, the fishing in the streams of the Adirondack region appears to be deteriorating, and without more effective measures to protect the trout, or to restock the waters, it will not be many years before the angler will have to look elsewhere for his sport. The main trouble comes from the wholesale slaughter of infant trout in the small brooks by amateur anglers who are more ambitious to tell a big story about the large number of fish they have captured within a few hours than to respect the law, or by men fishing to supply the tables of hotels and boarding houses, and whose employers are not scrupulous about having the fish measure at least six inches in length. It is unfortunate that the law in regard to the size of trout that can be taken is not more closely observed, but it is not easy to enforce it, with the present number of State game protectors. Many people believe that if special game protectors were given the same right of search, without a warrant, which the State protectors have, a far better observance of the law might be secured.

Sportsmen familiar with the Adirondacks are firmly of the opinion that the most effective way to improve the trout fishing would be to prohibit all angling in the small streams, for a term of years at least. This would give the little trout a chance to grow, and as soon as they attained to six or eight inches in length they would run down to the lakes or large streams to which such brooks are tributary, and thus restock them by the natural process. It is believed that such a move would be productive of far more satisfactory results than could be obtained by artificial stocking, even though all the fish hatcheries in the State were devoted exclusively to rearing trout to replenish Adirondack waters.

A lamentable circumstance in connection with the Adirondack trout waters is that many of the larger lakes and streams are becoming filled with black bass. Of course, these are game fish and many anglers enjoy catching them, but as speckled trout can not long exist in the same waters, their introduction in the Adirondacks will be deplored by hundreds of anglers who prefer trout fishing to any other because of the gentle art. The reason

for the disappearance of trout from waters inhabited by bass lies in the fact that the latter not only devour the eggs of the trout, but they prey on the young. There is no way of ridding a lake or stream of bass when they once become thoroughly established, and consequently it is safe to say that trout fishing is already ruined in scores of Adirondack waters which were formerly alive with the speckled beauties.

UTICA, N. Y., April 9.

## An Amateur Fisherman.

JOHN PIPER had been selling goods in northern New York for twenty years or more, and during all that time the "old man Brown" had never taken a day off for a vacation of any kind.

One day he said to him, for about the twentieth time, "Brown, I want you to go fishing with me."

"Vell, I know noting about dot feeching und I have no time to spare away from my beesness," replied the old man promptly.

"Yes, I know all about business. Have been hammering away at it ever since I was born. But we'll be dead one of these days and the chances are it will be too hot to fish after that. Besides, Brown, I don't believe that you were ever out in a row boat; there's some fun in that."

"Row boat, vell, mebbe not, but I was out by dot sea und dot was row boat enough for me, und don't you forget it."

"Now, Brown, we have talked this matter over a good many times, and this is the time I am going to have my way about it. I've got a steamer trunk here and it's well filled with every kind of fishing tackle you ever heard of, reels and rods and—"

"Vell, vell, dot's all right, but you see I can't go und leave der beesness, dere's dot bread und der cakes und der biscuit to go out und I can't go this time. 'Twould never do to leave der boys to do all this work midout me. They couldn't start dose wagons in time midout me."

"Well, suppose the wagons didn't start on schedule time. You are about seventy years old, and you've got money enough to tide you over if you never send out another wagon in your life."

The old man's eyes twinkled as he nodded his head complacently. "Vell, I guess dot's so, Meester Piper, und I vill take some beer und some schnapps und ve vill have vot you fellows call vun lark."

"All right, Brown, shake, but suppose you don't take the beer and schnapps, there's plenty of everything at the Harbor."

The following day found them both at Sackett's Harbor. More than a dozen men shook hands with Brown and said they were glad to see him out.

"Quveer how the folks all know me, I don't know nobody," he said, reflectively.

After they boarded the boat and while they were getting the tackle in shape, Mr. Piper said: "Now, Mr. Brown, when you get a fish on your hook keep your line taut. Don't give the fish any slack or he'll get away from you."

Everybody was very quiet for a few minutes when Brown had a strike and a beautiful black bass jumped out of the water forty feet away. Very much excited Brown started to reel the fish in when the handle of the reel slipped from his fingers and the fish pulled out twenty feet more of the line.

"Vell, vell, vell, dot beats me. We don't have no feech dot shump dot way in Germany. Dot black bass he must be a Yankee feechee."

By this time he had the reel under control, when the bass made another leap out of the water.

"Vell, I think if you got dot boat close to dot feechee he vill shump into der boat."

Alas for human hope. Another leap of the fish tore it from the hook and the line was reeled in with nothing at the end but an empty hook and sinker.

"Vell, vell, vell, vell, how do you suppose dot feechee got away? I keep him cooming right along pretty quivick, und now he's gone. Vell, vell, when you think I got anoder von like dot? Vell, you have vun on your line, too. Huh! und dere he cooms out of der water. See how dot pole bends. I think dot feechee'll break dot pole. Huh! und dere he shumps again, und now he's by the boat."

Sure enough, the oarsman had the landing net under the fish, which soon laid in the fish box, his struggles about over.

"Vell, I think I like this feechee pretty good ven you've caught 'em, but dose meech don't seem to bite me. I don't see vy I don't get some feechee myself." At that instant a fish took his hook, and the fun began again.

"Vell, I bet dot fellow don't got away this time," and he began to turn the handle of the reel as fast as possible.

"Hold on, there, Brown, don't reel so fast—give him a little more time or you will lose him."

"Vell, how is dot? You say, reel him in. Don't give him some slack. Keep your line taut, but don't reel so fast. Dot's a good deal for a man to think of at one time with a feechee shumping at der oder end of der line. Good gracious! he's a big one. See him shump."

As he spoke a four-pound bass leaped from the water, showing his entire size. Fortune this time favored the amateur, and the fish was landed without further trouble.

"Vell, vell, vell, I think dot feechee is more again as big as yours," and Brown looked complacently at his catch, but while he is gazing another adventure was going on which had not yet caught the German's eye. Happening to look up he saw that Mr. Piper had another fish in tow.

"Vell, I don't think dot's fair. You got dot feechee on your hook und say noting to me. How you expect I'm going to see the fun und learn der beesness if you keep all dese things to yourself?"

In the meantime the oarsman had thrown Brown's line in the water, and in the midst of his exostulations another fish seized his hook and away he flew

at a tremendous speed through the water. Brown had not had time to get the rod in his hand, and away went the reel spinning at a furious rate.

"Good gracious! dot beats me; I vunder if that's a feech or if dot vas a horse." And down came his hand on the reel so suddenly that it brought the fish up with a sharp turn, and it was a beauty. Brown in his excitement grasped the reel so hard that it had become unseated from the rod, and here he was with a monster fish and no appliances for handling him.

"Vell, vell, vell, I think dese feeching tackles is no good," as with the reel grasped in both hands he was holding it out at arm's length with the line still running. Mr. Piper was so fully occupied with his own line that he could not give his companion the assistance the situation demanded, but finally, having landed his fish, he gave his attention to Brown, and Brown was a picture beyond description. Leaning over the side of the boat, with arms extended as far as he could reach, holding on to the reel for dear life with both hands and a hundred feet of line out, the situation was to the novice desperate to the last degree.

Mr. Piper finally succeeded in getting Brown straightened in his seat, which was fortunate, as the equilibrium of the boat was very much endangered by his position. After replacing the reel on the rod he passed it again into Brown's hand.

"Vell, dot's all right. Now, how you wind him, fast or slow? and he began to slowly reel the line in. The fish had had his play spell and came along a distance of fifty feet with such rapidity that Brown had trouble in reeling his line as fast as the fish came in his direction. The fish, however, after covering this distance changed his course, and trouble began again immediately. Mr. Brown, having full confidence in his apparatus, lost his grip on both rod and reel when the fish made the turn, and had it not been for a quick movement of the oarsman both rod and reel would have gone to the bottom.

"By gracious! dot feeche vas quivick, und I think dot man Dave vas about as lifely," and he took the reel from Dave's hands. "Und dot's vat you call experience, und I have got dot, but I don't got der feeche. Vell, here ve go again." And he began to turn the reel, a dozen turns or more, with nothing but slack line to show that the fish was lost.

"How's dot? I don't feel him some more," and he continued to wind with a pained expression on his face which exhibited no concern over bread, or cakes, or biscuit. He finally came to the end of the line, and as he looked at the bare hook he turned despondently to his companion and said: "You think dot feeche bites again, huh? I think dot feeche must be pretty sore, and I don't feel I was much success for a fisherman yet."

"Well, never mind, Brown, that's part of a fisherman's luck, and all there is to do is to try again."

"Oh, yes, dot's all right. Dot's good advices, but it don't caught the fish dot vas lost." After a few minutes of silence he continued: "Vell, how long you stay here? I thought I would go back to-night, but if you think you vill stay I vill stay, too, and ve'll try them anoder day."

"Brown, I believe you are getting sporty."

"I think dot's sc, but you know I must make up for lost time. Meester Piper, van you coom this way again you buy for me some of dose feeching tackles und I vill try und make up some more of dose lost times. Vell, vell, vell, how you suppose I forgot my beer, I got no beer since last night."

FLORENCE L. WRIGHT.

## The Rhapsody of an Enthusiastic Angler.

WE are waiting for the first of May. It will soon be here. That calendar fact is inevitable, however little it means to the majority of people. But there is a comparatively small but fast-growing class in Michigan in whom its approach arouses the liveliest emotions of the round year. Because they know that the trout season opens on that day.

The trout season! What currents of happy anticipation it sets in motion! what longings lift in the soul! what desires swell the heart! what iridescent bubbles of hope rise to the surface of the mind, whereon with a wonderful magic are painted scenes and pictures and visions and images that the craftiest hand of man never fixed, but which the deeper inner sight depicts with the perfect distinctness of accurate realism.

To those who know not the inner cult all this is absurd—to the trout fisherman it is a solemn truth rising almost to the seriousness of a deeply impressed religion.

These are the visions the old trout fisherman sees in the dreams he dreams at his desk, in the factory, in the store, on the street, in all his active duties—the sub-conscious structure that rises like a fairy palace, but holds its place and form like a tower of granite. The limpid stream swiftly hurrying over its bed of sand or gravel, gurgling over sunken logs, swishing around the roots of old stumps, deftly touching and swaying down-bending boughs, noisily rattling down boulder-strewn inclines, diving deeply and silently under overhanging banks, breaking into foam and lace-like strips of white water on the rocky riffles, but ever gently pushing the slow-wading, lone angler on and on to some unknown and never reached goal, the tracery of the trees against the deepest of deep blue skies, faint

green of spring touching daintily every twig; little slants and bars and slivers, and sometimes broad sheets of most golden sunshine; often the half-hushed note of a nest-building bird, perhaps a surprised mink on the water's edge or a soft-eyed doe stealing down to drink, occasionally the deep resonant throb of the rolling war drum of the ruffed grouse far away in the woods; the soft beds of mosses along the brink, the green early things that spring from the rich mold, the vagrant unknown flower that shrinks beneath the ghostly birch—and above it all the voices of the water, talking through the long afternoon, plain to those whose ears are taught to hear, gossip of the woods and the wild things, and of the secrets that nature hides away from men—except from those men who silently wander along the streams, deftly casting a string of bright-colored flies lightly ahead of them, hoping that it may haply fall at the doorway of the home of the brook trout.

This is what the dreamer sees when the first of May is near at hand. This is trout fishing in Michigan.—W. J. Hunsaker in *The Gateway*.

## Legislation at Albany.

ALBANY, April 9.—Governor Odell has signed the bill of the Senate Committee on Forest, Fish and Game providing for the creation of a State park in the Catskill Mountains, in Ulster, Sullivan and Delaware counties.

The following additional bills have passed the Senate: Senate Committee's bill (733-1013), Constitutional amendment authorizing the Legislature to direct the removal of dead timber from burned areas in the Adirondack region for the purposes of reforestation.

Senator Malby's bill (538-1049), relative to fishing in certain waters of St. Lawrence county.

Assemblyman Wolf's bill (S. Pr. No. 1033), relative to fishing in Jamaica Bay and adjacent waters.

Senator Brackett's bill (883-1197), relative to the close season for trout in Orange, Saratoga and Tompkins counties.

Senator Elton R. Brown's bill (917-1263), providing for the publication of the forest, fish and game law, as amended.

Assemblyman G. H. Whitney's bill (552-1794), relative to fishing in Saratoga county.

Assemblyman Graeff's bill (1267-1761), relative to fishing through the ice in Lake Champlain.

Assemblyman Pearsall's bill (321-1806), relative to taking fish through the ice in Chenango county.

The Assembly has passed these additional bills: Assemblyman Bechtel's bill (1294-1792), relative to fishing in Richmond county.

Senator Malby's bill (538-1049), relative to fishing in certain waters of St. Lawrence county.

Senate Committee's bill (481-754), providing that no person shall take any wild deer between one-half hour after sunset and one-half hour before sunrise.

Assemblyman Cook's bill (1115-1470), relative to the close season for trout in Erie county.

Senator Le Fevre's bill (326-1041), relative to the close season for quail, woodcock and grouse in certain counties.

Assemblyman Sheldon's bill (1286-1784), relative to taking black bass.

Assemblyman F. C. Wood's bill (792-1832) providing for restocking the Adirondack region with wild beavers.

Assemblyman Cook's bill (1178-1594), relative to gray squirrels.

Senator Elton R. Brown's bill (472-852), prescribing a method for acquiring land and water for State hatchery purposes.

# CANOEING

A. C. A. National Meet, Sugar Island, Thousand Islands, St. Lawrence River, August 5-19, 1904.

## Duquesne C. C.

BY H. W. BREITENSTEIN, DUQUESNE, C. C.

THE Duquesne C. C. was organized September 25, 1897, with eight names enrolled: S. B. Hughes Commodore; H. E. McLain, Vice-Commodore; B. Danger-

The Home of the Duquesne C. C.

field, Jr., Secretary-Treasurer; H. A. Ross, S. B. Evans, G. R. Graham, H. W. Breitenstein, T. W. Shepard. The national colors, with burgee, a blue field and horizontal white stripe, containing in red the letters D. C. C. were adopted.

This small band with five names added, constituted

the charter membership, and in the following June, 1898, the club bought the Pittsburg Y. C.'s house-boat, which they moored in a small cove at Brilliant Station, on the Allegheny River, a very pretty pool of two miles to the islands. There the missionaries worked faithfully in the cause, with only three converts the first season. The fleet consisted of two 16ft. cedar boats and one 20ft. basswood.

At the annual election, January, 1899, the following were re-elected: Com., S. B. Hughes; Vice-Com., H. W. Breitenstein; Sec'y-Treas., R. L. Demmler. During this year the membership increased to about twenty, and the fleet to seven canoes, a number of the original members dropping out or losing interest; there was but little enthusiasm.

For 1900, S. B. Hughes was re-elected Commodore, H. W. Breitenstein Vice-Commodore and W. C. Weckerle Secretary-Treasurer. Soon after Commodore Hughes resigned office, and H. W. Breitenstein was elected to succeed, and H. E. McLain to Vice-Com. The membership gradually decreased and no new ones were admitted. The ice-damaged house-boat had to be beached, and the outlook generally was gloomy.

For 1901, officers for the year were: Com., H. W. Breitenstein (re-elected); Vice-Com., J. Wein; Sec'y-Treas., W. C. Weckerle. The election was held after a powwow of the six members who attended the meeting which was called to discuss disbandment. The vote resulted in the determination to reorganize and be a canoe club, or go broke. At a subsequent meeting all dead-woods were asked to resign, and the remaining few, with only three original members left, pledged enough money to buy property and build an up-to-date club house, which resulted in the present home of the club, now a chartered organization and a full membership. The club colors, adopted by the new organization, is a gold field with a design of the Allegheny, Monongahela and Ohio Rivers and Fort Duquesne in black.

The club house was initiated July 4, 1902, by an annual meet of the American Canoe Association Central Division, and is situated at the foot of a long, winding pool on the Allegheny River, at Sylvan Station, ten miles from Union Station and accessible by trolley cars also. The surroundings are picturesque, the Allegheny being second to none for beauty, and very popu-

The Pool—From the Porch of the Duquesne C. C.

lar as a resort of the members, some of whom live at the club during the season.

In 1902 the club re-elected H. W. Breitenstein for Commodore, H. E. McLain for Vice-Commodore, and W. C. Weckerle for Secretary-Treasurer.

In 1903 W. C. Weckerle was elected Commodore, F.

C. Demmler Vice-Commodore and A. W. Heeren Secretary-Treasurer, and enjoyed a very successful season. Most members are also enrolled on the A. C. A. register.

The officers for 1904 are Com., F. C. Demmler; Vice-Com., E. H. Demmler; Sec'y-Treas., A. W. Heeren. The club's fleet now contains 30 canoes, mostly open paddlers.

### Cruising on the Allegheny.

WITHOUT a doubt the Allegheny River is one of the most beautiful of our larger streams, and to the canoeist, who does not require dangerous rapids, a paradise.

During the past summer Parde and I boarded the night train on the B. R. & P., at Allegheny, and next morning at 5 o'clock, by special arrangement, had it stop at Carrollton, frightening the operator, who was roused from a sleep by the unwonted stop, thinking he had blocked the road.

Cold, densely foggy and sopping wet, it was a very cheerless morning. After a similar breakfast, we shouldered the canoe, then the duffle for the carry to the river. Embarking, we drifted, listening for fast water ahead. Gradually the light breeze dissipated the fog, and by 9 o'clock we were enjoying one of the most glorious of days. Bright sunshine, bird music everywhere, and a most riotous profusion of wild flowers in gorgeous splashes of color; the river winding among the steep wooded hills, and we in high spirits at being free from the daily pall of our smoke-laden atmosphere, was a combination to put any grouch in a good humor.

With idling, sneaking into every creek's mouth to observe animal life, a halt for lunch and an occasional

feel more or less the proprietorship of one's surroundings. While the upper river, after reaching the high hills, is undoubtedly the more beautiful, the lower part is not without its special charms, and I never tire of loafing throughout its length.

When within ten miles of Pittsburg, you will find

"Sunshine and Shadow"—A Scene on the Allegheny.

the open door policy as interpreted by the Duquesne C. C., where I hope no worthy canoeist will ever feel a chill. Although near the city, the surroundings are very attractive, and many spots are dear to the Duquesne, whose gay parties often make the hills ring in echo where midnight cruises are the most charming stunts

The Allegheny near the Duquesne C. C.

on the programme with the steak broils an enticing second. It is there you'll find "Tis always fair weather," etc.

At Pittsburg you will find the confluence of the Allegheny and the Monongahela forming the Ohio; once a scene of forest and stream, now a smoke-be-

A Quiet Day on the Allegheny.

grimed home of cliff-dwellers, denuded hill and cinder-curbed streams in which we still find marks of beauty. BEAVER.

### CANOEING NEWS NOTES.

OAKLAND C. C.—The Oakland (Cal.) C. C. has elected the following officers: Charles Stewart, Commodore; H. G. Hinckley, Vice-Commodore; Charles L. Taylor, Jr., Secretary and Treasurer; S. A. Hackett and F. B. Bain, Committee on Membership. At the annual meeting a committee was appointed to arrange races in which the Canoe Club, the Encinal Yacht Club and the Olympic Canoe Club will take part during the coming season. The races will be similar to those held last year between the craft of the three clubs.

THE Camp Site Committee of the Eastern Division for the season of 1904 has been appointed, as follows, by Henri Schaeffer, vice commodore, and Edward B. Stearns, purser:

Perry H. Dow, Cygnet, Manchester, N. H., chm.  
Paul Butler, Vesper, Lowell, Mass.  
A. E. Kimberley, Lawrence, Lawrence, Mass.  
B. F. Jacobs, Jr., Medford, W. Medford, Mass.  
H. M. S. Aiken, Quinobequin, Boston, Mass.  
W. R. Wescott, Cygnet, Manchester, N. H.

### To the Members of the A. C. A.

Gentlemen: During the time that I was chairman of the camp site committee last year, I sent circular letters to the members of the Association, stating that because of the extra building necessary to start our occupation of Sugar Island, which the Association purchased in 1901, a larger amount of money than usual would be required, and asking for contributions of \$1 or more from those who felt inclined to contribute.

A number of the members contributed very generously, and money still comes in occasionally, but there is still a large amount owing, and thinking that it might remind some of you who have not as yet contributed, I thought it best to jog your memory in this way, and hope that many more may be induced to send me contributions.

For the first time I herewith append a list of those who have contributed to date. (There may be possibly two or three names omitted, and if there are, I ask pardon for the omission, and beg that they inform me of it.) I do not mention the amounts each one gave, but they ranged from \$1 to \$100. Do not fear that you will be called upon for such extra subscriptions each year, for you will not, as the island is pretty well arranged for camps, and the dock, ice house, kitchen and store are built and, of course, will not have to be provided again. We also have a number of productive assets, such as a number of floors, lumber, cots, blankets, etc., which nearly cover the deficit, so that when this deficit is paid, the Association will certainly be in a flourishing condition, with respect to its island home.

Hoping that many of those who read this letter and

On the Upper Allegheny.

to whose attention the matter is brought may still contribute, I am,

JOHN S. WRIGHT,  
Secretary-Treasurer.

The following contributed to the Camp Site Fund:

H. C. Allen,	Karl F. Kilhoffer,
H. M. S. Aiken,	H. D. Keyser,

"A Rugged Shore"—On the Allegheny.

one to draw some Indian into conversation, generally a fruitless effort and a parley with a bunch of friendly Indians—at least one of the girls said they were—who were camping on the reservation, we put in a memorable day. A very picturesque camp on one of a group of islands with the rushing river singing sweet melodies, a generous and cheerful camp-fire and the pipe of peace which, with complete companionship, makes a benediction, made a night as perfect as the day. What would you more?

Day after day, content, idling or paddling as our mood.

Now on the deep and calm of a pool,  
With flowered shores and shadows cool,  
So cool, so cool, so cool, so cool—  
Then down with a rush on waters white,  
That leap and dance in laughing flight,  
That dance in laughing flight;

Or, drifting at ease under the sky,  
Wondering not, nor caring why—  
Nor caring why, nor caring why;  
Kissed by the winds that idly blow,  
O'er changing tides at ebb or flow,  
O'er tides at ebb or flow.

We were sorry when our six days ended, and would have preferred doing the same over again, to going to the A. C. A. camp on Sugar Island, but as we wanted to see the boys, reluctantly packed our equipment and shipped it home.

Perhaps our equipment would be of interest to the amateur cruiser. With two pieces of rubber cloth we decked the ends of the canoe (have now two false decks which can be slipped on and held in place by two elastic cords under the gunwales), and a few cross sticks and a rubber poncho made a small tent large enough to sit in upright, and with a cross board for a table—a cozy dining room when raining.

From Oil City where our cruise ended, down to Pittsburg, is 132 miles, from there up to Carrollton something over 100. The most frequent cruise is that from Oil City to Pittsburg. It is more accessible and makes a grand week's outing. On this stretch of valley are some of the finest scenes on the river, probably the most notable is the narrows from Red Bank to Mahoning. In this deep cut are "Camp Sans Souci" whose owners have extended the most wholesome hospitality one meets with, and "Camp Belle a l'Eau," whose genial owner you'll probably meet at the Hotel Reynolds, in Kittanning. While the river flows through a fairly populous country the hills are mostly wooded, and often one sees very little life in the valley, and one can

## Camping and Canoe Cruising in Canada.

BY R. W. ASHCROFT.

(Continued from page 800.)

For the benefit of those who are not as well acquainted with the Canadian farmers as we are, let me say that they are the squarest lot of men, as a class, that one would want to meet. It always pays to leave the price of a portage to them. Don't bargain with them beforehand. Don't say: "Will you do so-and-so for such a price?" Wait till they've portaged you, and then ask: "What's it worth?" and pay their price. It will be about one-half what you expected. Of course there are exceptions to the rule, and, once in a while, you are liable to make an error in judgment, just as the credit man of the firm does sometimes. But on the whole, it pays—at least in Canada.

As soon as we had portaged, we hastened to make camp near the river just above Elliott's Falls, as rain was due in less than half an hour. A neighboring farmer, on whose land we camped, sold us some straw, a chicken, some potatoes, butter and milk; and so we remember the spot as "Camp Chicken." We remember the bed of straw, too! Ostermoor mattresses may be more practical at home, and new-pulled hemlock or spruce bough or cedar tips more poetical in camp, but give me straw!

The head of our only ax broke off at this camp, which reminds me to counsel my readers to take two of these implements along.

It is a pretty little stream, that above Norland! The west bank, for the most part, borders fairly arable land; whereas, on the other side, the beech and the

terrestris. This small boy tipped off his friends, and soon a dozen urchins were digging industriously along the river bank. The Gaffer's pence began to dwindle, so he lowered his price to half, but the boys supplied bigger and fatter ones at the cut rate. Such a wind-fall had not come their way for many a moon. The Gaffer finally sought relief by disappearing from the scene, and the bottom thus fell out of the worm market.

He had not shown up when our canoes, etc., were loaded on a hay wagon, preparatory to a four-mile portage into Mountain Lake. Of two evils, we had chosen this, instead of a portage of similar length into the Horseshoe Lakes. Had we chosen heads, instead

Desert Island.

of tails, we would not have experienced about the only unpleasant incident of the trip.

We started without the Gaffer, thinking that probably he had gone on ahead and was waiting for us out of worm-sket, but we were mistaken. After we had gone quite a piece, his tall, lanky form showed up on the after horizon and we saw that he had a Winchester on his shoulder. It being close season for mountain sheep, we had thought it prudent to leave civilization with nothing more destructive than a revolver, to allay the suspicions of any over-zealous game warden who might be eyeing us. Still, a rifle was a comfortable thing to have around the tent, especially in the region whither we were bound, and we hailed the Gaffer's acquisition with delight. He said he got it from the restmstress, on the strength of his good looks and the desposit of a golden eagle. The Gaffer's veracity is unimpeachable.

Mountain Lake was a long time in coming, for we

After Seven-Mile Portage.

were tired and hungry, having had an early lunch. We could not reach the lake by the usual field, as the farmer owning it had sown wheat and we did not care to disturb it. So we journeyed on about a quarter of a mile, reached a likely spot, and were about to take down the bars of the fence, when we were met with a shrill: "Yez can't cross this here field," emanating from a scraggy, wild-eyed female brandishing a milking stool. "I'm a-going to stop these here portages! Yez come and take down the bars, and never put 'em up again, and the stock gets all over the place, and the deuce of a time I have in ketchin' 'em again. I won't stand for it no more!"

We set the Guv. at her. The Guv. is a ladies' man for fair. He's a past-master in the art of flattery. He quickly discovered this Canadian beauty's soft spot, for she soon blurted out: "Well, yez can cross for a quarter." Quick as a flash, four separate hands dived down into four separate pockets, and out came four separate quarters. Each of us would gladly have parted with a dollar, rather than walk a step further. The Guv's quarter was proffered to her, and, following up his advantage, he said sweetly, eyeing her milk pail: "And do you know where we could buy some milk this evening?" "Yez can have this, if yer want it," she said. "How much?" said the Guv. She asked ten times the market price of the milk, and she got it. But she got a reputation besides.

It rained hard that night, but we had straw to burn, so "Camp Hold-up" was a pleasant spot withal.

The description of scenery is not my long suit, so suffice it to say that Mountain Lake took my eye quite completely. It did not belie its name a particle. The reader must remember that every portage meant locating on higher ground, and this last four mile portage had put us fairly among the clouds.

We had been told not to expect much in the way of fish between the Mud Turtles and the lakes in the neighborhood of our destination, viz.: Hollow Lake; but we thought we would try our luck in Mountain Lake. One small lake trout was our only reward after a couple of hours' trolling. By this time we were at the portage at the head of the lake, and made it, and proceeded through Twelve Mile Lake into Little and

Big Boshkung. Passing under the bridge which carries the Meinden road over the lower end of Little Boshkung, we made diagonally across the lake to the inlet where the sawmill is located.

Fortunately for us, two lumbermen were at work there, or I wager we would never have made that portage that day. It consisted of a third-mile climb up a steep hill, and an eighth-mile descent to the next lake to the west of Little Boshkung. The sawmill is located at the foot of a narrow rapid tumbling stream emptying from one lake into the other.

The Gaffer and I thought at the time that this was the limit for a portage, but we don't think so now. By the aid of the lumbermen, we got over in fairly comfortable shape, and at once pitched our tent, although it was not 2 o'clock in the afternoon. Still, our weather sharp Zack prognosticated heavy rain for the balance of the day and for the night, so we decided to take time by the forelock and be prepared. It came down hot and heavy till dawn.

There is no outlet at the north end of the lake we embarked on this morning, and the canoeist must be careful at this point to proceed southwest for half a mile, and around the bend into Lake Kushog, which, being translated, means "The water that is narrow and long."

Although we had head-wind and a choppy sea, which made the Jonah canoe proceed rather gingerly, we had the best part of the lake behind us before we put ashore at noon for lunch. It was then we smelt big game for the first time this trip, discerning the tracks of deer, and also of bear, on the shore of the lake.

We sighted Ward's around a bend at the head of the lake on the western shore, and proceeded there "for orders." No one had been able to give us any information as to the lay of the land beyond Ward's, but

Camp Gibraltar.

one and all said: "Ask Ward, and he'll put you straight." We had a map, of course, but found it none too accurate.

Ward was away from home, and wouldn't be back till evening, so we decided to take a side trip to the island home of a hermit doctor thereabouts. Queer place for a doctor! Ideal place for a hermit! His island we found in the center of Senora Lake, which lake is reached by passing through the Narrows at the head of Lake Kushog.

[TO BE CONTINUED]

### A. C. A. Membership.

THE following have been proposed for membership to the A. C. A.: Harry A. Whitton, Clarence S. For-saith, both of the Cygnet C. C., of Manchester, N. H.;

"Full of Bass Holes."

W. E. Bertling and Finley H. Creen, of the Buffalo C. C., Buffalo, N. Y.

Vice Commodore Breitenstein has appointed the following as regatta committee for the Central Division, 1904:

H. E. McLain, Pittsburg, Pa.  
Greg. Rogers, Pittsburg, Pa.  
Hiram Hoyt, Rochester, N. Y.

NEWBURGH CANOE AND BOATING ASSOCIATION—The Newburgh Canoe and Boating Association will hold their annual regatta on Newburgh Bay, Hudson River, Saturday, July 23. The Regatta Committee is making an earnest effort to bring together the fastest boats along the Hudson. Unusually valuable prizes will be put up for the different classes and the visiting yachtsmen will be royally entertained at the club's summer camp.

Dr. Woodruff's Cabin.

maple, the pine and the cedar flourish uninterruptedly.

Tuesday morning saw us paddling north again toward Moore's Lake. This is a small sheet about a mile and a half in length, and half a mile wide, and takes its name from the first white settler who located in those parts and who is said to have been killed by hostile Indians. At the head of the lake are Moore's Falls, and at this point the road from Cobocunk to Minden crosses the water. There are several good bass holes below the falls.

The portage was easy, and the canoes were soon in the next northerly sheet of water, known as Gull Lake. This lake is very long and fairly narrow, and in navigating it, it is preferable to hug the western shore. If the wind is at all high, and from the west as it usually is, it is safer to follow the exact contour of the shore, and not cut across from headland to headland.

Playing Bass at Rosedale.

Minden River is exactly at the head of the lake. Its mouth cannot be missed, as it is to the right of about the only cultivated field on the shores of the lake.

It is an hour's steady paddling up the river to the town of Minden, which, by the way, is quite a metropolis for those parts. The Gaffer was even able to get the golden bridge of his eye glasses soldered by the local smithy, who also performed the more delicate operation of wedding our ax-head to another handle.

The Gaffer excited my intense and lasting admiration at this juncture by a wonderful display of executive ability. A villager informed him that worms did not grow any further north, so the Gaffer inspected his worm tin, and found that his stock of these delicious morsels had dwindled down to a few lackadaisical specimens that had exuded all the goodness they ever possessed in their erstwhile frantic endeavors to bore through good American tin. The Gaffer argued: "No worms, no minnows; no minnows, no bass; no bass, no fun," and thereupon hailed a small boy, and offered him a penny piece for good fat, lively Lumbrici.

# YACHTING

The merit of the measurement rule exploited over a year ago by the New York Y. C. is at last receiving proper recognition, and the club may now feel that its efforts to secure a good formula that might be universally adopted were not in vain.

For some years past yacht racing has been on the decline and the sport has reached almost as low an ebb here as it has in England. This state of affairs is due to various causes, but chiefly to faulty measurement rules. From the time the old Seawanhaka rule, which held sway for so many years, was abandoned, various formulas were adopted by the different organizations, but none of them served the purpose for which they were intended. As the different clubs were thus experimenting, matters grew steadily worse, and the situation reached a climax last summer when five different rules were in effect on Long Island Sound.

Old yachtsmen conceded that something must be done, but the first club to take up the matter in a thorough and systematic manner was the New York Y. C. This club appointed a committee of the ablest men that could be secured anywhere, and these gentlemen devoted themselves for months in an effort to devise a correct mathematical formula for the measurement of racing yachts. They conferred with prominent designers throughout the world and consulted all the existing data on the subject. In fact, to sum up in a few words, they made an exhaustive study of the problem, and the rule that was decided upon was one which was believed to be the best adapted to the purpose. The report of the committee was put before the members of the club and the rule which had been devised was adopted. No sooner had this been done than the club was criticised somewhat harshly by the press and by other clubs, some of which felt that they should have been consulted in the matter if the New York Y. C. were making an earnest endeavor to secure a rule which might become universal. The New York Y. C., however, felt that all efforts in this direction were more or less experimental in character and they wished to bear the entire blame provided the rule they decided upon was not practicable. The New York Y. C. rule went into effect last year, and only three boats were built under it. Yachtsmen were still a little skeptical and they hesitated about building until they were assured that several men were willing to take the step and that the classes would fill. The three boats that were built were the schooners Ingomar and Valmore and the sloop Pelligrina. The schooners did remarkably well in the racing, but Pelligrina was used solely for cruising. It is interesting to note that all three proved to be fine cruising vessels, and more than satisfied their owners in this direction.

As soon as the rule had been adopted by the New York Y. C. the Eastern Y. C. accepted it. This was the first step toward a general adoption and the securing of what bids fair to be a universal rule. The season of 1903 passed without giving the rule a really satisfactory test, in so far as the building of new boats was concerned. It was rather unfortunate that the rule should have been adopted in an America's Cup year, for the interest was centered in the international contest. As the season wore on, however, the rule was looked upon with less disfavor, the original framers were gaining more confidence and new supporters were found on all sides. Other clubs saw that the rule had unquestionable merit and that they were hindering the development of the sport and the building of new boats by adhering to old rules. Most yachtsmen felt that a good universal rule, even if it was not perfect, was far better than a number of indifferent ones.

The Atlantic Y. C. was the next club to join forces with the New York Y. C., for they adopted the formula last winter, with slight modifications in the factors. The Yacht Racing Association of Long Island Sound next accepted the rule, and they also ratified it with modifications in the factors. Thus all the Sound clubs were racing under one rule, with the exception of the Larchmont Y. C. and the Seawanhaka Corinthian Y. C. The members of the latter club saw that the tendency was now toward a universal rule, and they felt that it would be advisable to accept it also, for it would be obviously difficult to sail their club matches under one rule and the Association races under another. This leaves the Larchmont Y. C. alone, but as this club is not a member of the Associ-

ation, it was not so essential that they should accept the new rule.

The New York Y. C. formula is as follows:

"Length multiplied by the square root of the sail area, divided by 5.5 times of the cube root of the displacement."

All the clubs that have ratified the rule accepted it as here printed.

The New York, Eastern and Chicago Y. C.'s find the length factor as follows:

"The mean of the length over all, exclusive of bulwarks and rails, and of the length on the load water line, both measurements to be taken parallel to the middle vertical plane and at a distance from it equal to one-quarter of the greatest beam of the water line. \* \* \*"

In the case of the Atlantic Y. C. and the Y. R. A. of Long Island Sound, the length factor is obtained by different methods. The Association calculate the length as it is now done under the Hyslop rule, which is as follows:

"Actual water line length plus the excess, if any, of the beam measured  $\frac{1}{8}$  in from either end of the water line over the extreme beam."

The Association calculates the displacement in a slightly different manner, which, however, gives practically the same result. The sail area is measured, as was done under the old Seawanhaka rule, which is really a spar measurement. The Atlantic Y. C. arrived at the length factor in still another way, which is as follows:

"Length on the quarter beam line, 10 per cent. of the beam above the water line."

These several methods of calculating the factors embodied in the rule do not affect the formula in any degree, and for the present the variation of calculation is hardly an objection, for the practical application of these three methods will enable the experts to determine after a season which one of the several ways is best. The rule may have to be modified slightly, but now that a good basis to work on has been secured it is more than likely that an admirable rule will be the outcome and that the slight changes which may take place will not only be helpful in its development but will do much toward advancing it to a point of real perfection.

The Larchmont Y. C., which is perhaps the strongest racing organization in this country, has always conducted its fine races in an excellent manner, and substantial prizes have always been given. It has always been looked to as an advisory organization in racing matters in general. We have always felt, however, that for the benefit of the sport at large the club would do well to join the Association, for such a step could in no way injure the club and would certainly add to the Association's strength, and the two organizations could then work together without danger of conflict and with more singleness of purpose. All clubs should now join hands in a firm resolve to revive the failing interest in yacht racing, throw aside petty and personal feelings and do their utmost to encourage the building of racing yachts and the development of the sport, for it is for this purpose that they were organized.

The ranks of the racing men have been greatly thinned out during this lethargic period, for men have no desire to attempt to build a boat that will fit several racing rules. Many of the Corinthians have drifted to power boats during the last year or two, perhaps never to return to the racing sailing yacht again. This is not so much the case in the east as it is on Long Island Sound, where good boat-sailors are somewhat scarcer.

The Chicago Y. C. has accepted and adopted the New York Y. C. rule, and this seems to be the beginning of the general adoption of the rule on the Great Lakes and through the west. The Chicago Y. C. is a far-sighted institution and moves only after giving a subject due consideration, and its attitude as to the new rule is significant. If the rule works out as well as is anticipated on the lakes it is more than probable that the Canadian yachtsmen also will accept it, for these sportsmen are always on the lookout for changes that are really improvements, and they can always be counted upon to assist in any move which will be of benefit to the sport. The Gulf Coast Yachting Association now has in its membership several clubs whose combined strength is very great, and they are on the lookout for a rule which is better than anything yet introduced in their waters, and now that so many northern yachtsmen are to take their boats south in the

winter to race, it is, of course, essential that the same rules of measurement should apply to the racing there as in the north.

The only way we can ever hope to have really fair and satisfactory inter-club, inter-association and international races is by the adoption of a universal rule.

## Boston Letter.

Boston, April 11.—The second general meeting of the Eastern Y. C. for the year was held at the St. Botolph Club last Tuesday evening. At this meeting it was voted to purchase the wharf property on the town side of Marblehead harbor, now used by the club as a landing station. The transfer of the property at this time is merely a matter of form, it being understood at the time the wharf was bought that the purchase was made for the Eastern Y. C. The regatta committee announced one of the best list of fixtures that has been arranged for the club in many years. It includes racing for yachts of all sizes, including three open races for automobile and power boats. It is also contemplated holding an ocean race from New York to Boston on July 6, if there should be sufficient number of entries to warrant starting the boats. In this proposed race there will probably be an opportunity for yachts to compete which are barred under the rules of the Lipton cup race, to be held under the auspices of the Brooklyn Y. C. It is understood that several Massachusetts yachtsmen, owning yachts of more than 40 feet over all in length, are desirous of competing in such a race. This year a cruise has been arranged along the coast of Maine as far as Bar Harbor, where the Eastern Y. C. has a station. There will also be a race at Bar Harbor. The cruise will be one of the best that the club has held in years. As the cruise to the eastward will be of considerable extent, the fleet will probably not cruise to the westward in squadron order to join the fleet of the New York Y. C. The complete list of fixtures announced by the Regatta Committee is as follows:

July 2, Saturday—Open race for E. Y. C., classes J and K, and Y. R. A., classes D, E and I.

July 2, Saturday—Squadron run to Gloucester.

July 4, Monday—Automobile and motor boats, open, A. M.

July 4, Monday—Open race for E. Y. C., classes J and K, and Y. R. A., classes D, E and I.

July 6, Wednesday—Start of ocean race from New York to Marblehead.

July 9, Saturday—Automobile and power boats, open.

July 15, Friday—Annual regatta.

July 15, Friday—Rendezvous for cruise at Marblehead, captains' meeting on board flagship.

July 16, Saturday—Start of annual cruise and run to Gloucester.

July 17, Sunday—Squadron run, Gloucester to Isles of Shoals.

July 18, Monday—Squadron run, Isles of Shoals to Peak's Island.

July 19, Tuesday—Squadron run, Peak's Island to Boothbay.

July 20, Wednesday—Squadron run, Boothbay to Islesboro.

July 21, Thursday—Squadron run, Islesboro to Bass Harbor.

July 22, Friday—Squadron run, Bass Harbor to Bar Harbor.

July 25, Monday—E. Y. C. regatta at Bar Harbor.

July 30, Saturday—Automobile and power boats, open.

August 1, Monday—Open race for E. Y. C., classes J and K, and Y. R. A., classes D, E and I.

August 18, Thursday—Open race for E. Y. C., classes J and K, and Y. R. A., classes D, E and I.

August 19, Friday—Open race for E. Y. C., classes J and K, and Y. R. A., classes D, E and I.

During the cruise the fleet will lay over during one day at some port, to be arranged at captains' meeting after the start.

The annual meeting of the Dorchester Y. C. was held at the American House last Thursday evening, at which it was announced that the work of dredging on the south side of Dorchester harbor had begun. Commodore T. W. Souther showed an official blue print, on which was indicated the extent of the dredging to be done. Commodore Souther felt that the deepening of the water would prove of great value to the yacht owners. The work of dredging has commenced on the north side of the harbor, the work in this direction being explained by ex-Commodore Hawes, of the Savin Hill Y. C. When this work has been finished Dorchester will be one of the best anchorages for small yachts along the coast.

Throughout the winter dredging has been carried on in Dorchester Bay, at City Point. It is proposed to increase the depth of water along this shore, where the yacht clubs are located, and for a considerable distance out, to 12 feet at mean low water. This depth will be maintained inshore almost up to the sea wall,

With these improved anchorage facilities there is little doubt that there will be an increase in the fleet laying there. With sufficient depth of water this makes an ideal anchorage, being handy to the yacht clubs and also being free from the inconvenience of sooty rigging and sails which has to be put up with by yachts that now have to anchor in the deeper water nearer the city; while the handiness of the anchorage to the city makes it of great advantage to yachtsmen who steam back and forth to their summer homes every day.

At a meeting of several owners of catboats, enrolled in the Quincy Y. C., last Tuesday, it was decided to hold a long-distance race for these boats on June 25, the same day that the 22-footers and other classes are to race from Marblehead to the Isles of Shoals, under the auspices of the Boston Y. C. It is proposed to race the cats from Quincy to a stake boat off Thatcher's Island and return.

At a meeting of representatives of the Quincy, Wollaston and Squantum Y. C.'s it was decided to hold a series of interclub races, as follows: June 17, at Wollaston; July 2, at Squantum, and July 16, at Quincy.

Mr. Lawrence F. Percival's new speed launch, built by Messrs. Stearns & McKay, at the Marblehead yacht yard, was given a trial at Marblehead on Saturday, April 2, during which she failed to show the speed that was expected of her. She was hauled out Monday, when it was found that several fathoms of lobster buoy rope, together with the buoy itself, had become entangled in the propeller and around the strut. It bent the blades of the propeller backward, tearing off the strut. She was given another trial last Thursday, with an experimental propeller. She developed good speed at times, although, owing to the newness of the engine, it was run at less than half power, and a defective commutator prevented more than two cylinders doing effective work. The results were encouraging, however, and it is hoped that with the final propeller, which will be tried in about a week, the boat will show as much speed as can be combined with seaworthy qualities in a launch of her size.

Rear Commodore Walter Burgess' new 21-footer, Clarita, the only boat to be built during the winter for the newly adopted Y. R. A. of Mass. 21-foot class, was launched at the Marblehead yacht yard last week and was given a trial last Wednesday. In a light easterly breeze she moved very fast, and, as it freshened, she carried her sail very comfortably.

On Tuesday, April 19, the fleet of new and old 18-footers at Duxbury will be given a tryout in an informal race. Three new boats were built during the winter at Kingston, and there are several older boats laid up that are very fast. It is expected that the race will be an interesting one. JOHN B. KILLEEN.

### Mimosa II.

THE keenest racing that was seen last season between boats of moderate size was found in the 43-foot class. The two new boats Mimosa II and the Gardner production Aspirant met in a number of contests, and the racing could hardly have been better. Aspirant, owned and sailed by Messrs. Addison G. and Wilmer H. Hanan, carried off the honors, but the racing was close, and Mimosa II pushed her hard for first place.

Mimosa II did not suffer from lack of handling, but her defeat may be attributed to a number of things. Aspirant was skinned out below and she did not have any interior fittings, while Mimosa II was loaded down with partitions and other equipment, weighing considerably over a ton, which did her harm. Had these been removed and the equivalent weight been put on the keel it would have vastly improved her.

The two boats will no doubt meet again this year, and as Mimosa II will be seen in an improved condition the racing ought to be more interesting than ever.

Mimosa was designed by Mr. B. B. Crowninshield and built by the George Lawley & Son Corp., South Boston, Mass., for Mr. Trenor L. Park, of New York City. Below she is quite roomy, and from the cabin plans it will be seen that she has all the comforts of a cruising boat.

Her dimensions are as follows:

Length—	Over all	62ft. ¼in.
	L. W. L.	41ft.
Overhang—	Forward	9ft. 2in.
	Aft	11ft. 10in.
Breadth—	Extreme	12ft. 15½in.
	L. W. L.	11ft. 6¾in.
	Transom	4ft. 11½in.
Draft—	Extreme	8ft. 8¾in.
	Fairbody	3ft. 3in.
Freeboard—	Stern	4ft. 4¼in.
	Least	2ft. 6¼in.
	Transom	3ft. 2¾in.
Areas—	Midship section	30 sq. ft.
	Rudder	17.80 sq. ft.
	Total lateral plane	181.80 sq. ft.
	Total wetted surface	735.30 sq. ft.
Sail area—	Jib	340 sq. ft.
	Staysail	321 sq. ft.
	Mainsail	1,501 sq. ft.
	Total	2,162
	Area, together with jib and gaff topsails	2,577
	Sail area, rated under Y. R. A. of L. I. S. rules	2,597

ATLANTIC Y. C. ENTRY ACCEPTED.—Mr. T. Alfred Vernon, of the Atlantic Y. C., has received a letter from Mr. R. W. Rathbone, Chairman of the N. Y. Athletic Club Yachting Committee, in which he states that the Mr. J. B. O'Donohue's entry of the sloop Adeline for the race to Block Island has been accepted.

MIMOSA II.

### YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

THE FIFTEEN-FOOTERS FROM A MASSACHUSETTS STAND-POINT.—This most interesting and critical article that appeared in our last issue was written by Mr. William Lambert Barnard, of Boston. Mr. Barnard will be remembered as the author of the cruise that won first prize in our recent cruising competition.

SAPOLIO Y. C.—The Sapolio Y. C. held its annual meeting on March 31, and the following officers were elected: Com., Samuel Kolischer; Fleet Capt., Dave Helsman; Treas., Joe Brenner; Meas., William Kuhn. The members are: Ike Heisman, Carroll Donohue, William Cleary, Harry Barend, William Dangman, M. McBride, Lewis Brewster, Joe Monday, Harry Cohen.

STEAM YACHT FALCON CHARTERED.—Mr. John P. Roberts has chartered his steam yacht Falcon for a short period, through MacConnell Brothers, to Mr. Joseph Cowan, of New York City. The same firm has sold for Mr. Richard H. Swartwout, of New York, the knockabout Raduga, to Mr. C. A. Hatch, of Stamford, Conn.

NEW BOATS FROM F. S. NOCK'S DESIGNS.—The following is a list of the new work Mr. F. S. Nock, of East Greenwich, R. I., now has on hand: Design for a 54ft. cabin launch (hunting cabin type) for Mr. W. S. Otis, of Providence, now in course of construction in his shops; a 35ft. speed launch for Mr. J. R. Harding, of East Greenwich, also in course of construction; a small sailing and rowing tender for Mr. Daniel Howland, of Hope, R. I., also building; design for a 36ft. hunting cabin launch for Mr. Fred W. Albru, of Kingston, Ontario; design for a 43ft. cabin launch for Buffalo Gasolene Motor Co.; design for a 35ft. hunting cabin launch for Mr. F. Babcock, of Centerville, R. I.; design for a 60ft. speed launch for Providence owner (name withheld); design for a 30ft. speed launch for T. A. Winslow, New Orleans; and a design for a small power boat, 20ft. long, for Mr. W. O. Towers, New York City.

CAROLINE PURCHASED BY SOUTHERN YACHTSMAN.—The fast and able Class A sloop Caroline, of the Inland Lakes Yachting Association, will be added to the fleet of the Southern Y. C., at New Orleans, La. Caroline was one of the fastest boats of the season of 1901, and she shared honors with such crack racers as the Anita and Adyrin. Caroline was sold by Com. F. H. Libby, of the Oshkosh (Wis.) Y. C., to U. J. Virgin through the agency of L. D. Sampson, Secretary of the Southern Y. C. She was designed and built by Jones & La Borde.

CORINTHIAN LAUNCHED.—On April 2 the new challenger, Corinthian, built for the members of the Corinthian Y. C., of San Francisco, was launched from the yard of the builders, W. F. Stone & Co., of Harbor View. The boat is the most extreme craft ever built on the Pacific coast. She is 56ft. over all, 24ft. waterline, 14ft. 6in. in breadth, 2ft. 7in. draft of hull and 10ft. draft with board down. The boat was designed by Messrs. Burgess & Packard, and she is fitted with a steel truss running fore and aft in order to properly strengthen her. Corinthian was built for a syndicate of members of the Corinthian Yacht Club, with the object in view of regaining the Perpetual Cup that was lost to the San Francisco club two years ago.

JAMAICA BAY Y. R. A.—The annual meeting of the Jamaica Bay Y. R. A. was held on April 5 and the following officers were elected: Chairman, Henry Lange, Old Mill Y. C.; Sec., E. V. Pardessus, Jamaica Bay Y. C.; Treas., George G. Boehm, Bergen Beach Y. C.

The delegates were not able to fix dates for their clubs' open races, so the matter was left open until they could confer with their respective regatta committees.

The course of the sloops in Association races was made as follows: Starting from off the Jamaica Bay Y. C.; thence to the red can buoy in Rockaway Inlet; thence to a mark in Broad Channel; thence to the starting line; sailed over once.

CAPT. ARTHUR H. CLARK'S YACHTING HISTORY TO BE PUBLISHED.—A history of yachting covering the period from 1620 to 1815 has been written by Capt. Arthur H. Clark, one of the oldest members of the New York Y. C. Capt. Clark has spent many years in securing data on this subject, and he is probably more familiar with the early yachting in England and Holland than any other man alive. From time to time Capt. Clark has picked up old and valuable prints illustrating the earlier types of yachts. The book will contain 112 full page pictures reproduced from those old prints. Capt. Clark's work is to be published under the direction of the New York Y. C., by Messrs. G. P. Putnam's Sons.

T. C. ZEREGA BUYS THE SLOOP PLEASURE.—Mr. H. O. Havemeyer has sold the sloop Pleasure through Mr. Stanley M. Seaman to Mr. Theodore C. Zerega. Pleasure was designed and built by the Herreshoff Manufacturing Co., in 1901, and is 64ft. over all, 44ft. waterline, 15.9ft. breadth, and 3.1ft. draft. Pleasure was champion of her class in 1901, '02 and '03.

EX-MAYOR LOW'S STEAM YACHT SOLD.—The steam yacht Surprise, used by Hon. Seth Low, during his administration as Mayor for daily runs between this city and his home, Rye, N. Y., has been sold to Mr. Dumont

MIMOSA II.—LINES AND CABIN PLAN.—DESIGNED BY B. B. CROWNINSHIELD AND OWNED BY TRÉNOR L. PARK.

MIMOSA II.—MIDSHIP SECTION.

MIMOSA II.—SAIL PLAN.

Clarke, New York Yacht Club, through the agency of Stanley M. Seaman, of New York. Surprise, ex-Wil-l-da, is a steel vessel, designed by H. C. Wintringham and built in 1899 by Pusey & Jones Co. She is 127ft. over all, 102ft. waterline, 16ft. 6in. beam, 6ft. draft, has a credited speed of 15 miles an hour.

**EDGEWOOD Y. C.**—The annual meeting of the Edgewood (R. I.) Y. C. was held a short time ago and the following officers were elected: Pres., Charles I. Brown; Com., Herman G. Posner; Vice-Com., William Gibbs; Rear-Com., Henry E. Smith; Sec., Harry Fulford; Treas., C. Fred Vennerbeck; Fleet Surgeon, Dr. James H. Prior; the board of directors consists of the officers with the addition of George H. Flint and W. P. Stowe. At a meeting of the boat owners, held immediately after the general meeting of the club, Albert C. Davis was re-elected Measurer, with F. N. Gammell as Assistant Measurer, and the following were elected the regatta committee: Chairman, A. C. Davis; Fred Gammell, Fred Snelgrove, Fred Griffith, C. Fred Vennerbeck. The Edgewood Y. C. is now the largest organization on Narragansett Bay, having a membership of 450. There are now 130 boats in the club fleet and some thirty more will be added during the coming season. The club house is paid for and the organization is now on a firm footing. Wanderer, noted as a racing boat, has been sold by her former owners, Messrs. Harvey and Dutée Flint, of Edgewood, who have two new boats coming for the 30ft. class. Of the new power boats this year, Mr. George R. Babbitt, of Edgewood; Mr. William Schedley, of Providence, and Mr. James T. Thornton, of Edgewood, will have new power boats, the boat of Mr. Thornton being 61ft. in length with a 40-horse power engine.

**THE HUNTINGTON MFG. CO.**, of New Rochelle, are now building: A 30ft. auto launch, 5ft. beam, for Mr. D. S. Morrill of Hartford, Conn.; a 31.9ft. auto launch, 4ft. beam for Mr. S. S. Thompson, through the Standard Motor Construction, whose engines are going in both boats; a 32ft. auto launch, 5ft. beam, for Mr. H. Newbauer, from designs by Messrs. Tams, Lemoine & Crane.

The 35ft. high speed launch for the American Ice Co. is on the ways ready to launch, complete.

The auxiliary yawl Rosalind was launched a few days ago. The cutter Saracen has been hauled out to be painted.

One of the dories built by this firm for members of the Philadelphia, was given a trial under sail on March 29. She sails very well and goes quite fast. They set very light on the water, and will probably use about 300 pounds in sand bag ballast except when they take about four men aboard. They are oak framed, cedar plank, lapstoked, galv. fastened. The sails were made by McClellan, of Fall River.

**COM. A. C. JAMES' APPOINTMENTS.**—The following appointments have been made by Com. Arthur Curtis James, of the Seawanhaka Corinthian Y. C.: Fleet Capt., Franklin A. Plummer; Fleet Chaplain, Rev. George R. Van de Water; Fleet Surgeon, Benjamin T. Tilton, M. D.

At the regular meeting of the Seawanhaka-Corinthian Y. C., held at the City Club, West Forty-fourth street, on April 5, the racing rules were changed to conform with those recently adopted by the Yacht Racing Association of Long Island Sound.

**LARCHMONT Y. C. FIXTURES.**—The Regatta Committee of the Larchmont Y. C., which is made up of Messrs. Charles P. Tower, Chairman, Howell C. Perrin and T. J. S. Flint, has arranged for the following races during the coming season:

Saturday, June 18, Spring Regatta, all classes.  
Monday, July 4, twenty-fifth annual regatta, all classes, and Class B races for Colt Cup.  
Saturday, July 16 to 23, race week.  
Saturday, Sept. 3, club race.  
Monday, Sept. 5, (Labor Day) fall regatta.  
Saturday, Sept. 10, club race.

**INDIAN HARBOR Y. C. FIXTURES.**—The Regatta Committee of the Indian Harbor Y. C. has arranged the following schedule of races:

Monday, May 30, Memorial Day—Open race for raceabouts, club handicap and race for club knockabouts.  
Monday, July 4—Open race for motor boats.  
Saturday, July 30—Annual regatta.  
Saturday, September 3—Fall regatta.  
Monday, September 5, Labor Day—Club handicap and ladies' day race.

**AUXILIARY SCHOONER ATLANTIC ASHORE.**—A brief report sent from Cuba by cable states that Mr. Wilson Marshall's auxiliary schooner Atlantic went ashore on April 6 at or near Havana. No details are given. Captain Carroll, who has been in charge of Atlantic during her extended cruise through the West Indies, has left, and Captain "Lem" Miller left New York on April 7 to take his place.

**NEW YORK Y. C.**—A special meeting of the New York Y. C. was held at the club house, West Forty-fourth street on Monday evening, April 11. A number of amendments to the constitution, bylaws, and racing rules passed at a previous meeting were approved and are now in effect.

**POWER BOAT DESIGNED BY MESSRS. TAMS, LEMOINE & CRANE.**—Mr. Clinton H. Crane, of the firm of Messrs. Tams, Lemoine & Crane, has gotten out plans of eight power boats that will be prominent in the coming season's racing. Two of these boats are being built at Wood's Yard, City Island. They are both 50ft. long and 5ft. 6in. in breadth. The planking on each is double, the inner skin being of cedar and the outer of mahogany. The construction is elaborate, combining light weight and great strength. One of the boats is for Mr. Clifford V. Brokaw, and she will be driven by a Smith & Mabley engine of 150 horse-power. The name of the other boat's owner is withheld, but she will be fitted with two 90 horse-power Mercedes engines. It is expected that both these boats will show a speed in excess of 25 miles an hour.

## Rifle Range and Gallery.

### United States Revolver Association.

**SPRINGFIELD, Mass.**—The following persons have secured a rating on the Book of Records and been awarded Association medals: George H. Wilkins, of the Myles Standish Rifle Club, Portland, Me., a bronze medal on the scores of 83, 83, 84, 81, 81, 81, 84, 80, 85, 86; a bronze and silver medal on scores of 85, 87, 89, 86, 88, 88, 89, 87, 86, 88. Silas E. Adams, of the Myles Standish Rifle Club, Portland, Me., a bronze medal on the scores of 84, 82, 82, 80, 81, 83, 84, 81, 84, 80. Wm. G. Krieg, of the Willow Rifle and Gun Club, Chicago, Ill., a bronze and silver medal on scores of 85, 89, 96, 86, 86, 86, 89, 91, 92, 92.

April 9.—The Washington Revolver Club shot a match, their second, with the Smith and Wesson Pistol Club, of Springfield; teams of eight men each, 20yds., Standard American target, 30 shots per man. The Washington men to shoot military revolvers and military ammunition. The Springfield men, any revolvers and any ammunition, and allow Washington 20 points handicap per man.

The match was at 20yds., offhand. The Springfield men used target revolvers and special ammunition. The Washington team, which is made up of marksmen of the National Guard of the District of Columbia, used the regular military revolver and service ammunition. As an offset the Smith and Wesson team gave their opponents a handicap of 20 points to the man, or 160 to the team. They shot a very close match last year under the same conditions. The Springfield team then scored 2,037 points and won by 29 points. Yesterday they dropped behind their last year's record by 39 points, which was largely due to the poor light. George F. Adams, of the local National Guard, acted as scorer for the Smith and Wesson team, and the official in Washington was an Inspector-General of Rifle Practice. The scores:

	Springfield.

### The Independent New York Corps.

Twenty-two members of the Independent Corps occupied the Zettler gallery on Friday night, April 8. Lambert Schmidt was high on the ring target.

Ten-shot scores, 25-ring target, two scores to count, possible 500: L. Schmidt 479, F. Liebig 478, Gus Zimmermann 478, J. Facklamm 476, A. Begerow 469, Geo. Zimmermann 467, E. Greiner 467, L. C. Hauenstein, Jr., 466, J. Bittscher 465, H. Koch 463, J. Schmidt 460, W. Soll 460, H. J. Behrens 454, J. Huhring 454, B. Eusner 453, F. A. Young 452, H. Zimmer 440, H. Kuhn 437, F. C. Halbe 418, A. Radler 409, E. Gartner 408, J. G. Bauer 405, A. Corse 403.

Bullseye target, 4in. carton, the best center shot to count, by measurement: F. Hiebel 13, E. Greiner 22, Geo. Zimmermann 37½, J. G. Bauer 40, A. Begerow 42, L. Schmidt 50½, J. Stuhling 51½, Gus Zimmermann 57½, H. Zimmer 63, H. Kabriske 71½, W. Soll 84, J. Bittscher 85½, H. Koch 95, F. A. Young 103, H. J. Behrens 117, J. Facklamm 129, J. Schmidt 139, B. Eusner 164, F. C. Halbe 200.

### Zettler Rifle Club.

The winter gallery shoot of the Zettler Club has only two more weeks to go to the finish. W. A. Tewes has such a lead that he is sure of first place on the list of winners. At the last shoot, on April 1, Tewes made 2451 in his 100 shots. Hansen was second with 2444.

Ten-shot scores, 25-ring target, distance 75ft., offhand; 100 shots: W. A. Tewes 2451, L. P. Hansen 2444, Geo. Schlicht 2421, A. Moser 2414, H. Fenwirth 2326.

Fifty shots: Louis C. Buss 1216, R. Gute 1213, Chas. Zettler, Jr., 1211, A. Kronsberg 1207, W. A. Hicks 1203, B. Zettler 1197, Chas. G. Zettler, Sr., 1191, E. Van Zandt 1196, H. C. Zettler 1189, Louis Maurer 1182, Aug. Begerow 1166, Geo. J. Bernius 1149.

Extra scores: A. Moser 1207. W. A. Tewes made a full score of 250 twice.

### New York City Corps.

The New York City Corps closed its winter gallery contest in the Zettler Bros. gallery on April 7.

Ten-shot scores, 25-ring target, distance 75ft.: Aug. Kronsberg 242, 244; R. Busse 243, 238, O. Schwanemann 235, 238; R. Schwanemann 231, 238; J. Facklamm 234, 230; H. C. Radloff 234, 234; B. Eusner 231, 231; Chas. Wagner 225, 229; Jos. Keller 225, 218; Wm. Heil 214, 207; Chas. Schmidt 213, 213; F. Keller 212, 206; A. Wiltz 216, 200; H. R. Caplan 196, 215; H. Vogel 198, 204; Geo. Schrotter 181, 190; E. Sonner 183, 185.

Bullseye target, 4in. carton, the best center shot to count, by measurement: R. Busse 18½ degrees, F. Keller 23, Ch. Wagner 28, Aug. Kronsberg 30, O. Schwanemann 36½, J. Facklamm 38, Jos. Keller 44, H. R. Caplan 46½, R. Bendler 48, R. Schwanemann 49, B. Eusner 56, Wm. Heil 59, H. C. Radloff 61, Ch. Schmidt 66, A. Wiltz 69, G. Schrotter 81, E. Sonner 101, H. Vogel 117.

### Rifle at Springfield

**SPRINGFIELD, Mass.**, April 9.—To-day Mr. H. M. Pope, at 200yds., scored 917 out of a possible 1,000. The score:

H M Pope.....	8	12	9	8	11	11	11	8	9	10—92
	8	9	10	9	9	11	10	8	10	9—92

\*Aug. 25-26.—Tarentum, Pa., Rod and Gun Club.  
\*Western Pennsylvania Trapshooters' League tournaments. C. G. Grubb, Sec'y, Pittsburg.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

We are informed by the secretary-treasurer, Mr. B. D. Nobles, that the Olean, N. Y., Gun Club has fixed upon May 24 and 25 as dates for a two-day tournament.

The next Indian tournament will be held at West Baden, Ind. The tribe announces that wampum, issued by the general government, will be added to the extent of \$1,000.

The Riverside Gun Club, of Topsham, Me., has elected officers as follows: F. W. Atkinson, President; E. C. Hall, Vice-President; Claude Strout, Secretary and Treasurer.

The secretary, Mr. E. L. Kipple, of Wilkes-Barre, Pa., informs us that the Hanover Park Shooting Association will hold a two-day tournament at targets on June 14 and 15. The programme will be issued later.

The Brunswick, Me., Gun Club, for its Fast Day shoot, offers a programme of six events, five at 20, one at 25 targets. Shooting commences at 1:30. The club desires that shooters keep in mind its Fourth of July tournament.

The Winchester Gun Club, of Detroit, Mich., announces that its fourth annual Decoration Day tournament will be held on the club grounds at Highland Park. The secretary-treasurer is Mr. T. M. Brodie, 233 McDougal avenue.

Teams of the S. S. White Gun Club and Hilltop Gun Club, twelve men on a side, 25 targets per man, contested on the White Gun Club grounds at Gorgas Station, Pa., on April 9. The Hilltop club won by a score of 242 to 214.

In the contest for the Monroe county diamond medal championship, at the shoot of the Rochester, N. Y., Rod and Gun Club, April 6, Mr. H. M. Stewart, holder, and Mr. Thomas F. Adkin tied on 94 out of 100, an excellent performance.

The North Camden Gun Club twelve-man team, on its grounds, defeated a twelve-man team of the Florists' Gun Club, of Philadelphia, last Saturday by a score of 260 to 257. Messrs. Bergan, of Camden, and Park, of the Florists', broke 25 straight and were high men on their teams.

We are indebted to Dr. J. B. Pardoe, secretary of the Bound Brook, N. J., Gun Club, for a photograph of the numerous beautiful silver prizes which are to be competed for at the club tournament on Saturday of this week, a particular mention of which was made in our issue of April 9.

On the grounds of the Keystone Shooting League, at Holmesburg Junction, Pa., April 9, Mr. Fred Coleman captured the I. W. Budd cup in the main event of the weekly shoot. In the 25-live-bird event, Coleman, Landis and Harrison killed 23. Messrs. Vandergrift and Lamb were visitors. The latter was high with a score of 24.

Mr. G. M. Wheeler, secretary of the Brunswick, Me., Gun Club, informs us that the dates of their forthcoming tournament have been changed from April 28 to April 21. Shooting will commence at 1:30. The programme will comprise 125 targets, all at unknown angles. Targets, one cent each. An invitation is extended to all.

The Hudson Gun Club, of Jersey City, N. J., has planned to give its members and friends a specially pleasant tournament on April 17. The signs indicate that there will be a large attendance and a good competition. The main event is a 100 target handicap, distances 16 to 20 yds.; targets 1½ cent to all. The secretary is Mr. James Hughes, 831 Pavonia avenue.

The Patriot's Day shoot of the Worcester, Mass., Sportsmen's Club, to be held on the club grounds at Shrewsbury, provides twelve events, nine at 10 and three at 20 targets, 65 cents and \$1.30 entrance; a total of 150 targets, \$9.75 entrance. Moneys divided 50, 30 and 20. Targets, 1½ cent. Shooting commences at 10 o'clock. Extra events if time permits. Sweepstakes optional. Dinner at 1 o'clock.

A carte postale, bearing date of April 7, informs us that Messrs. Schoverling and Welles are in New York again, after several weeks' sojourn in Europe. They further inform us that they have signed contracts, in a business way, the purport of which they will communicate to the public in the near future.

The Pittsfield, Mass., Rod and Gun Club have issued a programme of seven events for their spring tournament, fixed to be held on April 16. It comprises a total of 100 targets; total entrance of \$3.75. Shooting commences at 1:30. The Rose system will govern the division of the moneys. Sweepstakes optional. Loaded shells for sale on the grounds. Guns and ammunition shipped to the secretary, Dr. G. C. Hubbel, 150 North street, will be delivered on the grounds free of charge.

The programme of the two-day holiday shoot of the Penn. Gun Club, May 30 and 31, at Oakview Park, Norristown, Pa., provides like sweepstake events for each day, fifteen events, 10, 15 and 20 targets; entrance 50 cents, 75 cents \$1 and \$1.50. May 30 at 1:30 o'clock, is fixed for the six-man team contest, entrance \$6 per team, 25 targets per man; optional sweep, \$1. Shooting begins at 9 o'clock. Targets 1½ cent. Per cent. system of division. The secretary is Mr. A. B. Parker, Norristown.

In a contest at 100 targets, \$100 a side, on the grounds of the Freeport, L. I., Gun Club, Mr. John Hendrickson, a stenographer in the Long Island City Magistrate's Court, defeated the famous expert, Mr. S. M. Van Allen, of Jamaica, the scores being 90 to 83. This was something of a surprise to the shooting talent, as the match, as it referred to Mr. Van Allen, was considered as being in the nature of delicatessen. A return match has been arranged, time and place to be fixed upon later.

Mr. Frank E. Butler returned to New York on Thursday of last week after a long and active stay in the South, acting as the advance agent of the U. M. C. Southern Squad. In the trip he was promoted to the office of Colonel, and the title has perfectly withstood the wear and tear of constant use. Having thus proved itself, it may be considered as genuine. Mr. Butler, notwithstanding his arduous duties, gained six pounds in addition to his title, all of which goes to show that it pays to advertise.

At Philadelphia, on the Point Breeze race track, last Saturday, the last live-bird shoot of the season, so far as that ground is concerned, had a good attendance. A downpour of rain made unpleasant weather conditions. In the 10-bird event, \$5 entrance, of the fourteen entries, Messrs. Felix, Murphy and W. Charlton were high with 9. In the second event, Murphy was high man alone with 10 straight. Target competition will next engage the attention of the Point Breeze shooters. The first target programme was arranged for Thursday of this week.

Mr. J. S. S. Remsen, of Hempstead, L. I., won the Eastern individual target championship at Sheephead Bay, L. I., on April 6, with the excellent score of 93 out of 100. He shot with much grace of person and accuracy of aim, smashing his targets into dust. He has developed into a first-class shot, whether at targets or live birds. At Palm Beach, Fla., whence he returned recently, he was placed at 33 yds. in the live-bird contests which took place there every week. When the cup was delivered to him there was an outburst of applause, which indicated that his success was heartily popular.

The programme of the Interstate Association's trapshooting tournament, given for the Cumberland Park Driving Club, May 4 and 5, Nashville, Tenn., provides ten target events each day, five at 15 and five at 20 targets, \$1.50 and \$2 entrance, \$10 and \$15 added; a total of \$250 added money. Targets, 2 cents. Lunch will be served on the grounds. First class shells on the grounds. May 3 will be practice day. Guns and ammunition, prepaid and marked with owner's name, sent care of Gray-Dudley Hardware Co., will be delivered on the shooting grounds free of charge. That firm will present a beautiful silver loving cup to the amateur making highest average. Rose system, 5, 3, 2 and 7, 5, 3, 2. Shooting commences at 9 o'clock. The secretary is Mr. Chas. L. Eastman, 320 N. College street.

The secretary-manager, Mr. Fred E. McKay, writes us as follows: "On May 19, 20 and 21, we will hold, midway between the cities of Minneapolis and St. Paul, Minn., a three-day tournament at targets, and will add in the neighborhood of \$1,000 to the purses. This shoot will be open to all, handicaps ranging from 16 to 22 yds. Handicap committee will be selected from the shooters. Any one will be made welcome, and given a square deal. Minneapolis has had the reputation in past years of holding the best shoots of the year, and does not propose that this one will be any exception to the rule." Programmes can be obtained of the secretary.

Mr. C. G. Blandford, captain of the Ossining Gun Club, writes us as follows: "The next regular shoot of the Ossining Gun Club will be held on April 16, at 2 P. M. This will be the final practice shoot for the team preparatory to the team match to be held at Poughkeepsie on the 23d inst. The members of the club desiring to qualify for the team are earnestly requested to be on hand. The programme of our open shoot, to be held on Decoration Day, May 30, has seven events, three at 15 and four at 25 targets, entrance \$1.30 and \$2.50; totals, 145 targets, \$13.90. Professionals may shoot for targets only; a special prize to high gun, providing three or more shoot. The shooters making first and second high averages will receive \$5 and \$3 respectively. Shoot rain or shine. One money to every three shooters; class shooting. Shooting will begin promptly at 11. Leggett trap."

The excellence of the scores made at the Interstate tournament held under the auspices of the Bristol, Tenn., Gun Club, April 6 and 7, border on the marvelous. Mr. W. R. Crosby broke 195 out of 200 on the first day, and 198 out of 200 on the second day; a total of 393 out of 400, or 98¼ per cent. Messrs. H. B. Money, A. M. Hatcher and R. L. Peirce on the first day were second, high average with 193. Mr. R. L. Trimble was third with 188. On the second day, Mr. Peirce was second with 193, A. M. Hatcher third with 191. The Bristol team broke 74 out of its first 75 targets. Crosby broke 99 out of his first 100, and Hatcher duplicated the feat in his second 100. All of which, in addition to similar happenings elsewhere, go to show that general trapshooting skill has developed to a degree far above old standards. The 16yd. mark is too short a distance to test modern skill at targets. And yet, it would be much easier to evoke action to make the distance shorter than 16 yds. than to make it longer.

May 4 and 5 will be days of activity in the affairs of the Rochester, N. Y., Rod and Gun Club, for those are the tournament dates. The programme has ten events each day, 15, 20 and 25 targets, \$3, \$4 and \$5 added money. Entrance is based on ten cents per target. The totals each day are: Targets, 190; entrance, \$19; added money, \$38. Manufacturers' agents are invited to shoot for targets. Ship shells to McCord, Gibson & Stewart. Eggleston Hotel will be headquarters. Average moneys. On a separate trap there will be a 15-target re-entry handicap for a gold watch, valued at \$35; entrance 50 cents. The committee has the following members: Messrs. F. C. Cutting, T. F. Adkin and H. M. Stewart.

BERNARD WATERS.

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., April 7.—The warm spring sunshine, the regular monthly shoot, and two cups to shoot for brought out a good attendance to-day, and quite a lot of shooting was done. While several good scores were made, the shooting as a whole was very uneven, accountable by the fact that much experimenting was going on; nearly every one had "something new" to try.

In the race for the club cup, Winans was the lucky man, while Rhoades, after being tied by Du Bois for the Traver cup, succeeded in landing a winner with a full score in the shoot-off, in which event Rhoades needed but one more break to make the score a perfect one.

On Monday, the 4th inst., Claymark, who for a number of years had been one of this club's most active members, and at one time its secretary, bade all of his friends good-by and departed for Philadelphia, which place he will make his home, having business interests there. That the boys wished him success and pleasure in his new field, goes without saying.

Events:	1	2	3	4	5	6	7	8	9

Hans	17	3	20	19	3	3	22	
Smith	17	5	22	13	5	5	18	

The cup scores are the result of events 6 and 7 with added breaks. The Rhoades-Du Bois tie was shot off in event 8.

The Lehigh Rod and Gun Club.

BETHLEHEM, Pa., April 9.—The scores of the all-day shoot held April 7 by the Lehigh Rod and Gun Club, of the Bethlehem, are appended. The day was a fine one, and the shooters turned out in good humor. High average was won by Mr. J. Plcis, of Easton, with 159 out of 180. Mr. H. Schlicher, of Allentown, second, with 151 out of 180.

H. F. Koch, Sec'y.

New York Athletic Club.

TRAVERS ISLAND, N. Y., April 9.—In spite of the bad weather the shooters of the New York Athletic Club turned out strong to shoot for the J. P. Sauer & Son shotgun, which will be the prize of the series through April and May. Mr. R. A. Rainey captured the gun, as well as the April cup, and he tied with Mr. Greiff for first prize in the special handicap.

The main event, 50 targets, handicap, for gun resulted as follows: W. J. Elias (8) 33, J. D. Foot (10) 39, F. Barner (4) 40, King (15) 35, G. E. Greiff (3) 46, Capt. Nelson (8) 44, W. Land (4) 40, R. A. Rainey (8) 48, Sedam (8) 38.

April cup, 25 targets, handicap: W. J. Elias (4) 19, J. D. Foot (5) 20, F. Barnes (3) 23, King (8) 24, J. Nelson (4) 18, G. E. Greiff (3) 22, R. A. Rainey (2) 25, Dr. Brown (9) 14, W. Land (2) 17; Sedam (3) 20, Williams (0) 23.

No. 3, special handicap, 15 targets: Elias (3) 12, Barnes (3) 8, King (4) 12, Greiff (1) 15, Rainey (1) 15, Sedam (3) 13.

Mr. Rainey presented a cup, which will be shot for April 16.

Rohrer's Island Gun Club, Dayton, O.

DAYTON, O.—In spite of the bad condition of the grounds on April 6, the attendance was very good. At the club's regular shoot H. Oswald won the medal after a spirited shoot-off with J. W. Gerlaugh, J. Schaerf, and P. Hanauer. The scores:

Club medal shoot, 25 targets, handicap of extra targets to shoot at. The number shot at is in parentheses: H. Oswald (35) 30, A. W. Ryan (35) 23, P. Hanauer (29) 26, J. W. Gerlaugh (27) 25, J. Schaerf (31) 25, C. F. Miller (29) 24, W. E. Kette (35) 24, C. Ballman (35) 23, C. Smyth (29) 22, J. Donohue (35) 22, J. Sapp (35) 21, F. Cook (32) 19, A. R. Lehman (35) 13.

Five shoot-offs, 5 targets each. Hanauer and Schaerf dropped out in the first: Oswald 5, 5, 5, 5, Gerlaugh 5, 5, 5, 4.

Norwich Shooting Club.

NORWICH, Conn.—The trapshooting season of the Norwich Shooting Club is well under way, and the plans for the prize shooting will be announced within a week. The scores of the contest on Saturday, April 9, were somewhat affected by the rain and mist, and were as follows:

Events:	1	2	3	Events:	1	2	3
Targets:	25	25	25	Targets:	25	25	25
Olcott	19	16	15	Amberg	..	20	16

## IN NEW JERSEY.

## Hudson Gun Club.

Jersey City, N. J., April 10.—These scores were made at the last shoot of the Hudson Gun Club. The attendance was not as large as at the last shoot, but on April 17 we expect a big crowd.

There will be a 100-target event on this date for a handsome prize. The price of targets will be 1½ cent to all, and distance handicaps will be used. They will be from 16 to 20 yds.

If the day is fair we will give all shooters a good time.

## East Millstone Gun Club.

East Millstone, N. J., April 11.—The trapshooting season closed here with a merchandise shoot on April 2, which was very successful, although not largely attended. The visitors who participated in the shoot were the veteran Bissett, of South River; Nelson, of Brunswick Gun Club; Messrs. G. and F. Winthrop, of Tallahassee, Fla., and Mr. Carl Fleischman, of New York city. Bissett shot in excellent form, shooting the entire programme through at a 90 per cent. clip, which was a very clever performance on so windy a day. He won the .22cal. rifle and also leather gun case. Van Cleef and Wilson captured several of the other merchandise prizes, while Welsh was high gun of the home club and also largest winner of sweepstakes of the day. A large number of spectators saw a successful season brought to a close. The referee was Mr. Pace. Scorer, Mr. Swenson.

Events 2, 5, 12, 13, 14, 15, and 16 were sweepstakes. All others were for merchandise prizes.

F. W. REMSEN.

## Montclair Gun Club.

Montclair, N. J., April 9.—No. 10 was of special interest because of a match between Messrs. Fitch and T. E. Batten for a prize, Mr. Fitch conceding a handicap of 5. As will be seen by the scores, Mr. Batten won. Scores 25 to 24. Mr. Batten's win was a gift.

Event No. 1 was a handicap match, 25 targets. Geo. Batten and T. E. Batten tied for first place, and by previous arrangement the prize, one year's subscription to FOREST AND STREAM, was awarded to Mr. Winslow, who had the next highest score.

Event No. 2, was also a handicap match. Messrs. Crane, Kendall and Holzderber tied for first place, and on the shoot-off at 25 birds, Crane won, with a score of 22 broken. Prize, a pair of hunting boots.

Event No. 3, 20 doubles, was won by Wheeler, with a score of 17; prize, a box of shells.

Mr. Fitch made a score of 74 out of a possible 80, completing his shooting for the loving cup and tying Mr. Kendall's 232 out of a possible 250. Ties to be shot off next Saturday.

Very foggy toward the close; heavy showers.

Events:	1 2 3 4 5 6 7 8 9 10

No. 3 was at 10 pairs.

## Hell Gate Gun Club.

Carlstadt, N. J., April 6.—The main event of the Hell Gate Gun Club shoot for April was at 20 birds. Prizes won on doubled point handicap, for regular club race of 10 birds. Klenk and Selg divided first and second with 6 points each. Forster, Wolfe and Dietzel were third, fourth and fifth. Schorty, Belden, Trostel, Wilson and Brennan were sixth, seventh, eighth, ninth and tenth. Weber and Voss eleventh and twelfth. Hughes, Van Valkenburg, Meckel, Cresci, Garms, Bandendistel and Dannefer were thirteenth, fourteenth, fifteenth, sixteenth, seventeenth, eighteenth, nineteenth and twentieth. Dave, Newman and Wellbrock were twenty-first, twenty-second and twenty-third. Shappert, Fuchs and Schlicht twenty-fourth, twenty-fifth and twenty-sixth. Siebel and Gardella, twenty-seventh and twenty-eighth. Doherty, twenty-ninth. Muench and Cunningham thirtieth and thirty-first. The scores:

## U. M. C. Southern Squad Wind Up.

INDIANAPOLIS, Ind., April 2.—The Southern touring team caught up here with their forward man, Frank Butler, and a royal time they had. The only thing that marred the pleasure of the shoot was the strong wind, causing low scores. A side wind has a decided sweep across the local territory that adjoins this beautiful shooting park.

The worst troubled shooter on the ground was W. H. Heer. Taking into consideration the number of shoots that Heikes had engaged, Heer was compelled to break 94 to beat him out for the high average. So, when Heer tried out two 25s and got 21 each, it was a worse puzzle than ever. Billy did do a thing or two; he went to shooting high, and to his own surprise made the first 25 straight; then he went at it strong, closed the 50 with a 49, and the next 50 the same, a total of 98. This gives him the score of 395 out of the last 400 shot at. Look at the scores made by all the others shooting, then you will see what shooting he actually did. The scores:

Targets:	25 25 25 25 T'l.	Targets:	25 25 25 25 T'l.
Marshall .....	16 18 20 17—71	Britton .....	15 19 18 17—69

Heer .....	25 24 24 25—98	Nash .....	18 22 19 18—77
Fulford .....	24 22 23 21—90	Bell .....	18 20 20 24—82
Head .....	21 22 24 22—89	Moeller .....	18 22 18 22—80

Shooting at 100, Taylor broke 50, Dark 53, Dixon 72, Tripp 75, Allen 68, Dishman 76.

## Menominee Gun Club.

MENOMINEE, Mich., April 4.—The weather being quite spring-like and inviting, several of the boys got up their enthusiasm and met on the grounds back of the hotel for their first tryout. There was no let-up until 250 shots had been fired. Some good scores were made, that of Kane being the best. McQueen, of Bay City, was present, and helped boost the club he organized. Mr. F. H. Siefkin was on the ground showing up the new automatic rifle.

Match, 10 pairs: Juttner 17, Kane 19, Clough 11, Hammersmith 15, Woessner 12.

## Springfield (Ohio) Gun Club.

THE regular shoot of the Springfield, O., Gun Club was held on April 2. The attendance was good. The Young handicap medal was won by Young, with a straight score. Henderson won the first contest for the Wilson trophy, making a straight score also.

The club offers good sport at its amateur tournament next month; 180 targets on each day, a total of 360 targets divided into 15 and 20 target events. The \$50 added money will provide four high average prizes; open to all. Capt. B. Downs, Arthur Gambell and Rolla O. Heikes will handicap; 16 to 20 yds.

Events:	1 2 3	Events:	1 2 3
Targets:	25 25 25 T'l.	Targets:	25 25 25 T'l.

Young handicap medal shoot, 25 targets: Young 25, Poole 20, Downs 19, Miller 17, Henderson 15.

Event No. 4, Wilson trophy, 25 targets: Henderson 25, Young 23, Watkins 21, Poole 21, Shaw 19, Downs 19, Miller 17, Phillips 16, Rankin 18, Slough 13, Weaver 7.

## Middletown Shooting Association.

MIDDLETOWN, Del., April 9.—The last shoot for the Parker gun, donated by Parker Brothers, was held on the 7th inst. The competition in the series was quite close; therefore there was much interest manifested in this shoot. There was quite an assemblage of spectators. The gun was won by Ed. E. Massey. The poor scores, or, rather, showing, were due chiefly to the sliding handicap. When one of the shooters made a score he was handicapped by his score, as is shown by the handicaps of Parker gun event below. And we might say the 40yd. targets were a trifle stiff for most of the members, as the trapper was an ex-wheelman, and would send target after target from 45 to 60 yds., though the shooters would ask "his swiftness" to reduce the speed, he seemed to have but one gait, and there he stayed. This shoot was divided into eight events, and all members of the Association who desired to enter the contest were eligible.

The Winchester Repeating Arms Co. also donated one of their repeating guns, which was shot off at 100 targets. The shooting was also very close and exciting in this event, as Brother Martin did a 24 clip in his first 25, and did not stop leading until he got past the 75 mark. After the Winchester gun event, Dr. W. E. Barnard defended the gold challenge medal in the same old style, this being the fourth time he has defended it. The club has secured several new members, and they hope to increase the club membership considerably during the summer. Below are scores of the day's shoot:

Parker gun:	1 2 3 4 5 6 7 8	Total.
Events:	1 2 3 4 5 6 7 8	
S. E. Massey .....	22 14 20 14 19 .. 18 ..	107

Burris, 17 .....	24 17 17 16		

Gold challenge medal: Barnard 21, F. Pool 18.

## Cincinnati Gun Club.

CINCINNATI.—April 9 was a bad shooting day. Heavy showers of rain and a strong wind prevented as large an attendance as usual, and also kept the scores below the mark in some cases. In the cash prize contest, Faran and Linn tied for high gun on 44, Maynard second with 40. Gambell made an excellent score in this event, breaking 46, but did not shoot from his handicap distance, and was not competing.

Little practice shooting was done, and the boys were all through by 4 o'clock.

Cash prize contest, handicap, 50 targets; Gambell (16) 46, Faran (18) 44, Linn (18) 44, Maynard (19) 40, Block (18) 34, Pohlar (18) 33, Herman (16) 31, Falk (16) 29.

Additional scores were made April 8. Gambell, Dreihls, Ahlers and Medico shot a match in connection with this event, two high men out. The scores show that the two former got left:

Allowance handicap, 100 targets: Medico (12) 93, Williams (18) 94, Ahlers (10) 92, Gambell (10) 90, Dick (32) 100, H. Sunderbruch (40) 100, Dreihls 79.

## Gem City Gun Club.

DAYTON, O.—The club held its first medal shoot of the season on April 2. A large crowd was present. A strong wind kept the scores low. The club used a new handicap system, each member being allowed as many extra targets to shoot at as he missed in the first 25; high gun to win; thus Rike lost 8 out of 25 and shot at 33. Rike and Munbeck tied on 29, and in the shoot-off the former won. The scores:

Club medal shoot, 25 targets, handicap; number shot at in parentheses: Rike (33) 29, Munbeck (37) 29, Oswald (30) 26, Craig (29) 26, Spangler (28) 25, Breene (32) 25, Butler (40) 24, Bish (38) 24, Haas (40) 24, Wertz (35) 24, Taylor (34) 24, Suman (33) 24, Tibbals (35) 23, Kempert (28) 22, Cord (34) 22, Smith (34) 21, Clark (29) 20, Lenox (38) 20, Anway (40) 20, Schimer (37) 19, Keman (36) 19, Stiver (33) 19, Sapp (33) 18, Brandenburg (33) 17, Anderson (34) 17.

## Cleveland Gun Club.

CLEVELAND, O.—Twelve shooters took part in the semi-monthly shoot of the club. A strong wind made the conditions hard. Grant, Class B, was high gun of the day with 31.

Club shoot, 40 targets. The scores: Class A—Jack 28, Williams 25, Alex 20. Class B—Grant 31, Martin 27. Class C—Hopkins 28, Nepter 22, Mack 20. Class D—Sheldon 29, Hull 28, Wallace 20, Cannon 17.

#### Interstate Association Tournament at Bristol.

BRISTOL, Tenn., April 9.—The tournament of the Interstate Association, held on the grounds of the Bristol Gun Club, April 6 and 7, was remarkable and unique in several features. First, the Bristol crack team led off by breaking 74 out of the first 75 targets shot at. Second, W. R. Crosby broke 99 out of the first 100 shot at. Third, Mr. A. M. Hatcher broke 99 out of the second 100 shot at. Lastly, twenty-six contestants shooting through the entire first day's programme, made a grand average just a fraction under 90 per cent. This is probably a record-breaking score, as many of the professionals on the grounds frankly admit that they never saw such shooting before.

The weather conditions the first day were anything but favorable, a drizzling rain falling nearly the whole time the events were being shot. This, no doubt, helped to keep down the attendance somewhat.

Mr. W. R. Crosby was high gun the first day with a score of 195 out of 200. Messrs. H. B. Money, A. M. Hatcher and R. L. Peirce were in second place with 193 out of 200. Mr. R. L. Trimble was third high gun with 188 out of 200.

The second day was much more favorable for shooting purposes, and several new faces were seen at the firing points. W. R. Crosby kept up his good work of the first day, and was again high gun, with the remarkable score of 198 out of the 200 shot at, and right here I wish to say that the targets were not easy at that. R. L. Peirce was second high gun with 193, and A. M. Hatcher was in third place with 191.

The arrangements at the grounds were found convenient, and the contestants expressed themselves as well pleased with the attention and consideration shown them by the local club members. A Leggett trap and one set of expert traps, Sergeant system, were used, and both gave the best of satisfaction. This was the first experience of most of those who took part in the tournament with the Leggett trap, and many were outspoken in their praise of its working.

There were few spectators present the first day, due no doubt to the inclement weather; but the second day they were out in force, among them being many ladies.

Several extra events were shot each day after the close of the regular programme. The scores of the regular and extra events follow:

#### Wednesday, April 6, First Day.

#### Aquidneck Gun Club.

NEWPORT, R. I.—After ten days' energetic work, the club is now located on its new grounds, with traps installed, platform down and all ready to entertain members as well as visiting shooters.

Opportunity was had on Wednesday to receive two of the latter, as Messrs. Neaf Apgar and T. H. Keller, Jr., attended the opening shoot on that day. Good weather was the fortune of the club, and some excellent work was done, particularly by Apgar, he scoring 94 in 100.

The occasion was also the twentieth shoot for the L. C. Smith badge, which was won for the shoot by Alexander, with the very good total of 43, his high mark in the medal matches thus far. The scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	Shot
Targets:	15	10	10	10	10	10	10	10	25	15	at.

The *FOREST AND STREAM* is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

### STATE GAME REFUGES.

Two interesting letters which we print this week call renewed attention to the desirability of action by State and city governments toward the preserving untouched of wild areas of country, and the making such wild areas attractive by introducing and protecting the various creatures native to the soil.

It is generally known that, for economic purposes, great tracts of the United States public domain have been set aside and reserved as preserves of one sort and another. The forest reserves of the Federal Government aggregate more than sixty million acres, but it is not generally known that nearly 1,700,000 acres of land have been set aside by some of the States as State parks, State forest reserves and preserves, State forest stations and State forest tracts. These, however, are found in only a very few States. Pennsylvania has more than 300,000 of these acres, New York 1,250,000, California a little more than 40,000, Michigan more than 57,000, Minnesota more than 20,000 and Massachusetts less than 15,000. These areas are, as stated, of State creation, and must not be confounded with the measures introduced in Congress looking to the establishment of a national park in Minnesota and another in the Appalachian range.

All the States of the Union agree that the game should be preserved, and pass laws to that end, but along with the preservation of game should go also the establishment of localities where that game may live and thrive, free from molestation, and even from fear of harm.

To the average human being, living wild animals are, of all things, the most attractive. Who does not remember the circus and the menagerie of his youth, and his joy to-day in watching wild creatures undisturbed? It is quite within our power, if we wish it, to have within easy reach of us haunts of these wild creatures, where they shall be so free from fear that we may see them at almost any time. Examples of the natural tameness of all wild creatures are so familiar that they hardly need be cited. The game in the Yellowstone Park, the wild ducks in certain preserved sections of Florida, the water fowl of far Laysan, the wild fowl which in their migrations continually alight with the domesticated wild fowl in the New York Zoological Society's Park in the Bronx, all show very clearly that what we in our stupid, civilized way call wild creatures are really not wild creatures, but are fellow beings only too glad to live with us in peace and amity if we will permit it. Wildness—meaning fear of man—is an acquired habit.

In every State in the Union there are great tracts of land unoccupied and useless in the sense that they make no financial return—yield no income—to their owners. Such lands, as so often said, ought to be purchased by the State, and, being left in their present condition of wildness, might be stocked with native game. The cost would be trifling—the mere fencing of the tract, and the wages of men who should patrol it—but the return in pleasure, in interest to the citizens of the different States, would be very great—absolutely out of proportion to the cost of the park.

Massachusetts—usually in the van where progress is concerned—has seen the wisdom of such a course and has established no less than twelve reservations of this nature. Some of them are very small, being little more than twenty acres in area, others much larger, as the Bluehills reservation of 4,850 acres.

The time is coming when the public of the different States will demand action of this sort by their legislators, and the sooner that time comes the better for all of us.

The character of the land to be set aside will, of course, vary in different sections of the country. In New England and the East such lands are likely to consist largely of barren mountain sides, increased, perhaps, by areas

of abandoned farms. In the West, marsh lands which are irreclaimable and liable to frequent overflow, may fitly be set aside in the same way, while the South possesses great areas of canebrake and low land subject to overflow, which might be made parks and preserves. The subject is well worth attention and careful thought by all our readers.

### NEW JERSEY PROHIBITION.

THE shooting of "fowls, pigeons and birds," after the manner commonly known as trap shooting, is made unlawful within the State of New Jersey by act of the Legislature of that State, which met in special session on Wednesday of last week. The act is to take effect on and after July 4 next. It is so comprehensively worded that it absolutely prohibits, for trapshooting purposes, the use of crows, sparrows or pigeons, or, in fact, any other kind of birds. Its prohibition is absolute in general and in particular. It ends pigeon shooting.

The prohibitive area is growing. The immense territory, all New England and New York, is thus still further enlarged by New Jersey's adverse act. In the West, the opposition grows also. Iowa recently prohibited the sport in question by statutory enactment. Several other States have shown open hostility or threatening disapproval of it, and it is fair to infer that other States will prohibit it.

The act of the New Jersey Legislature is specially disastrous to this sport. New Jersey's trapshooting interests, from the viewpoint of financial investment and quantity, surpass those of any other State. It was the most active section in respect to pigeon shooting. Within its boundaries are situated the houses and grounds of three famous, wealthy clubs, namely, the Riverton Gun Club, of Philadelphia, the Carteret Gun Club, of New York, and the Westminster Kennel Club, the latter a recent immigrant to that State. The many thousands of dollars invested by these clubs will be lost so far as the trapshooting features are concerned.

Of the New York clubs, the Hell Gate Gun Club, the Emerald Gun Club, the New York German Gun Club, and others, with an exceedingly large membership in the aggregate, will either become inoperative or will disband.

The moral effects of this law will be still more important and far reaching, for with such an important precedent for guidance, the Legislatures of other States are encouraged to vigorous action against pigeon shooting; and, furthermore, they will find weaker opposition to prohibitive legislation.

However, in this connection, be the loss to the sport what it may, the sport of shooting at the traps is not ruined. Its devotees have still unrestricted liberty to shoot at targets, which, after all, is no mean test of skill, although it will never hold so high a place as pigeon shooting in the esteem of the relatively small class which devotes itself to that form exclusively.

In any case, when pigeon shooting is prohibited by law in any section, it is incumbent on all good citizens to obey the law and the laws.

### NEW JERSEY BEACH BIRDS.

THE actions of the Legislatures of New York and New Jersey during the session now ending, present a strong contrast. In New York, after a hard battle, the bill providing for the repeal of the anti-spring wild fowl shooting bill was defeated, while New Jersey formally enacted that shore birds or bay snipe may be shot from the 1st of May to the 31st day of December. In other words, may be shot throughout the breeding season and during the whole time that they are with us. All protection is withdrawn from this group of birds.

This action is extraordinary and regrettable. It is opposed to the sentiment with regard to game protection of the country at large, and we believe to the sentiment of the great majority of the sportsmen of the State of New Jersey. It is a step backward so remarkable as to call for sharp comment by the residents of the State.

The beach birds reach us from the south about the first of May, and, after tarrying for a short time, the most of them pass on northward, though a few species remain and breed with us. For these species there is thus no protection. All during the breeding season gunners may roam abroad, shooting the birds on their nests, and in-

cidentally shooting any other bird that may present itself to view. The foreign gunner, joying in his half holiday on Saturday and the whole one of Sunday, and absolutely ignorant of our laws, delights to spend his time in the country with a gun and to kill everything that wears feathers; and when, as is sometimes done, the head and feet and feathers of the slaughtered birds are removed, it would take an expert anatomist and osteologist to say to what species it belonged. In this new law the alien gunner of whom we hear so much complaint will find his opportunity to slay at will—a temptation and an opportunity furnished him by the State.

New Jersey has long enjoyed the bad eminence of being one of the few States which still permits the summer shooting of woodcock. The present law is on a par with that one, and, as the New Jersey statutes now read, the birds of the snipe family have very little protection. English snipe may be shot during March and April and in the autumn, bay snipe from May 1 to the end of December, and woodcock in July and in the autumn. The wild fowl are little better off; they may be shot from the 1st of September to the 30th of April, while ruffed grouse, quail, English pheasants, prairie chicken and wild turkey may be shot from the 10th day of November to the 31st day of December, except on game preserves, where the shooting may begin on the 1st day of October.

The New Jersey Legislature cannot be congratulated on its game protective work for the season of 1903-4.

### POWER BOATING.

IT is now pretty generally known that the objectionable clauses incorporated in the Grosvenor bill relating to the pleasure power boat have been stricken out, and so the owners of motor craft will not be interfered with this year by any legislation. While we are very glad the Grosvenor bill did not become effective in so far as it related to the pleasure boat, we regret that there do not exist the effective laws needed to regulate the handling of power craft. Incompetent persons will attempt to sail yachts and handle boats, and often with disastrous results. All yacht sailors should be surrounded with every possible protection for the safety of all concerned. We fear that should one or two bad collisions or explosions, accompanied with loss of life, take place within the near future, the power boat would be legislated against in a most drastic fashion. This would be unfortunate and detrimental to the sport, and we should at once have regulations on the order of what was suggested by the American Power Boat Association not long since.

There are other matters, however, which may prove a menace to the sport; the demand for small power boats the past year has been unprecedented, and in some cases the builders have been unable to fill orders. If these boats were of good design and proper construction, we would welcome their appearance, but in many instances the desirable features that make up wholesome craft are lacking. However, just so long as the purchaser is satisfied with these shoddy craft, overloaded with their vulgar brass and nickel rails and gaudy cushions, the builder will turn them out. Until the consumer demands something better the builder has no incentive to produce a real boat. The builder does not pose as a public benefactor and he has no intention of educating the buying public to higher standards. A large percentage of men who have taken up power boating are not yachtsmen, and are not familiar with yachts, nor qualified to pass upon the requirements of boats of any kind. They take up the sport because they believe it will afford some excitement and amusement. Speed is the one thing they have in mind, and instead of going to one of our reputable designers they put themselves in the hands of some builder who constructs a boat from either a model or a crude drawing of his own. This builder does not know what constitutes a combination of lightness and strength as does the scientific designer, nor does he realize what strains such a boat has to meet. The result is, the powerful engines rack the boat to such an extent that it is next to impossible to keep her from leaking. One season will be sufficient to demonstrate how useless are many of the craft now being built; they will prove themselves not only unseaworthy, but slow, owing mainly to faulty design.

# THE SPORTSMAN TOURIST

## Trails of the Pathfinders.

### VI.—Alexander Mackenzie.

#### Across the Continent.

On October 10, 1792, Alexander Mackenzie left Fort Chipewyan to proceed up Peace River, his purpose being to go up the stream so far as the season would permit, and, wintering wherever he must, to cross the mountains at its head, and continue westward, if possible, to the Pacific Ocean.

Peace River takes its name from the settlement of their differences at Peace Point by the Knisteneaux and Beaver Indians. "When this country was formerly invaded by the Knisteneaux they found the Beaver Indians inhabiting the land about the Portage La Loche; and the adjoining tribes were those whom they called Slaves. They drove both these tribes before them; when the latter proceeded down the river from the Lake of the Hills, in consequence of which that part of it obtained the name of the Slave River. The former proceeded up the river, and when the Knisteneaux made peace with them, this place was settled to be the boundary."

As they proceeded the weather was so cold and raw as to make travel unpleasant, but on the afternoon of October 17 they reached the falls, where there were two considerable portages, and where they found recent fires, showing that the canoes that Mackenzie had dispatched some days before were not far ahead.

On the 19th they reached what is termed the Old Establishment, an early fort, and found that the people preceding them had slept there the previous night, and had carelessly set the large house on fire. But for Mackenzie's arrival all the buildings would have been destroyed. On either side of Peace River here were extensive plains, which offered pasture to great herds of buffalo.

The next morning they reached the fort, and were received with shouts of rejoicing and volleys from the guns, by the Indians, who now expected rum and a carouse. About three hundred Indians belonged here who, though apparently Chipewyan by race, had adopted the manners and customs of their former enemies, the Crees. The contrast between the neat and decent appearance of the men and the very disagreeable looks of the women as striking. After staying here only long enough to give some advice and presents to the Indians and his instructions to Mr. Findlay, he kept on up the river. It was constantly growing colder and the ice gave some trouble, but on November 1 he reached the place where he expected to winter.

Two men had been sent forward in the spring to cut and square timber for the erection of a house, and about seventy Indians had joined them. The men had worked well, and prepared timber enough for a considerable fort, as well as a ditch in which to set up the palisades of a stockade. Experience at the Old Establishment had shown that many vegetables would grow well in this soil and climate, but this was no time to think about gardening. What was more important was the fact that the plains on either side of the river abounded in buffalo, elk, wolves, foxes and bears, while a ridge of highlands or mountains to the westward was inhabited by great numbers of deer, being called Deer Mountain.

As with all traders, Mackenzie's first business was to call the Indians together and give them some rum, tobacco and advice. They listened to the advice, drank the rum and smoked the tobacco, promising everything that he asked.

On the 22d of November—although the sidehead giving the date in the printed volume says December—the river froze up, so that the hunters had a bridge on which to cross. Game was plenty, yet, but for this means of crossing the stream they might have suffered from lack of food. It was here that the practice of medicine was forced on Mackenzie. By means of simple remedies and by close personal attention to each case he cured a number of severe ailments among the Indians.

Of one of these he says: "On my arrival here last fall, I found that one of the young Indians had lost the use of his right hand by the bursting of a gun, and that his thumb had been maimed in such a manner as to hang only by a small strip of flesh. Indeed, when he was brought to me his wound was in such an offensive state and emitted such a putrid smell that it required all the resolution I possessed to examine it. His friends had done everything in their power to relieve him; but as it consisted only in singing about him and blowing upon his hand, the wound, as may be well imagined, had got into the deplorable state in which I found it. I was rather alarmed at the difficulty of the case, but as the young man's life was in a state of hazard, I was determined to risk my surgical reputation, and accordingly took him under my care. I immediately formed a poultice of bark, stripped from

the roots of the spruce fir, which I applied to the wound, having first washed it with the juice of the bark. This proved a very painful dressing. In a few days, however, the wound was clean and the proud flesh around it destroyed. I wished very much in this state of the business to have separated the thumb from the hand, which I well knew must be effected before the cure could be performed, but he would not consent to that operation till, by the application of vitriol, the flesh by which the thumb was suspended was shrivelled almost to a thread. When I had succeeded in this object I perceived that the wound was closing rather faster than I had desired. The salve I applied on the occasion was made of the Canadian balsam, wax, and tallow dropped from a burning candle into water. In short, I was so successful that about Christmas my patient engaged in an hunting party, and brought me the tongue of an elk; nor was he finally ungrateful. When he left me I received the warmest acknowledgments, both from himself and the relations with whom he departed, for my care of him. I certainly did not spare my time or attention on the occasion, as I regularly dressed the wound three times a day during the course of a month."

Just before Christmas Mackenzie moved from his tent into his house, and now began the erection of houses for the men. Long before this the thermometer had been down far below zero, yet the men had been lying out in the cold and snow without any shelter except an open shed. "It would be considered by the inhabitants of a milder climate as a great evil to be exposed to the weather at this rigorous season of the year, but these people are inured to it, and it is necessary to describe in some measure the hardships which they undergo without a murmur, in order to convey a general notion of them."

"The men who were now with me left this place in the beginning of last May and went to the Rainy Lake in canoes, laden with packs of fur, which, from the immense length of the voyage and other occurring circumstances, is a most severe trial of patience and perseverance; there they do not remain a sufficient time for ordinary repose, when they take a load of goods in exchange, and proceed on their return, in a great measure, day and night. They had been arrived near two months, and all that time had been continually engaged in very toilsome labor, with nothing more than a common shed to protect them from the frost and snow. Such is the life which these people lead, and is continued with unremitting exertion till their strength is lost in premature old age."

Mackenzie was now receiving plenty of beaver from the Indians. But, on the other hand, he was not without the usual annoyances to which the fur trader was exposed. The Indians had a tendency to quarrel among themselves, especially over their gambling at the platter game, which is a sort of throwing of dice, the same, apparently, with the seed game, so common among all the Indians of the plains. On the whole, however, the winter passed quietly, and geese were seen on the 13th of March.

In closing his account of this winter, passed high up on Peace River, Mackenzie gives some account of the Beaver and Rock Mountain Indians living there, who, he says, did not exceed 150 men capable of bearing arms. As late as 1786, when the first traders from Canada arrived on the banks of the Peace River, the natives employed bows and snares, but since then they had become well armed, bows were little used and snares were unknown. These Indians were excellent hunters and such hard workers in the field that they were extremely lean, being always in the best of training. When a relation died the men blackened the face, cut off their hair and gashed their arms with knives and arrows. The women often cut off a finger at the death of a favorite son, husband or father. The Indians told of a time when no timber grew on the hills and plains along Peace River, but they were covered with moss, and the reindeer was the only animal. As the timber spread on them, elk and buffalo made their appearance, and the reindeer retired to the range of highlands called Deer Mountain.

The month of April passed, and early in May Mackenzie loaded six canoes with the furs and provisions he had purchased, and despatched them to Fort Chipewyan. He, however, retained six of the men, who agreed to accompany him up Peace River on his western voyage of discovery, and left his winter interpreter and another person in charge of the fort, to supply the natives with their ammunition during the summer. On the 9th day of May he embarked in a canoe twenty-five feet long, loaded with about 3,000 pounds of provisions, gifts for presents, arms, ammunition and baggage and ten persons, two of whom were hunters and interpreters.

The first day's journey was through an interesting and beautiful country. "From the place which we quitted this morning the west side of the river displayed a succession of the most beautiful scenery I had ever beheld. The ground rises at intervals to a considerable height, and stretching inwards to a considerable distance; at every interval or pause in the rise there is a very gently ascending space or lawn,

which is alternate with abrupt precipices to the summit of the whole, or, at least, as far as the eye could distinguish. This magnificent theatre of nature has all the decorations which the trees and animals of the country can afford it; groves of poplars in every shape vary the scene, and their intervals are enlivened with vast herds of elks and buffaloes, the former choosing the steeps and uplands, and the latter preferring the plains. At this time the buffaloes were attended with their young ones, who were frisking about them; and it appeared that the elks would soon exhibit the same enlivening circumstance. The whole country displayed an exuberant verdure; the trees that bear a blossom were advancing fast to that delightful appearance, and the velvet rind of their branches reflecting the oblique rays of a rising or setting sun, added a splendid gaiety to the scene, which no expressions of mine are qualified to describe. The east side of the river consists of a range high land covered with the white spruce and the soft birch, while the banks abound with the alder and the willow. The water continued to rise, and the current being proportionately strong, we made a greater use of setting poles than paddles."

On the following days camps of Beaver Indians were seen, and Mackenzie was somewhat anxious lest they should encourage his hunters to desert, but this did not take place. Game continued abundant, and on the 13th they saw along the river tracks of large bears, some of which were nine inches wide. "We saw one of their dens, or winter quarters, called watee, in an island, which was ten feet deep, five feet high and six feet wide, but we had not yet seen one of those animals. The Indians entertain great apprehension of this kind of bear which is called the grisly bear, and they never venture to attack it but in a party of at least three or four."

The land on both sides of the river was high and irregular, and the banks and the rocky cliffs exhibited strata of red, green and yellow colors. "Some parts, indeed, offer a beautiful scenery, in some degrees similar to that which we passed on the second day of our voyage, and equally enlivened with the elk and the buffalo, who were feeding in great numbers and unmolested by the hunter." The next day they passed a river, of the mouth of which Mackenzie says: "This spot would be an excellent situation for a fort or factory, as there is plenty of wood and every reason to believe that the country abounds in beaver. As for the other animals, they are in evident abundance, as in every direction the elk and the buffalo are seen in possession of the hills and the plains." Two elks were killed and a buffalo wounded that day. The land above their camp spread out in an extensive plain, gradually rising to a high ridge, chiefly grassy, and dotted with poplar and white birch trees. "The country is so crowded with animals as to have the appearance, in some places, of a stall-yard, from the state of the ground and the quantity of dung which is scattered over it. The soil is black and light. We this day saw two grisly and hideous bears."

Although the ascent of the river had not been easy and they had frequently been obliged to unload and repair their canoe, it was not until Sunday, the 19th, that they met rapids and cascades, which presented greater difficulties. The canoe was heavily laden, the current enormously swift, and broken constantly by rocks and shoals, the only means of advance was by the tow line, and the beach was often narrow or wanting. At the beginning of this very difficult stretch of water they found several islands of solid rock with but little soil upon them, the rock worn away near the water's surface, but unworn higher up, so that the islands presented, as it were, so many large tables, each of which was supported by a pedestal of a more circumscribed projection. On these islands geese were breeding.

Carrying over short distances, often crossing the river in a very swift water, in constant danger from the great stones which frequently fell from the banks above, and much of the time in the water, they pursued their way for a short distance over this very difficult passage. The work was terribly hard, and as far as they could see up the river there was no improvement of the channel. Therefore, Mackenzie sent out a party of six men to explore, and on their return that same night they reported that it was necessary to make a long carry—nine miles they said—before smooth water would be met with. The canoe was therefore unloaded, the baggage carried up to the top of the bank above the river, and then the canoe was fairly hauled up to the same height. There they camped. In two days' march from this place, carrying the load and the canoe, they again met quiet water.

The journal for Thursday, the 23d, enumerates the different sorts of trees which they saw, among which is named bois-picant, a tree which Mackenzie had not seen before, but which was apparently the west coast shrub—the devil's club, which grows in a few places on the eastern slope of the Continental Divide. Although he did not know it, Mackenzie was now quite close to the summit of the Rocky Mountains.

The river here was wide, flowing in great volume, and very swiftly but smooth. There were many ani-

imals in the country, for their tracks were seen everywhere; and when Mackenzie left a bundle of presents on a pole, as a good-will offering to any natives who might pass by, one of his Indians added to the bundle a small, round piece of green wood, chewed at one end to form a brush, such as the Indians use to pick out the marrow from bones. This was the sign of a country with many animals in it. At a number of points along the river they had found places where wood had been chopped with axes, showing that the Indians who had passed along here had had intercourse with the whites.

They were now flanked on both sides by high mountains covered with snow, and the cold was so severe that the men, although working hard, could not get along without their blanket coats. On the last day of May the men were so cold that they landed in order to kindle a fire.

Their great labor, so long continued, had made Mackenzie's people more or less discontented. They were tired of the journey and anxious to get back. Moreover, some wanted to go in one direction and some in another, and the forking of the river gave rise to open grumbling. However, Mackenzie handled them well, and they went on. On the 1st of June he says: "In no part of the Northwest did I see so much beaver-work within an equal distance as in the course of this day. In some places they had cut down several acres of large poplars; and we saw also a great number of these active and sagacious animals. The time which these wonderful creatures allot for their labors, whether in erecting their curious habitations or providing food, is the whole of the interval between the setting and the rising sun."

Ever since they had started the water in the river had been rising, since, of course, the advancing summer was melting the snows in the neighboring mountains and swelling all the streams. On the 5th of June Mackenzie left the canoe and ascending a high hill or mountain crossed the country, and climbing a tree looked ahead. He saw little that was interesting, and on returning to the river could see nothing of the canoe. Made anxious by this, he went forward to see if it was ahead, sending others of his people back to look for it. He had no food, and was preparing to lie out during the night when a shot from Mr. Mackay and the Indian who had been sent back announced that the canoe had been discovered. His people excused their slow progress by saying that their canoe had been damaged and that the travel had been harder than on any previous day, and Mackenzie pretended to believe them. The difficulties of the way were now very great. The current was so strong that paddles could not be used, so deep that the poles were useless, while the bank of the river was so lined with willows and other trees that it was impossible to pass the line. The water was still rising and the current growing stronger. In spite of all these impediments they pushed on, and were already beginning to look for the carrying place, where they should cross the mountains to the stream which ran toward the Pacific.

On Sunday, June 9, they noticed a smell of fire, and in a short time heard people in the timber, as if in a state of confusion. The Indians were frightened by the discovery of the explorer's party, and the explorer's party were not a little alarmed for fear they should be attacked. Very judiciously Mackenzie turned his canoe off to the opposite side of the river, and before they were half way across two men appeared on the rising ground opposite them, brandishing their spears, displaying bows and arrows and shouting. The interpreter called to the Indians, telling them that the white people were friendly, yet the Indians preserved a threatening attitude, but after some talk consented to the landing of the party, though evidently very much frightened. They laid aside their weapons, and when Mackenzie stepped forward and shook hands with each of them, one of them, trembling with fear, drew his knife from his sleeve and offered it to Mackenzie as a mark of submission.

These Indians had heard of white men before, but had never seen any, and were extremely curious as well as suspicious. They had but just reached here and had not yet made their camp, but on the discovery of Mackenzie's party, had run away, leaving their property behind.

The explorer made a great effort to conciliate and to attach them to him, and during the day the whole party of Indians came in, three men, three women and seven or eight boys and girls. They were delighted with the beads which were given them, and seemed to enjoy the pemmican, their own provision consisting entirely of dried fish. They possessed some iron, which they said they obtained from people distant about eleven days' march, and that those people traveled for a month to reach the country of other tribes, who lived in houses and who extended their journeys to the Stinking Lake, or the ocean, where they traded with white people, who came in boats as large as islands.

This account discouraged Mackenzie, who feared that the end of his journey was far distant. However, he continued his efforts to lull the suspicions of the Indians, and treated them and their children with especial kindness. The next day, sitting about the fire and listening to the talk of the Indians and interpreters, some portion of which he could understand, he recognized that one of the Indians spoke of a great river flowing near the source of the one which they were ascending, and of portages leading to a small river, which discharged itself into the great river; and a little patient work led the Indian to describe what seemed a practicable route toward the ocean.

These Indians were of low stature, not exceeding five feet six or seven inches, lean, round-faced, with pierced noses and loose hanging hair. They wore robes of the skins of the beaver, the ground hog or the reindeer, dressed with the hair on. Their leggings and moccasins were of dressed moose, elk or reindeer skin. The men wore collars of grizzly bear claws. Their cedar bows were six feet in length, and bore a short iron spike on one end, and so might be used as a spear or lance. They also carried lances, headed with iron or bone. Their knives and axes were of iron.

They made lines of rawhide, which were fine and strong, while their nets and fishing lines were of willow bark and nettles. Their hooks were of bone set in wood, their kettles of basketry, their spoons of horn or wood. Their canoes were made of spruce bark. Among certain presents given Mackenzie before he parted from these people were a net made of nettles and "A white horn in the shape of a spoon, which resembles the horn of the buffalo of the Coppermine River"—by which undoubtedly is meant the muskox, "but their description of the animal to which it belonged does not answer to that." This horn was probably that of a mountain sheep.

With a guide engaged from these people Mackenzie pushed on, promising the Indians that he would return in two months. The journey up the river was difficult, and the canoe by this time was in bad shape, so that a little jar caused it to leak, and repairs were frequent. At length they left the main stream, by the instruction of the guide, who declared that it began only a short distance away, having its origin in a great valley which was full of snow, the melting of which supplied the river. The branch which they went was only about ten yards broad and the one they entered still narrower. The current was slow, and the channel so crooked that it was sometimes difficult to work the canoe. Soon they entered a small lake choked with driftwood, and camped at an old Indian camp. Beaver were abundant here, as were swans and geese, but they killed none of them, for fear of alarming any natives by the discharge of firearms. This Mackenzie regarded as the highest source of the Peace River.

At the head of the lake they found a carry where there was a beaten path, about 800 yards long, to another small lake. From here two streams were seen tumbling down the rocks from the right and emptying into the lake that they had left, while two others, falling from the opposite side, poured into the lake they were approaching. Now they had crossed the Continental Divide, and instead of fighting with the current they would be going down the stream. We may imagine something of what Mackenzie's feelings must have been when he had surmounted the Divide and saw before him a direct passage to the western ocean. But his troubles were by no means over.

From the lake they passed into a small river, full of wood which had slipped down the mountain side, and which constantly obstructed the way. At first there was scarcely water enough to float the canoe, but the water grew deeper, and toward evening they entered another lake. Its outlet was very swift, and they had difficulty in keeping the canoe from being driven against the trees which had fallen across it.

Men sent ahead down the river to report on its practicability came back with terrible stories of rapids, fallen trees and large stones. The guide was now very uncomfortable, and wished to return, but this, of course, was not permitted.

After carrying around the nearest obstacles they pushed off again, but the force of the current was so great as to drive the canoe sideways down the river again and break her. Mackenzie and the men jumped overboard, but before they could straighten her course or stop her they came to deeper water, and were obliged to re-embark, one man being left behind in the river. Almost immediately they drove against a rock, which shattered the stern of the canoe, and now the vessel darted to the other side of the river and the bow was smashed as well as the stern. The foreman tried to check her by holding to branches of a tree, but was pulled out of the canoe and ashore. A moment later she struck rocks, which broke several large holes in the bottom, and in a moment everyone was overboard trying to hold up the wreck. The strength of the current, however, forced them down the stream several hundred yards, but at last the vessel was guided into shallow water, and an eddy, and there stopped and dragged to shore. In a short time the man that they had left behind joined them, and they were now able to see what their condition was. They had lost some of their baggage and the whole of their stock of balls, but they still had some lead in the form of shot, from which bullets might be made. The men were frightened and anxious to get back, but a liberal dose of rum with a hearty meal and some encouraging words from their leader quieted their fears, and made them willing to go on. Men were sent off to look for bark with which to repair the canoe and also to look for the main river, which their guide told them was not far distant. These men came back with unsatisfactory reports, declaring that the river they were following was quite impracticable, while they had not been able to see the other larger river.

The next day the canoe having, been repaired, was lightened and a part of the men took her slowly down the river, while the remainder carried the baggage along the shore. It was evident that this stream could not be followed much further, and again exploring parties were sent out to see if the great river could not be found. They saw it, but declared that to reach it would be very difficult. That night Mackenzie, as usual, sat up to watch the guide, so that he should not desert, but Mr. Mackay, who relieved him, permitted the man to slip away, and he was not seen again. The river that they were descending became more and more swift and rough and was, in fact, wholly impracticable. It was now determined to cut a way for the canoe across a neck of the land, and at eight o'clock that night they had the inexpressible satisfaction of finding themselves "on the bank of a navigable river on the western side of the first great range of mountains."

Rain the next morning postponed their start until eight o'clock, when they were on the water and, driven by a strong current, which, though it carried them along swiftly, was perfectly safe, since the river seemed deep. The stream was constantly joined by other rivers, and after a time it broadened out and the current became slow, so that they proceeded with more deliberation. An Indian cabin of recent construction was seen on the shore, and toward night a smoke on the bank indicated natives.

## Fly-Fishing for the Fair.

From Recollections of Sport with a Companion.

THE best rod for a lady is a split-bamboo of the best quality, nine feet long, weighing four and a half to five ounces; a small click reel, holding 30 yards of fine enamelled waterproof line, six foot leaders or casting lines of silk worm gut, a good assortment of flies, selected with reference to the water to be fished, and a dozen snelled bait hooks of medium size. In stream fishing, the great difficulty has been due to the necessity of wading the stream, if the best sport is to be secured. A short, light skirt can be worn over waders, but after the spring sun has warmed the water, it is quite unnecessary to carry cumbersome waterproof wading gear. One of my girl friends wore stout shoes with hob-nails, heavy woolen stockings, with leggings, short skirt, jacket with roomy pockets, etc. If you are wise select a stiff, light hat that can be depended upon to stay where it is put.

Lake fishing is very delightful, but girls with sporting blood in their veins enjoy far more the independence and freedom found in wading and fishing one of our big mountain streams, where the scene is constantly changing and every variety of water is found; the long, deep, placid pool, flecked with foam, with heavy rapid pouring in at the upper end; the stretches of quick water and rifts of greater or less depth, and the potholes among the big rocks, where the stream is a running torrent. A girl, not greatly above the average in health and strength, has begun a day dedicated to sport by breakfasting at 6 o'clock in the morning; then a tramp of four miles over the trail to reach a good and wild part of the river, where it has not been over-fished. On entering the water it feels a trifle cold, but this passes off quickly, and she has fished two miles up the stream without thinking of a chill; in fact, without thought of anything except the beautiful surroundings and trout, nearly a dozen of which lie in her creel. She would never think of lunch if we did not remind her of it. Then indeed she finds her appetite, and keenly enjoys the sandwiches while resting luxuriously upon a bed of warm sand. She is quite ready to begin again, and we retrace our steps, picking up a trout here and there, and talking of the chances of getting a real big one in the great pool far down the river, which we have decided upon for the late evening cast.

The sun sinks behind the hills, great shadows stretch across the narrow valley; yet the light is still too strong on the favorite pool. Oh, we must wait a little longer. Now the sun has gone, the shadows deepen and the trout are rising here and there in a business like manner. She has taken a good fish, another, and another. Oh, just one more! The last trout is in the basket and we creep through the bushes looking for the trail. It is almost dark, but instinctively we know that the path is underfoot. We tramp onward in Indian file, and for a time chat brightly of the day's sport; but it grows very dark under the trees, and all our attention is concentrated on the trail. Finally, we reach the wood road, where we can walk side by side; the underbrush and forest are close on either hand. Suddenly there is a crash—close, very close. She grasps my arm for a moment, then laughs. What is it? We do not know. It may have been a timid bear, a lynx, or a stupid porcupine. We think that a belated squirrel, a rabbit or a long-eared wood mouse could never have made so much noise. We like to imagine that it was some savage beast, though we know that there are none here. She is not afraid. Afraid? Puff! No, indeed. Shall we take the short cut? It will save nearly half an hour; but she will have to wade the stream where it is wide and deep, in the darkness. No matter; she is afraid of nothing now. We pass through a belt of pine (since sold for a large sum and fed to a hungry saw mill—pine is very valuable nowadays), then through fields and brush to the water. It looks black and sullen, but she takes my arm, and in we go. Soon we are over, and refreshed and dripping, seek the well-worn path.

A few minutes' walk and the lights of the hotel shine before us. We enter, and in a moment are surrounded by an eager crowd. How very cool and clean these people are. The cry is: "What luck? What luck? How many trout have you caught?" A great dish is brought forth and the fish are heaped upon it. Twenty-nine. "Good! You have had fine sport for the month of August." "What time is it?" "Eight o'clock. Are you tired? Going to bed soon?" "No, indeed; I am going to the dance; but we will have supper first."

She comes down in a few minutes transformed, radiantly bright. She feels no fatigue now. In fact, will not realize how tired she is until she goes to bed. It is a healthy tired, and no ill results. Not even when on one occasion, in her eagerness to hook a rising trout, she wades too deep, loses her footing and is submerged. No one ever caught cold when catching trout. This is true; but one must not allow the blood to stagnate by lying about. The exercise and excitement make the circulation excellent, and the sport makes for health only. Many of our women and girls love all that pertains to fly-fishing, and there is no reason why they should not enjoy it just as their fathers and brothers do.

I intend to tell about the girl and the six-pounder, but my notes are already too lengthy.

THEODORE GORDON.

Mrs. Simple Newleywed—"I want you to send around a gallon of midnight oil."

Grocer—"Midnight oil? Never heard of it."

Mrs. Simple Newleywed—"Why, I'm sure that's the kind my husband's mother said he always burned."—*Brooklyn Life.*

## Natural History.

### Pine Grosbeaks as Pets.

EAST MONTPELIER, Vt., March 28.—*Editor Forest and Stream.*—I have been interested reading the accounts in FOREST AND STREAM, by your many correspondents of the ways of feeding the starving birds this cold, hard winter. One of the coldest days a bird flew, or dropped, into our yard, and could not rise again. We picked it up, took it into the house and put it in a moderately warm room. In a short time it regained strength enough to stand. We put it into a cage, thinking to release it as soon as the weather would permit. The next day and the next were still cold and windy. In the meantime, we began to get interested in our find. By the third day she was so tame she would light on our hand and eat seeds without the least signs of fear. We thought, perhaps, it might be an escaped cage bird. This thought banished all idea of giving her her liberty in the continued cold weather.

She soon was a great pet in the family, and we began to cast about to learn, if possible, to what variety she belonged. In my inquiry I heard of a flock that answered to her description in an orchard eating frozen apples in a neighboring town.

I looked them up and found them the same as our bird, the males being red.

I tried to trap a male for two days without success. Left my trap with a friend and the next day got a telephone dispatch that he had one. We have them now in a large cage about four feet long. The male bird by the third day was as tame as the female. So we think they are natural pets. Now, I come to what I started in to ask without this long preamble: I will give description as to color, etc., asking you or some of your correspondents to give the variety to which they belong: In color the male is brick or blood red on top of head, shading lighter down the neck and breast to legs; also some red at base of tail; wings and tail brown, with white edgings on secondaries of wings, flights nearly or quite solid brown. Female is a soft shade of color, much like a maltese cat. Has a slight tinge of bronze on head, and on cushion at base of tail. They have the short, strong beak for shucking seeds. For food they are fond of apples and most all seeds, particularly so of sunflower seeds. They are about the size of robin redbreast, perhaps a bit smaller. The male has a low whistle, which he keeps going most of the time. When cleaning their cage we can hardly keep them off our hands, they are so tame. Altogether, they are enjoyable, handsome pets.

GEO. DAVIS.

[The birds are pine grosbeaks (*Pinicola enucleator canadensis*), a northern species of the old and new worlds, found in temperate climes only in winter, easily tamed and making most attractive pets. In the winter of 1903-4 pine grosbeaks appeared on Long Island, where they are very seldom seen, and a number were captured with a landing net and kept alive.]

As bearing on this subject, we reproduce parts of two contributions printed more than twenty years ago in the FOREST AND STREAM, one from the pen of our old correspondent, Shadow, and the other from B. Horsford, both writers well known for the interest of their observations and the charm of their writings, to an older generation of FOREST AND STREAM readers. Shadow says:

"Yesterday I saw three of these beautiful birds industriously picking up their dinner in a patch of weeds. They were quite tame and I drove within twenty feet of them, and paused a while to observe and admire them, as they are old friends of mine. Four years ago they were quite plenty in this vicinity, and a large flock of them came regularly every morning to feast upon some frozen apples that hung on a tree within ten feet of my window. They were very tame, and sang so sweetly that I determined to capture some of them if possible. Fixing a slipnoose upon the end of a fishpole I succeeded in roping in a pair of them; the male was a young one, and the female I judged to be two or three years old. There was an old male in the flock, gorgeous with his beautiful scarlet plumage, that I tried very hard to capture; but he was too wary for me. I got the noose over his head several times, but he would twist out of it with scarcely an effort, and never move from his perch nor cease his cheerful song. He always appeared glad to see me, and to be quite interested in my experiments; he would nod and wink at me in the most knowing manner in the world, but in spite of my best efforts, he preserved his liberty, and after a few days I saw him no more.

"The pair that I had captured I placed in a large breeding cage that was about three feet square. They did not appear to be at all alarmed, but took kindly to their new home and at once commenced eating, and in less than an hour they were twittering and singing, happy and contented. For many weeks they appeared to thoroughly enjoy themselves, and became so tame that when I let them out in the room they would fearlessly alight upon my head or shoulder and feed from my hand. I never saw such beautiful feathered pets; they kept almost a constant song from an early dawn until everyone in the house had retired for the night. Their song was not loud, but very sweet and musical."

Mr. Horsford wrote somewhat later of this species:

"I well remember the first I ever saw. It was north of latitude 45 degrees, in Maine, in the winter of '35-6. Coming home to dinner one day, in a blizzard such as is known only in that climate, I could not reach the door on account of snow-drifts. I went back to the woodshed, from which flew out five birds I had never before seen. One dropped a moment in the snow on the roof a few feet from me, and then all disappeared, uttering a soft, sweet note, to avoid separation in the blinding storm.

"Twenty years I looked in vain for that bird, whose form, color, and strange habits had been stamped on my brain. At length, in mid-winter, in Springfield, Mass., I recognized my birds of the storm. They were feeding on seeds of the ash, and I shot a pair with more satisfaction than I ever felt under similar circumstances. Six years

afterward the birds again appeared in Springfield, a flock of a dozen or so feeding on the berries of the mountain ash, seeds of black ash, and buds of Norway spruce. Observing their quiet, unsuspicious habits, I captured with noose and fishing rod five, three males. Placing them in a large cage, I sat down to make their intimate acquaintance. They had evidently come from a region where men are not known, and consequently were ignorant of human treachery and human invention. It mattered little to them that they were in confinement; like the little redpoll, they would drop in a clump on the bottom of the cage, uttering, while eating, sweetest notes of recognition ever uttered by a bird. Then the leader's note would be heard, plain as a human voice, 'Come, come, let us go,' then, like the redpoll they would all start at the same instant in the same direction. Reaching the side of the cage, they would cling for a moment to the wires, and then fall back to the perches, sitting for a few minutes silent and dejected, then running to feed and pick about the cage. This was often repeated the first day, but soon abandoned entirely.

"In a few days my birds began to warble a song of soft notes, louder and more constant. As spring advanced the song resembled somewhat that of the purple finch, but with long, sweeping notes which that bird does not utter. I used to sit hours by the cage, for I never possessed pets I so much loved. They would eat from my hand, pick and apple seed from my lips, interspersing the same sweet music.

My birds delighted to wash, a luxury denied them in their native region. I filled their bathing vessels with snow and water, in which they would wallow until completely drenched, eating snow and ice while so doing. Sitting by the cage one Sunday afternoon, the sun shining brightly, I had placed in it a ball of snow; the birds were sitting on the ball, spreading wings and feathers over it with every token of delight. Suddenly with a scream every bird showed the most intense excitement, not terror, but fight all over, heads in one direction depressed, wings slightly spread, topknot overhanging the beak, and the beak wide open. Turning my head there was a shrike hanging to the sash not a foot away. The robber bird darted off and my pets became quiet. The shrike had discovered the birds from a tree opposite the window, and the birds recognized their mortal enemy at sight, showing no inclination to retreat. My inference was that the shrike dared not encounter the old birds, a single nip of whose powerful beak would cut off the neck of the shrike in an instant.

"Wishing another test of their sagacity, I brought to the cage some stuffed birds. They approached them fearlessly, recognizing their own kind, but the instant a stuffed shrike appeared there was the same scream, the same position of desperate resistance repeated.

"One of my birds, consigned to friends in New York, lived six years in a cage, suffering lately from those shelly excrescences mentioned by Dr. Coues. My own lived about the same number of years, and at last died of plethora from over kindness. Of their southern breeding limits little is known. Finding them in summer on Moosilank, midway in New Hampshire, and having most positive evidence that they come down from the spruce belt on the Green Mountains to feed on currants and cherries in the back settlements of Vermont, I do not hesitate to presume that they may be found much further south than represented to be the case. One fact at least favors this opinion, the bird is almost an annual visitor to us, and has already arrived this first of November, the snow-bunting having come a few weeks sooner, both preceding the cold weather as never before."

### Pearl Fisheries of Ceylon.

THE most famous and best known pearl fisheries of the world are those of Ceylon, and from the earliest times pearls in great numbers and of great value have been taken from its waters. The divers descend to a depth of six or eight fathoms, forty or fifty times a day, aided in sinking by a stone fastened to a rope long enough to reach the bottom and carrying a basket or bag in which the pearl oysters are placed as collected. The greatest depth to which these divers descend is about thirteen fathoms.

The Ceylon pearl fisheries are now under the control of the British Government. A remarkable feature about them has always been their uncertainty and intermittent character. For fifty years, during the nineteenth century, the banks produced nothing, and from 1837 to 1854, and again from 1864 to 1873, no pearls were collected.

In view of the immense importance and value of these fisheries, an effort was recently made by the Colonial officers of the British Government to investigate the causes of these barren years, and also to find a remedy for them; and Prof. W. A. Herdman was asked to examine the records on this subject and to report on them. Following his report came a request by the government that he should make a personal investigation of the pearl banks, and with Mr. Hornell, an assistant, he went to Ceylon and set about the work.

The first step in the investigation was to make a complete survey of the whole sea bottom of the area of the pearl fisheries. This was done partly by sounding and dredging, and partly by the aid of divers, Mr. Hornell himself doing some investigating in a diving suit. Thus was gained much information as to the nature of the ground best suited to the growth of the pearl oyster and of the dangers to which the animal is exposed. It has many active enemies, such as sponges and molluscs and star fishes, which bore through the shell; fishes and internal parasites. Yet, on the whole, the destruction caused by these agents is slight, compared with that caused by shifting sands, which overwhelm whole beds of oysters, burying and killing them. A bed of oysters, examined in March, which extended over an area of sixteen square miles, was covered by a vast multitude of young oysters "so closely packed that the bank must have held not less than one hundred thousand million." In November of the same year the spot was revisited and the oysters had disappeared, having been buried in the sand or swept down a steep slope outside the bed.

Overcrowding is another fruitful cause of destruction which Prof. Herdman suggests may be avoided by transplanting. That the star fishes cause much damage is

shown by an example given of a crop of oysters estimated in March, 1902, as five and three-quarter millions, which had nearly disappeared by March, 1903, from this cause.

Along with the study of the oyster and the oyster beds, were carried on investigations in a number of collateral subjects. Much light is thrown on the formation of pearls, and the investigators found that only in very rare cases is the nucleus of the pearl a grain of sand. Boring sponges and burrowing worms lead to the formation of pearls or pearly excrescences on the inside of the shell by the irritation which they cause. The largest and best pearls are those which occur in the mantle "or in the thick white lateral part of the stomach and liver, or even secondarily free in a cavity of the body." These are caused by the secretion of concentric layers of nacre about the dead body of a parasite, and such pearls attain their greatest size in oysters from three and a half to five years of age.

The work of this commission will be continued and Mr. Hornell will continue his observations as marine biologist at the Galle Laboratory, where he will undoubtedly do much for the pearl, sponge, trepang and other marine fisheries of Ceylon.

Accompanying this report are many descriptions of new forms of life, and it has a great scientific as well as commercial value.

### Michigan Ornithological Club.

THE second annual meeting of the Michigan Ornithological Club was held at Ann Arbor, Mich., April 2, in connection with the Michigan Academy of Science.

In the absence of Pres. A. B. Covert, Mr. T. J. Butler presided. The business meeting of the club was held during the morning session. The election of officers resulted as follows: President, Prof. Walter B. Barrows, Agricultural College; First Vice-President, A. H. Griffith of the Museum of Art, Detroit; Secretary, Bradshaw H. Swales, Detroit; Treasurer and Business Manager, Chas. E. Wisner, Detroit; Editor-in-Chief of Bulletin, Alex. W. Blain, Jr., Detroit; Associates, Prof. W. B. Barrows, Lansing; J. Claire Wood, Detroit.

A large attendance was present at the afternoon session, held in the lecture room of the University of Michigan Museum. Mr. Wilfred Brotherton read a paper, "Random Notes on the Bald Eagle in Oakland County, Michigan," in which his experience with the bird were set forth. Mr. Norman A. Wood gave a very interesting paper entitled, "Notes on the Avi-Fauna of Oscoda County, Michigan." A complete list of the species observed during a trip down the An Sable River in the summer of 1903 was given with interesting notes. It was in this region that the first nests, eggs and young of Kirtland's warbler were discovered by Mr. Wood in July of the same year.

Dr. Van Fossen, of Ypsilanti, presented a paper on the "Winter Birds Observed Around Ypsilanti." A list of the species found was given with full notes.

Mr. Charles C. Adams, curator of the University Museum, spoke on the "Geographical Distribution of Kirtland's Warbler," and illustrated by the use of maps the migration route of this species, as known by the captured specimens.

Mr. Alex. W. Blain, Jr., spoke on "The Future for Ornithological Work in Michigan," followed by remarks by Prof. H. L. Clark of Olivet College. Mr. Clark stated that extensive field work is especially needed to map out and understand the distribution of the birds of the State.

Mr. T. J. Butler spoke at length on the formation of a chapter of the Audubon Society in Michigan, and of its needs and aims. Mr. Butler is the secretary of the Michigan chapter and can be addressed at Detroit, Home Savings Bank Building.

Papers entitled "Bird Immigration," by J. Claire Wood; "Nesting of the Barred Owl in Michigan," by E. Arnold, and "The Birds of Michigan," by Prof. Barrows, were read. Considerable interest was shown in the meeting, and the club enters on its second year under favorable aspects. Over one hundred members are enrolled. All bird students and bird lovers of the Great Lake region are requested to write to the secretary, at 46 West Larned street, Detroit.

BRADSHAW H. SWALES, Sec'y.

DETROIT, April 15.

### What Bird is This?

AT THIS season of the year—that is to say, early spring—as one strolls through the country, his ear is apt to be saluted with the cry of a bird which is almost like the sound of a clappers in a cornfield. It will begin clap, clap, clap, or clack, clack, clack (and this is a closer representation of it), and keep up uninterruptedly for a minute or so and then cease. Though very different from the cry of the cuckoo (being, in fact, quite devoid of music, withal possessing a fine resonant note of spring), it is analogous to it in this, that it nearly always seems to come from a distance and has, for that reason, a certain air of mystery about it. A dozen times have I gone in search of the utterer of the cry, only to find when I got to the place wherever it seemed to have proceeded, that it was being uttered far off in a different direction. Once, however, I was fortunate enough to get a view of the mysterious migrant. It was only a brief one, but sufficient to show me a rather large bird, about twice the size of a thrush, and of gray plumage in general. Will FOREST AND STREAM kindly identify it for me?

F. M.

NEW YORK, April.

### Breeding Turtles and Tortoises.

UNITED STATES CONSUL CANADA writes from Vera Cruz, Mexico: A laguna known as the Paso de Colombia, and situated on the northerly end of the island of Cozumel, off the east coast of Yucatan, has recently been rented from the Mexican Government by one Señor Valerio Rivero with the intention of utilizing the waters as a breeding place for the common turtle, as well as for the tortoise variety. The lessee pays to the customs authorities at Chetumel the sum of \$100 annually for the privilege, the lease to run for ten years.

### Northern Birds in Italy.

PROF. HENRY H. GIGLIOLO, of the Royal Zoological Museum, Florence, Italy reports the occurrence last winter—1902-3—in central Italy of the great white-billed diver (*Colymbus adamsi*), two of which were captured; a female on Lake Montepulciano December 2, 1902, and a male on the 19th of the same month on Lake Trasimeno.

This winter there has been an invasion of northern Italy by the Bohemian waxwing (*Ampelis garrulus* L.), which appeared in great numbers in December and January. It is reported from Nice that more than 200 specimens, said to have come from Corsica, have been sold in the market.

The yellow-billed loon, described by Gray in 1859, is an inhabitant of Arctic America, west of Hudson Bay, and is given as a casual visitor to northern Europe and Asia. Its occurrence in Italy is, of course, very extraordinary. A good figure of it is given in "The New

and Heretofore Unfigured Species of the Birds of North America," by Daniel Giraud Elliott, two volumes, New York, 1866-1869, plate 63.

### Some Birds of the South.

IN THE proceedings of the Biological Society of Washington, last November, Mr. E. W. Nelson, the naturalist, whose investigations have covered so much territory north and south, describes a number of new forms of birds from southern Mexico. Among these are a new quail dove, long-toed grouse, owl, woodpecker, two jays, several warblers and a bluebird.

In the November Condor he has an interesting illustrated article on the Mexican cormorant, which he found breeding at Lake Chapala about Christmas time, 1902. Most of the nests were just completed, and as yet contained no eggs, but quite a number had a single egg, and in a number of cases two eggs were found. A series of

eighteen eggs were taken. A later inspection of the colony, January 5, 1903, showed it to be deserted, presumably as a result of the earlier visit.

In the proceedings of the Biological Society, just issued—March 10, 1904—Mr. Nelson prints an important paper of about twenty pages entitled: "A Revision of the North American Mainland Species of *Myiarchus*."

This group, which appears to reach its greatest development in the American tropics, including the West Indies, is known in the north only by the species *cinerascens*, which extend up the west coast to Oregon, and *crinitus*, which is found in eastern America as far north as southern Canada and New Brunswick. These birds, it is remembered, very commonly employ the shed skins of snakes as nest building material.

After some introductory matter, Mr. Nelson gives a key to the species and sub-species, which number about twenty, and subsequently describes each. The paper is largely technical, but of great interest and value.

### Lost in the Woods.—VIII.

#### A Lost Hunter.

(Continued from page 315.)

ONE morning just after there had been a fresh fall of about one inch of snow three of us started to make the Echo Lake drive. The Old Trapper and the Colonel were to take the stands, while I, with our spaniel Sport, was to make the drive. The others scattered, but Henry had arranged to go for the mail. Those of us who were hunting got one buck, which fell to the Colonel. We hung him up about three miles from camp, and over four hours after the Colonel fired his shot. The deer was weighed ten days after he was hung up, and the scales recorded 198 pounds. We were pretty well tired out by the time we reached camp, and had no desire to hunt the remainder of the day, but spent most of the time in visiting with some Indians hunting near by.

At dusk, Henry, who had gone for the mail, had not returned, and the worry which we felt developed into genuine alarm when at nine o'clock he had not returned. We had fired guns and "hollered" at intervals without result, and so the Old Trapper and myself lighted lanterns, and taking one gun started to look him up. It did not seem possible for him to have gone astray, as the woods were full of logging roads and he had the Pembine Creek and the railroad to take a compass line to in case of being lost, and by following a trail along the former he could walk right into camp. We went over the route we thought he would take to the logging camp, shooting our gun and yelling, but no answer did we receive. To one who has never had such an experience let me say it is not a pleasant situation. At such times, if he has not known it before, a person will find that he is possessed of a very vivid imagination. It seems as if there is nothing that will not be thought of. All kinds of accidents are pictured in the mind. The lost one may have shot himself. He may have been shot by some other careless hunter. His gun in the act of firing may have exploded. He may have fallen and broken an arm or a leg. A tree may have crashed down and killed him. A limb or part of a tree top may have broken off and felled him with a fatal blow. He may have fallen into a lake or be mired in some swamp. Or he may be wandering miles away, traveling as only a frantic man can when he is lost. So it is no pleasant situation to have a member of your party lost and it was in no pleasant frame of mind therefore that we hunted for our man.

After beating around the roads and choppings for quite a time we finally reached the logging camp. The cook, when awakened, said that Henry had been there and had started back to camp late in the afternoon. This was somewhat of a puzzler, and we were at a loss to know just what to do when we heard a young fellow calling to us as he stuck his head out of the door of the main shanty. "Say," says he, "are you fellows looking for that hunter?" We allowed that we were, and were very much relieved when he responded with: "Well, he's in here sound asleep." Come to find out he had started for camp and when not far from the logging shanty had shot at and supposed he had wounded a deer. It was so dark he thought he would go back and stay all night so as to be near the place in the morning, and ready good and early to look for his deer, but he never thought about our being alarmed. It was three o'clock in the morning when the Old Trapper and myself, completely beat out, crawled into our bunks.

We had a somewhat similar experience one year when hunting on the Pine River, but not with a member of our own party. Two of us, while up river and about a mile or so away from it, heard a great deal of shouting over in that direction, and finally worked over that way. We were walking along a logging road that led directly to the river when out of the brush on one side of the road burst a hunter on the run.

He was a sight to behold. His clothing was all torn, his face and hands bleeding from scratches, his hat lost and his whole person bedaubed with the black from the half burned logs he had been crawling over. When he saw us he sank to the ground completely exhausted, saying: "My God! how glad I am to see you." When he revived sufficiently to talk we found that he belonged to a party that was camped about two miles further up stream and right on the banks of the river. He had been running around an area not over a half a mile square all the morning trying to find the river, and there it was so close that by standing still the sound of the water as it rushed over some rocky rapids could be plainly heard. Once on the river bank all he had to do was to follow a well-beaten logger's trail right to his camp. The poor fellow, however, had become almost crazed, and when we led him to the river he could not for the life of him tell whether his camp was located up or down stream. We finally took him to it, and when we left he vowed that no power on earth could ever get him into the woods again.

He was simply "rattled" so completely that he could not seem to get any idea of direction from looking at the sun, and he had no use he said for his compass because he didn't know whether to go east, west, north or south in order to reach the river. He had become so excited that he would run through the woods until exhausted, and generally he would wind up at the place from which he started.

This seems to be the general experience of men lost in the woods. Instead of keeping cool and following their compass, or, if without one, a direction from the sun, they imagine the compass is wrong, they get an idea that camp is located in just such a direction, and the more they travel the worse they become, until finally they reach a half-crazed condition. It would seem as if a man with a compass could work out of any part of Wisconsin now that it is so gridironed with railroads and so completely laid open by the work of the lumbermen, and yet only last fall a well-known physician while hunting was lost, and it was only after snow disappeared that his remains were found only a few miles from the place from which he started, and from all appearances he had wandered around until he died from exhaustion and exposure.

It is a bewildering thing to get lost in the wild woods and start out two or three times from a given point, in an effort to find your bearings, only to wind up at the same starting point. It is discouraging, and one can at once see how it would put the mind of an inexperienced person in a whirl. The main thing, however, is to keep cool. The first tendency, if a compass is at hand, is to doubt it. Don't do it. Stick to the compass, no matter how much it may seem to deviate, and it will always be found to be correct.

There is an old story current about an Indian who went out to hunt and carried a compass with him for the first time. When ready to return to camp he followed the compass, only to find that he was lost. He looked at the compass and said to himself, "Compass lost, Indian lost." Then he placed the compass on a log and with a stick shattered it with one blow, and as he did so ejaculating: "Compass go to —, Indian find himself," and he did.

This may be all right for the Indian, but it won't do for the white man unless he is an experienced woodsman. A man who, when in the woods keeps his head, can take a compass line and by sticking to it can land himself among familiar landmarks. The next thing is not to be in too much of a hurry. Don't tire yourself out, but carefully husband your strength. Guard against emergencies by always seeing to it that you have some matches and a small lunch in your pockets before you start out. You may have to lie out all night, and if you do when darkness overtakes, stop, build a fire and stay by it until daylight. Don't shoot all of your ammunition away at once. If you are with a party you should have a signal for help. For instance, three shots fired as quickly as possible might mean that you wanted some one to come to you. If you gave the signal and

it was not answered then wait a little while before repeating it.

When going into a new country to hunt we have always taken the direction of the water courses and the general trend of the ridges, so that when without a compass on a cloudy day knowledge of these things helps us out when in a strange place. Any wind storms that have passed through a country have usually come from one general direction, and by noting this and the way that the timber lies, information that may be of value can often be obtained. The runways of the deer generally cross the country in a well defined direction, and by observation of this a man can still further fortify himself. Our own experience in this phase of life in the woods has not been extensive, but we have frequently known of parties hunting near us whose members have suffered severely. In one instance one man laid out one night and had his feet so badly frozen that he was crippled for life.

CAROLUS.

### In a New England Park.

#### Editor Forest and Stream:

The winter of 1903-4 will long be remembered in New England for the extreme and continued cold that prevailed, which, with the numerous storms, caused the destruction of many game birds, nearly exterminated the Bob White, and even many of the ruffed grouse, which are supposed to be able to survive the most severe weather, were unable so to do. It has been the general impression that the grouse's habit of budding would prevent individuals of this kind from suffering from want of food, but an examination of a number of these grouse that have been found dead has shown empty crops, although apple and poplar trees, the buds of which they are said to be particularly fond of were within easy reach.

We have in Springfield, within a mile and a half of the business center, 465 acres of land belonging to the city, called the Forest Park, which has not been developed in quite so artificial a manner as has been the case with many such places in other towns. Within its limits regularly breed the woodcock, Bob White and ruffed grouse, and wood duck have several years nested there. A flock of fifty or more semi-domesticated wild geese roam at their will around the park, some of which each season pair and raise their young. For a number of years ring-necked pheasants have there been raised in confinement, and every spring many of these have been let loose, some of which have remained and made their home in the park. Last winter it was noticed that these pheasants were standing the hard weather much better than the other game birds and that they did not seem to want for food. Ten years or more ago there was planted in one section of the park a half acre or more of barberries (*Berberis vulgaris*). These have grown to be shrubs three or four feet in height, with long spreading branches, which, during the colder months, are heavily laden with scarlet berries. It was observed that the pheasants were feeding upon this fruit, and during the winter eat many bushels of these berries. Following a fall of snow the conditions among the barberry bushes were similar to a barnyard in the country after a storm of this kind, where the snow had been tramped down by domestic fowls, so numerous were the foot prints of the pheasants. I mention these facts, thinking they might interest persons who are engaged in raising these birds, for this kind of barberry is easily cultivated and will not only furnish pheasants with plenty of food during the colder months, but the shrubs will give them shelter against inclement weather and their living enemies.

The presence of representatives of any of these species of birds that I have mentioned, in a public park, where they are protected in fact, as well as by law, makes a very attractive addition to what is usually found in such places. The honking of a goose, the drumming of a ruffed grouse, the whistle of a Bob White, the glimpse of a pheasant skulking in the high grass, or of a woodcock skimming over a group of alders, are sounds and sights that give pleasure to many.

ROBERT O. MORRIS.

## Do Bears Destroy Game?

JACKSON, Wyo., March 30.—*Editor Forest and Stream.*—Do bears kill game? I have been in a country for twenty years where there are plenty of bears, black, brown or silver tips. I have hunted them a great deal, having killed, and been the cause of killing, 100 in that time, and I have yet to find the first instance where a bear has killed a game animal of any kind, yet they like meat and no matter how well fed they are they will go a long ways out of their way to feed upon the carcass of any game animal killed by a hunter, and this has been the undoing of a great many bears. The hunter, by taking advantage of this weak point and setting a steel trap properly, is almost sure to get bruin, as after he has once found a carcass he will invariably return to it time and time again. It is true bears will sometimes prey upon domestic stock. In fact, I once saw, while traveling with a pack outfit upon a wagon road just after a heavy rain, where a large grizzly bear had been upon the road. His long claws had sunk deep in the moist earth, and upon investigating and following the bear's track a short distance I came to where there had been a struggle and something had been dragged away. I followed the trail for about a mile, and there at the foot of the mountain I came upon a three-year-old cow that the bear had killed and dragged away.

I think that such cases are rare, and I consider the bear one of our best game animals, and I am glad that in place of Wyoming paying a bounty upon each bear killed they are now protected for ten months of the year upon all timber reservations of the State, and I trust the time is not far distant when they will be afforded the same protection as all other game animals. I agree with Mr. Long that nearly all the stories about the bear are not written from personal observation, and believe his reputation for doing harm is greatly exaggerated. Bears are very shy, and in some cases might be able to conceal the fact that they do harm to game of any kind; but, as I said, in all my experience in hunting them, I have yet to see a single instance where I thought they had harmed any game animal; yet in this same time I have been where mountain lions, wolves, coyotes and other animals had killed hundreds of game animals.

A bear's food seems to be nearly entirely vegetable; they eat grass, weeds and roots, nuts and insects. They seem to take special delight in digging out squirrels and mice, not to get the animals, but to rob their cache of nuts or grass roots.

We are told that bears den up fat and come out in the spring poor; now the fattest bears I ever saw was in the spring, just after they came out of their dens, which, in this country, is usually in May. Their first food seems to be the young grass, just starting, but if they can get at some carcass containing fairly good meat they don't seem to care for anything else. A short time after they come out all their fat disappears. Their food up to the berry season is grass, weeds and roots, with some ants, grasshoppers and grubs as a relish; then berries and last nuts. A bear knows where every old carcass in the country is, and if you track him he will take you to one after the other, even after they are all consumed, but if he finds a good fresh carcass in dark heavy woods, he will often lay by it for days, and in some cases he will bury it completely. He holes up in November, high up in heavy timber, usually where the snow will lie till June. S. N. LEEK.

## Wild Ducks and Marsh Lands.

FORT ATKINSON, Wis., April 1.—*Editor Forest and Stream.* It has come to be generally recognized that the scarcity of wild ducks in this region, where formerly there were many thousands, is due to the draining of marshes that formerly afforded them protection and feed. There has been no general slaughter of ducks, like that of buffalo, and the introduction of smokeless powder and repeating shotguns has simply made the birds more wary, and when driven from the large lakes in this vicinity, if there are no pools or wet marshes in which they can pass the night they fly to Lake Michigan and often forget to come back.

If shotguns could be made that would shoot fine shot at all distances, from four rods to a mile, and make a 30-inch pattern at all ranges, there would be danger of wiping out the ducks, but none of us will ever see that day. However, while the ducks can not be wiped out by improving the firearms under present restrictions for hunting, they can most assuredly be driven out by draining the marshes, and this, in time, will produce the effect feared—their extinction.

The wisdom of the State in preserving wild ducks may be somewhat from poetic reasons, illustrated in the love of even non-hunters, to see these beautiful birds of passage flying northward in spring to their mysterious homes and southward again in the fall, but the main reason is to promote the sport of hunting, because a close acquaintance with the woods and fields is needed by thousands of the State's hardest workers, in order to keep them in good health.

This class is very large and takes in every man who owns or borrows a shotgun, while back of these is a large sympathetic class that would join in the sport if it could. These two classes, which include many of our foremost citizens, resent the growing tendency to drain every marsh in the State, though such draining may add a few dollars to the farm receipts for the year. Every extensive marsh drained not only encroaches upon sports afield but is a hindrance to the conservation of the water supply of the country to an extent that had been estimated at more than the cutting off of double that acreage of heavy forest.

This last is a reason that appeals at once to every citizen, sportsman or not.

One of the reasons that have caused government forest reserves to be made, has been to afford an opportunity to the poor man to enjoy the sport of hunting, which, in time, without this, would be narrowed down to the rich in protected reserves.

It is time that a general movement was made toward setting apart worthless marsh lands as game preserves.

When drained they are always subject to ruin by disastrous floods, and in a single wet season all that has been spent on them may be brought to naught. As gov-

ernment game preserves, they would be a source of perennial enjoyment to even the poorest citizen of our land.

For years past there has been a growing feeling that wild ducks would soon become extinct. A few were seen here in the spring and fall, and only a few. The old time flight was gone. Large marshes hereabouts were dry and the streams low, on account of lack of spring freshets and heavy fall rains. The rainfall remained the same, but, owing to open winters, there was no accumulation of snow and ice to flood the marshes in April.

This year all was changed. Heavy fall rains flooded the marshes. Heavy snow and twenty-four inches of ice covered land and water up to the middle of March. Floods not seen since 1881 have made room for millions of wild ducks, and the ducks are here. They are feeding on submerged cornfields, turnips and other vegetation. Old hunters at Lake Koshkonong report that the air is full of ducks and that it "is just like old times." Thousands of acres of "State lands" are nothing but swamps and marshes that would be worth ten times as much to the State withdrawn from sale and kept as game preserves as they can ever bring if sold under the hammer.

H. L. HOARD.

## A Pipe Full.

*Editor Forest and Stream:*

Perhaps one of the greatest pleasures incidental to the pursuit of game is that derived from a close observation of the wild creatures themselves in their haunts. It is, I think, a pleasure more real than the actual killing of the game, though truly that part of it is, to most of us at least, a source of keen enjoyment.

No one who has ever killed game will gainsay the delicious thrill of satisfaction and self-applause that follows the careful stalk and the successful shot. The picture of the buck lurching to fall as venison—your version, the cleanly killed quail falling like a plummet, the sudden wilting of the gaily plumaged drake or black-necked Canada goose, remains fixed in our memory, to be recalled and enjoyed again and again, long afterwards.

For, whether we have to thank a whilom savage ancestry or the fact of our being carnivores, there remains in most of us enough of blood-lust to desire to slay in season game for the sake of the game itself. Even the pleasure that we derive from studying our friends of fur and feather is not wholly free from a desire to kill. For, apart from those desiccated specimens of humanity whose sole purpose in studying anything animate is to catalogue it according to order, family genus and species, and juggle with its Latin name—is it not anticipation that makes it pleasurable to watch the wild fowl, for instance, sporting about the marshes? Anticipation of what—why, doubtless, the shoot we will have on the morrow, or the next week, or next season.

These rather rambling and incoherent remarks are the substance of a thought brought to mind a short while ago when the writer was whiling away an afternoon in the delightful occupation of tinkering with decoys and boats and other paraphernalia, and preparing for a shoot on the morrow.

I was hidden in some tules running out into the lake and forming a point on which a stand was located. There had not been a gun fired on the grounds for several days, and the birds were floating around in small rafts here and there, most of them apparently asleep, while the shores were the resting places of thousands of others basking in the warm rays of our midwinter sun. The day was ideal; a brisk breeze from the west hummed through the tules and whipped up miniature waves on the lake, and caused a sleepy lap lap of water against the rushes.

Not more than a gunshot away a flock of ten white-fronted geese floated, occasionally preening their glossy plumage and now and then dipping thirsty bills in the water, and then pointing them straight at the sky, to let the drops trickle down their trim necks. A band of shovelers, swimming along in single file, their gaudy red, white and blue contrasting sharply with the modest gray and drab of the geese, were making voluble comments on the weather, and their great peace and contentment, one occasionally pausing to tread water and flap lazy wings in the breeze. Now and then some swooping hawk would drop down and create consternation among the teal on the shore, causing them to take flight in a series of whirls and evolutions, perfect as one bird, which no hawk could follow. Far down the lake numbers of white dots bobbing about, gleaming in the sunlight, marked a raft of pintails riding in the open water.

It made a satisfying picture, and as I sat there, blowing meditative rings from my pipe, I wondered: Is this what those chaps mean who advocate hunting with a camera, and who preach a doctrine of bloodless sportsmanship? It was truly a beautiful picture—the birds, the background of sunlit, breeze-kissed water, and I was certainly very well content without a gun. But then at that very moment was not anticipation busily at work, weaving pictures from the past of what the morrow might have in store? And still wondering I walked back to the cabin to fill my shell case.

ROBERT ERSKINE ROSS.

CALIFORNIA.

PARIS, Saturday.—Spring fashions for Parisian dogs include many novelties, such as colored cambric night shirts, rubber shoes, thick, fluffy dressing gowns to wear after a bath, straw and felt hats, special wicker sofas, cushioned and bedecked with garlands and ribbons; nail files, ear picks, powder boxes and vaporizers.

At the dogs' dressmakers, in the Palais Royal, I noticed this week a white, hairy cloth overcoat bordered with white mohair galons, a red velvet collar and a pocket for the handkerchief.—New York Herald.

"This race problem is a dreadful thing." "Yes," answered young Mrs. Torkins; "whenever I see Charley get a pencil and begin to figure on the entries in a race, I know there's going to be trouble."—Washington Star.

## News from the Illinois.

THE ducks are flying north, blue-winged teal and mallard. But they do not make this State their rendezvous as in former times when blue ponds dotted the landscape and little streams wandered like silver threads through the woof of copper-colored prairie grass.

Along the rivers and lakes the wild orgies of the hardy feathered travelers are still held with all the old-time noise and chatter, but the rivulets have dried away and the ponds have been converted into good corn lands, by the aid of tilling.

Howsoever, the hunter's fret gets into the veins of a few men and boys when the wild duck's cry is heard, and buff hunting coats and brown leggings go slipping away to dredge ditches which take the place of the ponds and streams of other days, for the ducks and geese must still find a few resting places on their way to the Labrador coast.

But the game does not tarry now, as of old, a few days, a week at the most, and these doughty birds of passage have left us until the winter drives them south again.

Twenty years ago it was no uncommon thing to be able to find a dozen nests of wild goose and duck in a five minutes' walk. To-day not one duck will be found nesting in the old haunts.

Of prairie chicken and quail there are scarcely any to be found in the middle portion of the State. What a change man has wrought in a few years; time was when, as a little child, I counted daily, when the weather was cool, or during the winter months, strings of both quail and grouse hanging up on my father's back porch, ready alike to make a meal for friend or stranger. Now one must go far afield for the chickens, and be invited by a farmer to his fields at that.

Yes, the ducks are flying northward, blue-winged teal and mallard, but for sport one must pack his grip and go after them, to Newfoundland and Labrador.

Meanwhile the hunter has nothing left in the way of game, if game it may be called, save the timid rabbit and the noisy sparrow. But the coming youth clings to a gun quite as tenaciously as ever did his father, and now and then kills one of his companions by way of carelessness.

MRS. JAMES EDWIN MORRIS.

## Subsistence in the Wilderness.

*Editor Forest and Stream:*

THE lamented death of Mr. Leonidas Hubbard must cause profound sorrow to all your readers, and the statement that Mr. Hubbard was inadequately equipped and not sufficiently experienced in woodcraft should add to that sorrow. Any information regarding the natural resources to be found in an uninhabited country and the best means of utilizing them must be of very great value to all who undertake such trips, but unless we are in a position to give such information and *do so*, let us refrain from telling the public how much better we could have made the trip and how much we should enjoy doing so.

Let us rather pay an affectionate tribute to the memory of one whose writings were so entertaining, instructive and free from self-glory.

It is the experience of some persons who have traveled in the north country that a gill net is easily transported and will furnish many times its own weight of food for a long period; that fish traps can be made from willows, brush, etc.; that the inner bark of willows, alders, etc., can be twisted into lines and made into nets; but this is a slow and tedious process.

All these facts, and many others, are known to the Indians of the north country, and the fact that one of the party was an Indian would indicate that unusual conditions were encountered which overtaxed their resources.

When animal life is scarce in the north land it is very scarce indeed. In spruce timber a few squirrels can almost always be depended on. Rabbits may be plentiful for a few years and then almost entirely disappear. Caribou are constantly on the move and may be beyond reach. Ptarmigan may be found most unexpectedly when not needed and be conspicuous by their absence in time of want. Blueberries and cranberries are generally abundant, but what an unsatisfying substitute to digestive organs accustomed for generations to more nourishing food.

It would certainly be the part of wisdom for anyone venturing into the "Land of Little Sticks" to take a reasonable supply of light nutritious food and not trust entirely to the resources of the country.

E. FREY BALL.

## Trails of the Pathfinders.

MONROE, Neb., March 6.—*Editor Forest and Stream.*—I am much interested in the articles now appearing in FOREST AND STREAM, called "Trails of the Pathfinders," and shall look for the coming of FOREST AND STREAM with unusual pleasure as long as they last.

L. H. NORTH.

WASHINGTON, D. C., March 10.—I am exceedingly glad you are publishing this series of articles on early exploration in North America. The books are so rare, and the privilege of consulting them so restricted, that your publication of the most important matter must be a source of information and delight to a great many people.

C. HART MERRIAM.

KELLER, Wash., March 9.—I am reading your articles on the frontier with great pleasure. Having spent the greater part of my life on the frontier, such articles seem to become a part of my nature.

LEW WILMOT.

NEW YORK, March 21.—I take this opportunity to thank you for the pleasure and interest with which I am reading "Tales of the Pathfinders."

L. F. BROWN.

Mr. Plane (who is fond of dogs)—"Miss Waite, don't you think you ought to have an intelligent animal about the house that would protect you?"

Miss Waite—"Oh, Mr. Plane! This is so sudden."—Philadelphia Press.

## Voracious Pike.

CALLING the pike the fresh water shark is a name well applied, for he is bold and anything that comes his way is food for his maw. It is a known fact to those who have studied its habits that he will eat frogs, young ducks, musquash, in fact, anything that happens to be in front of him, not even barring his own offspring. How destructive they are in a trout or whitefish lake is well known.

One of the lakes on which I was stationed years ago was said to have been, formerly, good for whitefish, but was now almost nude of this staple food of the dwellers at the post, brought about by the increasing number of pike.

As I was likely to be in charge, for a few years at least, I set to work to destroy these marauders. The lake is only a mile and a half long by a quarter broad. It discharges into a large river by a shallow creek, but, by this creek, no doubt, many pike were added to the number at each spawning time.

The creek took my attention first, and we staked it from side to side with pickets six feet high and planted them about two inches apart.

At the back or river side of this barrier we kept some old, almost useless, nets set continuously. They were doubled so that no small sized pike could pass. This was done during the low water in August.

My next move was to employ every boy, girl and old woman about the post trolling for pike. We supplied them with the trolls and lines and paid them a cent apiece for every pike over a foot long.

During this trolling process we kept some nets of large mesh, set purposely for the bigger ones. For days and weeks there must have been landed on an average a hundred a day, and yet they came.

As most of the pay was taken out in cheap "bullseyes" at a cent apiece the real outlay in money was not considerable.

The following spring we inaugurated another system of warfare against the pests, and that was by paddling quietly around the bays and shooting them while they lay spawning and basking in the sun and shallow water.

Often three or four would be clustered together. A shot would not kill the whole, but it would stun them so we could finish them with the paddle.

One that was killed in this way measured thirty-nine inches long and weighed thirty-five pounds. A fish of this size was good eating, and therefore used at the post.

The small, slimy ones, however, were burned in numbers on a brush heap.

With such persistent and continued onslaught on our part, at the end of the first year their numbers were very noticeably decreased, and at the close of the following summer they were positively scarce, and a very welcome number of whitefish stocked our lake in their place.

I resided at that post for twelve years, and we were never in want of the finest fish for the post's consumption.

Before closing this sketch I must tell one anecdote about a pike, even if I lay myself open to be disbelieved by the reader. I am well aware that fish stories stand in bad repute and the veracity of the narrator doubted. The following is positively true and came under my notice:

Years before the foregoing part of my story happened I was stationed on the height of land north of Lake Superior, and one afternoon portaged my canoe over into a small chain of beaver lakes "hunting for signs."

It was a "still, calm day," as some high-flown writer would put it.

A feather dropped would have fallen straight to the earth.

I was paddling very quietly out into the lake from the portage when I noticed something moving very gently on the surface a few yards ahead of the canoe. Getting closer I made this out to be the fin of some fish moving sluggishly. Pushing the canoe further in advance with noiseless knife strokes of the paddle, I got close enough to see it was a pike with a whitefish half protruding from its mouth and almost dead from suffocation.

This, I thought, is a rare occurrence for a person to witness, and gently reaching out my hand I inserted my thumb and finger into the eye sockets and lifted both into the canoe.

On getting ashore at the next portage I forced open the jaws of the pike, and the whitefish dropped from them. The half that had been inside the pike's mouth was quite decomposed, while the part out in the water was comparatively fresh.

In trying to swallow this fish, which was two-thirds the pike's own length, he had distended his jaws to the utmost, but they only opened enough to reach near the back fin, and here fixing his teeth in savage fury the biter had bitten more than he could eat. He was equally unable to disgorge himself as he was incapable of swallowing, and thus by his greediness he brought on his doom.

Noticing his stomach was in a distended shape caused me to rip it open with my knife, and out tumbled the remains of a smaller whitefish, almost quite digested, which had been swallowed whole and would have measured nearly a foot long.

It was gluttony and not hunger that caused him to reach an untimely end, a moral for greedy little boys.

MARTIN HUNTER.

## Tarpon at Tampico.

Editor Forest and Stream:

The season at Tampico, Mexico, has this year been extraordinary, even for this well-known fishing ground, and your readers may be interested in the fortunes of our party of three rods during ten days' fishing in those waters, swarming with tarpon, jackfish and shark, and with myriads of smaller Gulf fish that crowd the entrance to the river and bay.

W., our veteran of five seasons here, who fishes always with the tangible result in view, pronounces the season without parallel in his experience in the number of fish hooked and landed in a given number of days.

Tampico is not ideal, either in its conveniences for living or its equipment for the fisherman. In both of these, in fact, it is decidedly lacking; the hotels are poor and the food far from appetizing, while every item of tackle must be taken with you and all repairs be made by the fisherman himself as best he may. Ruiz, the proprietor of the most available boats, provides skiffs with boatmen at \$4 Mexican (\$2 American money) per day, with a charge of \$2 for the chair, of which you thereupon become the owner.

The tarpon fishing is in the Janico River, abreast of the town, and extends to Tamos, a little village nine miles above. Below, as far as La Barra, "the bar" or entrance from the Gulf, a distance of some eight miles, the jackfish run plentifully; and sharks are to be readily taken from eight to ten feet in length. Our "savalo" or tarpon record covers seven days—Feb. 3 to 10—and shows fifty-eight fish to the three rods, the largest 6 feet 4 inches in length, with a girth of 40 inches; weight (by formula) 154.6 pounds. The others varied in weight from 70 to 125 pounds, and in length from 5 feet 4 inches to 6 feet 8 inches. These fifty-eight tarpon represented approximately a third of our "rises"—that is, of fish actually hooked—and the three rods must have had during the seven days at least 150 tarpon fairly "on." W. and the writer, fishing side by side one morning for perhaps two hours, "rose" nineteen fish during that time. W.'s method, and E.'s and my own for the first few days was to shoot the fish with a revolver after it had been brought in near enough to the boat to lift the head and shoulders out of water; but my own fancy later was to land the fish on the shore, take the hook from its mouth and return it to the water. In most cases I am confident that it survived the operation. The banks of the river are low and muddy, and the landing is far from being a pleasant process, but it gives the tarpon a chance for his life, and is, I think, to be commended in the case of a fish which is practically inedible, and in most cases a sheer waste. The natives will, it is true, accept the gift of a tarpon, but its subsequent use is more than doubtful; it has fertilizing properties, however, and may be so disposed of.

The jackfish, or "purel," is a powerful fighter, but does not leap. He is a tireless puller, however, and it is no easy matter to bring him to gaff. In appearance he is a direct contrast to the tarpon, being comparatively short and deep and of a clear orange color, varied with white and blue. He is said to be excellent eating—certainly the shark finds him a dainty morsel, as we found on opening one of his captors. The jack runs in size from 8 to 30 pounds, our largest of the fifty or more taken weighing 23 pounds.

Four sharks, taken at La Barra, where we passed two days on the fine sand beach, by hand-line from the shore, and three specimens of moonfish, the latter of an exquisite color and shading—a sort of iridescent blue—completed our creel. It was a wonderful experience in what one may call the heavier or more strenuous fishing. As an exhibition of fish power the rush of the tarpon is incomparable, and the first straight leap into the air, head up and silver body quivering in the sunlight, one of the moments of a fisherman's life. The tug of the purel is simply amazing, and the alternation of their powerful struggles with the leaping and lashing of fifteen tarpon, our heaviest day's catch, should be more than satisfactory to the seeker for exciting sport.

Our weather was as nearly perfect as may be. Only one day were we kept ashore by a norther, in the teeth of which the wise fisherman goes not forth. At such times, and in the non-fishing intervals our visit was made more than pleasant by the cordial reception and kind attention of friends, who did everything to make it long and happily remembered.

HENRY G. PICKERING.

BOSTON, April 12,

## The Opening Day.

OH, don't get up yet, boys. What time is it? 4:30, eh. Too early. Dark for two hours yet. Why don't you let up and let me sleep a while yet. You are positive pests, and I will even up with you fellows yet.

All awake now and hustling, I can tell you. Where are we going to head for? "The island for me," says George. "I'll try the log jam and the North Passage," breaks in Norman. "Well, the best remaining spot is the long level for me. Shall we meet at the old elm for lunch? We are up none too early after all, boys, and I hurriedly apologize for my growling; but it was tough to be dragged out so. I wonder if Vet will have our breakfast ready, so we won't lose any time? Did he have bait procured for us, so we won't have to wait to get it this morning? We never thought to ask him to do it. Wonder if he could have forgotten it."

"Dear old Vet. Breakfast is ready for us, boys, and so is the bait. Why do we forget that he never forgets? How it does tickle him to see us so crazy and so happy to be here."

"Don't eat so fast, boys; it is unhealthy; and you look so greedy. You are not hungry, eh? Only eating because it is ready and not quite light enough to go yet. Here is Vet again with our lunches all ready. Better come with us, Vet. You only think you are too old and rheumatic. You will forget it all with the first trout. Well, good-by. Much obliged for your trouble. Oh, yes! we'll catch 'em to-day, sure. Just right; not going to be too bright; do you think so, Vet?"

At last we are started, and it seems miles to the river. "It don't seem as if it used to take so long to get there, does it, boys? And how light it is now! It is a shame we are not there now! What time we are wasting! Here's where we part. Well, good luck to you. Don't fail to be at the old elm at noon, boys." I must hustle now, get to work, and not be outdone to-day as usual. I wonder why George always catches the most and the largest? I am sure that the level is the best spot to-day, and I must be careful. It does seem, though, as if I would never get started at it. Oh, at last! The same old spot. Look at that log. That's where George hooked his two-pounder last season, right under that spur projecting over the dark pool and alongside the little eddy. Surely there must be another there now. I am shaking so that I can hardly get ready. What am I thinking of? I am almost in open view, and how can I expect to do business with a trout and so ignore his cunning? Baited at last! Is it possible? No trout there! I would not have believed it. Well, well! Come to think of it, I was too careless. Now for the old root below. I must look out now. There! What a beauty! Another, and another! What a day! Is it possible? Past noon? What will the boys think of me? Too late to go to the old elm now. I will have to eat alone and explain to them to-night. It is too bad; but I never dreamed that it was so late. I won't stop but a minute now to eat my lunch, and then get to fishing again.

The days must be getting shorter instead of longer. Where did my lunch get so thoroughly soaked? It must have been away back there when I slipped in just as I hooked that big fellow. This doughnut is about four times its original size, I should judge.

Off again! Glorious luck—beautiful fish—splendid weather. Oh, oh, can the day be so near over? It can't be possible. Well, I can't stay another minute, if I am to get back to-night. I am a little tired after all. Didn't think it. Yes, this is me, Vet. Have the boys come back yet? What luck did they have? Is it so, Vet? Have they really beaten me again? Fifteen apiece, and George has a 1¾-pounder? I don't care much, Vet. I have had such a day.

## 100 Sportsmen's Finds.

96

Most fishing stories are supposed to be untrue, or at least greatly exaggerated, and in case the above heading may lead the unsuspecting reader to pass over the paragraph we hasten to say that although it is a fishing story, it is also an absolute fact. It appears that some time ago a member of the Ladies' Branch of the Kennel Club, residing in Jersey, sent to a local firm of jewelers four Ladies' Branch shields to be made into menu holders. The jewelers sent them to a firm of manufacturing silversmiths in London, who returned them to Jersey on the 15th of January, per London and South Western Railway. Three weeks ago a fisherman was spearing for eels near the Royal Pier at Jersey, and brought up on his spear a parcel done up in a portion of a trouser leg. On inspection he found enclosed the missing silver shields, which, as the owner's name was inscribed upon them were eventually restored to her.—London Kennel Gazette.

## Ocean Cruises and Races by Yachts Enrolled in the New York Yacht Club.

*Nos Agimur Tumidis Velis.*

A SEARCH among the records of the New York Yacht Club from its foundation in 1844 to the present time, brings to light much interesting data bearing upon this subject.

The following lists cannot fail to attract those who are interested in the sport of yachting, as their perusal will recall almost all the events in our yachting world for the past sixty years.

Some of these dates may not be quite accurate, and any corrections will be most gratefully received by the club.

As early as 1850 a yacht flying the flag rounded Cape Horn, and shortly afterward the flag was carried to English waters and the Baltic by the schooner America, the sloop Sylvie, and the steam yacht North Star.

The America's sailing at Cowes gave great impetus to the sport on both sides of the Atlantic.

North Star, the first steam yacht in the club, made a cruise to the Baltic. The incident of the Wanderer, slaver, although not pleasant to dwell upon, is unique in the history of yachting. In Edith Mr. R. B. Forbes had a vessel peculiarly adapted for shoal water, as when she grounded, the water ballast in the double bottom was pumped out and the yacht floated at once.

In 1862 the famous America came into possession of the Navy Department, and did good work on blockading duty. The schooner yachts Hope and Henrietta also served their country during the Rebellion.

In 1866 Alice, 27 tons, sailed to Cowes, being the smallest yacht up to that time to cross the ocean. This year saw also the sweepstakes race, New York to Cowes, won by Henrietta.

In 1868-70 we find the N. Y. Y. C. represented in English racing by Sappho and Dauntless.

In 1875 occurred the first yacht race for steam yachts. This race was around Long Island, and was won by Ideal.

In 1878 the steam yacht Jeannette was lost in the Arctic on a voyage of discovery.

In 1885 the first circumnavigation of the globe was made by a N. Y. Y. C. yacht—the schooner Brunhilde.

The centerboard schooner Iroquois passed through the blizzard of 1888 that wrecked so many good vessels.

The Utowana was the first auxiliary of the N. Y. Y. C. to cross the ocean. This was in 1891.

In 1897 a flag member of the club, Miss Susan De Forest Day, cruised in her steam yacht Scythian to the West Indies.

The United States Government took over many of the steam yachts of the club during the war with Spain. Among those that did good work was Gloucester.

In 1902 a squadron of thirteen N. Y. Y. C. yachts assembled at Kiel, under command of Rear-Commodore C. L. F. Robinson, N. Y. Y. C. This year also the Utowana, auxiliary, won from four rivals a prize offered by the Royal Yacht Squadron in a race under sail alone.

The steam auxiliary barque America, N. Y. Y. C., made a cruise to the Arctic, 1902, and one in 1903.

In 1893 a squadron of five N. Y. Y. C. yachts were at Kiel under command of Rear-Commodore Cornelius Vanderbilt, N. Y. Y. C.

The earliest ocean race of the club was between the Maria, sloop, and Coquette, schooner, in 1846.

Many of the America's Cup contests and other races under the rules of the club have been sailed off Sandy Hook over ocean courses.

*N. B.—The different measurement of the same vessels—tonnage and otherwise—is accounted for by the various changes in the New York Y. C. measurement rules from time to time.*

1850—BETTY BLISS—Schooner, Geo. B. Rollins, owner. Sailed from New York for San Francisco; was reported lost on west coast of South America.

1851—AMERICA—Schooner, 170 tons; Com. J. C. Stevens, owner. New York to Havre, twenty-one days.

1851—AMERICA—Schooner, 170 tons; Com. J. C. Stevens, owner. Race around Isle of Wight for Royal Yacht Squadron cup—now America's cup.

1851—AMERICA—Schooner, 170 tons; Com. J. C. Stevens, owner. TITANIA—Schooner, 100 tons; Robt. Stevenson, owner. Race from Nab Light Vessel, 20 miles to sea and return. Won by America.

1851—SYLVIE—Sloop, 105 tons; Louis Depau, owner. New York to Havre, 16 days 12 hours.

1853—SYLVIE—Sloop, 105 tons; Louis Depau, owner, against English cutters, and schooners. Race 20 miles to windward and return from Nab Light Vessel. Won by Julia, English cutter.

1853—NORTH STAR—Steam yacht, 1,857 tons; Cornelius Vanderbilt, owner. Cruise to Baltic and Mediterranean ports. First steam yacht in the N. Y. Y. C.

1855—SYLVIE—Sloop, 105 tons; H. G. Stebbins, owner. Summer. Southampton to New York, 34 days. Returned dismantled.

1857-8—WANDERER—Schooner, 238 tons; J. D. Johnson, owner. Winter. Sailed for a cruise to Havana and New Orleans. Returned to New York.

1858—WANDERER—Schooner, 238 tons; W. C. Corrie, owner. July. Sailed from Charleston for Trinidad and St. Helena. She returned to Brunswick, Ga., a slaver, November, 1858. At the meeting of the N. Y. Y. C., Feb. 3, 1859, W. C. Corrie was expelled from the club, and the Wanderer's name erased from the club list.

1858—HAZE—Schooner, 87 tons; W. H. McKicker, owner. Sum. SYLVIE—Schooner, 105 tons; W. A. Stebbins, owner. FAVORITE—Schooner, 138 tons; A. C. Kingsland, owner. WIDGEON—Schooner, 101 tons; Wm. Edgar, owner. UNDINE—Sloop, 44 tons; L. W. Jerome, owner. REBECCA—Sloop, 77 tons; J. G. Bennett, Jr., owner. MADGE—Sloop, 99 tons; R. F. Loper, owner. UNA—Sloop, 67 tons; W. B. Duncan, owner. MINNIE—Sloop, 69 tons; S. W. Thomas, owner. First ocean sweepstakes around Long Island, about 250 miles. Won by Sylvie and Minnie.

1858—EDITH—Centerboard schooner, 46.6 tons (built of iron, with water ballast in a double bottom); R. B. Forbes, owner. Provincetown to Rio de la Plata in 42 days. Mr. Forbes cruised in the tributaries of the Rio de la Plata in this yacht.

1861—HENRIETTA—Schooner, 158 tons; J. G. Bennett, Jr., owner. Loaned to U. S. Government and taken into the U. S. Revenue Marine under command of Lieut. J. G. Bennett, Jr., U. S. R. M. Attached to U. S. South Atlantic Blockading Squadron.

1862—AMERICA—Schooner, 170 tons. Captured by U. S. Navy in the St. Johns River, Fla., and attached to the South Atlantic Blockading Squadron; stationed off Charleston, S. C., and other ports. Sailed in America's Cup race of 1870, finishing fourth in order and on time allowance (15 starters), under command of Vice-Admiral David D. Porter, U. S. N. Borne on the books of the Navy Department until 1873.

1862—HOPE—Schooner, 132 tons; T. P. Ives, owner. Sold to the United States Government; attached to South Atlantic Blockading Squadron, U. S. Navy.

1865—FLEETWING—Schooner, 206 tons; Geo. A. Osgood, owner.

HENRIETTA—Schooner, 230 tons; J. G. Bennett, Jr., owner. Ocean match from Sandy Hook Lightship to Cape May Lightship and return, 212 miles. Won by Fleetwing.

1865—HENRIETTA—Schooner, 230 tons; J. G. Bennett, Jr., owner. Octo- PALMER—Schooner, 194 tons; R. F. Loper, owner. ber. Ocean match from Sandy Hook Point to and around Cape May Lightship and return, 220 miles. Won by Henrietta.

1866—VESTA—Schooner, 201 tons; Pierre Lorillard, owner. HENRIETTA—Schooner, 230 tons; J. G. Bennett, Jr., owner.

Ocean match from Sandy Hook Lightship to and around Cape May Lightship and return, 212 miles. Won by Vesta.

1866—ALICE—Sloop, 27 tons; T. G. Appleton, owner. July 12. Sailed from Boston to Cowes, I. W., Capt. Arthur H. Clark, N. Y. Y. C., in command.

1866—HENRIETTA—Schooner, 230 tons; J. G. Bennett, Jr., owner. Dec. FLEETWING—Schooner, 206 tons; Geo. A. Osgood, owner.

VESTA—Schooner, 201 tons; Pierre Lorillard, Jr., owner. Ocean match, Sandy Hook Lightship to the Needles, I. W., England, under N. Y. Y. C. rules. Won by Henrietta.

1867—ALICE—Sloop, 27 tons; T. G. Appleton, owner. Cowes to Boston.

1867—VESTA—Schooner, 201 tons; Pierre Lorillard, Jr., owner. Cowes to New York, 34 days.

1867—HENRIETTA—Schooner, 205 tons; J. G. Bennett, Jr., owner. Cowes to New York, 36 days.

1867—FLEETWING—Schooner, 206 tons; Geo. A. Osgood, owner. Cowes to New Bedford, 42 days.

1868—SAPPHO—Schooner, 274 tons; E. A. Lawrence, owner. New York to Cowes, 14 days.

1868—ALINE—Schooner, 212 tons; R. Sutton, owner. CAMBRIA—Schooner, 188 tons; James Ashbury, owner. SAPPHO—Schooner, 310 tons; Capt. Baldwin (N. Y. Y. C.), owner.

International yacht race around the Isle of Wight, England. Won by Cambria.

1868—SAPPHO—Schooner, 274 tons; E. A. Lawrence, owner. Cowes to New York, 32 days.

1869—EVA—Schooner, 81 tons; Louis L. Lorillard, owner. Feb.-Apr. To Havana and return. Winter cruise.

1869—SAPPHO—Schooner, 310 tons; W. P. Douglas, owner. New York to Queenstown, 12 days 9 hours 6 minutes. Record crossing.

1869—DAUNTLESS—Schooner, 268 tons; J. G. Bennett, owner. New York to Queenstown, 12 days, 17 hours 6 minutes.

1869—METEOR—Schooner, 203 tons; Geo. L. Lorillard, owner. New York to Cowes. Lost on Cape Bon, Africa, 1869.

1870—SAPPHO—Schooner, 310 tons; W. P. Douglas, owner. May CAMBRIA—Schooner, 188 tons; James Ashbury (Royal Harwich Y. C.), owner.

International match, first race, 60 miles to sea and return to starting mark off Isle of Wight. Won by Sappho.

1870—SAPPHO—Schooner, 310 tons; W. P. Douglas, owner. May CAMBRIA—Schooner, 188 tons; James Ashbury (R. H. Y. C.), owner.

International match, second race: Nab Light Vessel to and around Cherbourg Breakwater, 66 miles, and return. Sappho, sailover.

1870—CAMBRIA—Schooner, 188 tons; James Ashbury (R. H. Y. C.), owner. May 17. SAPPHO—Schooner, 310 tons; W. P. Douglas, owner.

International match, third race: Nab Light Vessel, 60 miles triangle. Won by Sappho.

1870—CAMBRIA—Schooner, 188 tons; James Ashbury (R. H. Y. C.), owner. Summer. DAUNTLESS—Schooner, 268 tons; J. G. Bennett, Jr., owner.

International match from Daunt's Rock, Ireland, to Sandy Hook Lightship. Won by Cambria.

1871—DAUNTLESS—Schooner, 268 tons; Com. J. G. Bennett, Jr., owner. Summer. SAPPHO—Schooner, 274 tons; Vice-Com. W. P. Douglas, owner.

WANDERER—Schooner; Louis L. Lorillard, owner. Match race on cruise with N. Y. Y. C. Squadron to Cape May. From Sandy Hook to Cape May Lightship. Won by Wanderer.

1871—ENCHANTRESS—Schooner, 253 tons; Geo. L. Lorillard, owner. New York to Gibraltar.

1871—ENCHANTRESS—Schooner, 253 tons; Geo. L. Lorillard, owner. Cowes to Newport, 34 days.

1872—RESOLUTE—Schooner, 13,755 cubical contents; A. S. Hatch, owner. June 24. TIDAL WAVE—Schooner, 8,880 cubical contents; Wm. Voorhis, owner.

MADELEINE—Schooner, 8,544 cubical contents; J. Voorhis, Jr., owner. FOAM—Schooner, 5,404 cubical contents; S. Homans, owner.

MAGIC—Schooner, 4,519 cubical contents; Franklin Osgood, owner. PEERLESS—Schooner, 2,732 cubical contents; J. R. Maxwell, owner.

Wallack cup, over an ocean course. Won by Madeleine.

1872—MADELEINE—Schooner, 175 tons; Jacob Voorhis, Jr., owner. July 25. RAMBLER—Schooner, 240 tons; J. M. Forbes, owner.

Match for Brenton's Reef challenge cup; Sandy Hook Light Vessel to and around Brenton's Reef Light Vessel, off Newport, and return, about 300 miles. Won by Rambler.

1872—RAMBLER—Schooner, 240 tons; J. M. Forbes, owner. Sept. MADELEINE—Schooner, 175 tons; Jacob Voorhis, Jr., owner.

Match for Brenton's Reef challenge cup. Course, from Brenton's Reef to and around Sandy Hook Light Vessel; about 300 miles. Won by Rambler.

1872—DREADNAUGHT—Schooner, 240 tons; A. B. Stockwell, owner. Oct. 10. PALMER—Schooner, 194 tons; R. Stuyvesant, owner.

Cape May challenge cup; Sandy Hook Light Vessel to and around Five-Fathom Bank Light Vessel and return, about 212 miles. Won by Dreadnaught.

1872—SAPPHO—Schooner, 310 tons; W. P. Douglas, owner. New York to Cowes, 18 days.

1872—DAUNTLESS—Schooner, 268 tons; J. G. Bennett, owner. New York to Cowes, 25 days.

1872—DAUNTLESS—Schooner, 268 tons; J. G. Bennett, owner. Cowes to New York, 35 days.

1873—ENCHANTRESS—Schooner, 253 tons; J. F. Loubat, owner. New York to Cowes, 22 days.

- 1873—**ENCHANTRESS**—Schooner, 276 tons; J. F. Loubat, owner. Oct. 9.
- ALARM—Schooner, 225 tons; A. C. Kingsland, owner.  
CLIO—Schooner, 67 tons; T. B. Astor, owner.  
EVA—Schooner, 77 tons; E. Bird Grubb, owner.  
ATALANTA—Schooner, 145 tons; Wm. Astor, owner.  
DREADNAUGHT—Schooner, 240 tons; A. B. Stockwell, owner.  
WIDGEON NO. 10—Schooner, 105 tons; N. Y. Pilot.  
HOPE NO. 1—Schooner, 132 tons; N. Y. Pilot.  
EDMUND BLUNT NO. 2—Schooner, 120 tons; N. Y. Pilot.  
C. H. MARSHALL NO. 3—Schooner, 85 tons; N. Y. Pilot.  
J. W. ELWELL NO. 7—Schooner, 137 tons; N. J. Pilot.  
T. S. NEGUS NO. 1—Schooner, 134 tons; N. J. Pilot.  
MARY E. FISH NO. 4—Schooner, 107 tons; N. J. Pilot.  
WALLACE BLACKFORD—Schooner smack, 80 tons; E. H. Rogers & Co., owner.  
W. H. VAN NAME—Working schooner, 180 tons; W. H. Van Name, owner.  
REINDEER—Working schooner, 140 tons; Capt. Howard, owner.  
SHARPSHOOTER—Working schooner, 120 tons; C. M. Crossman, owner.  
RACER—Working schooner, 130 tons; Eugene Howard, owner.  
Ocean regatta with classes for New York pilot boats, working schooners and fishermen, for the Bennett prizes. Owl's Head, N. Y., to and around Cape May Light Vessel and return to Sandy Hook Light Vessel. Won by Enchantress. \$1,000 purse to pilot boat T. S. Negus; \$250 purse to working schooner Wm. H. Van Name; \$250 purse to schooner smack Wallace Blackford.
- 1873—**FAUSTINE**—Schooner, 95 tons; G. P. Russell, owner. New York to Cowes, 18 days.
- 1873—**ENCHANTRESS**—Schooner, 276 tons; J. F. Loubat, owner. Oct. 14.
- DREADNAUGHT—Schooner, 240 tons; A. B. Stockwell, owner.  
Match race, Cape May challenge cup: Sandy Hook to Cape May Light Vessel and return. Sailover for Enchantress.
- 1874—**ENCHANTRESS**—Schooner, 200 tons; J. F. Loubat, owner, and three English schooners and cutters; French rules.  
International yacht race off Havre; ocean course about 45 miles. Won by Corinne, English schooner.
- 1874—**VIKING**—Schooner, 151 tons; Mahlon Sands, owner. New York to Cowes, 30 days.

1903—TUSCARORA—Steam yacht, 170ft. l.w.l.; Walter Jennings, owner. March. Cruise to the Bahamas and West India Islands.

1903—ENTERPRISE—Auxiliary, 135ft. l.w.l.; F. L. Perin, owner. March. Cruise to the Bahamas and West Indian waters.

1903—NARADA—Steam yacht, 194ft. l.w.l.; Vice-Com. Henry Walters, N. Y. Y. C., owner. March 1. Cruised South.

1903—MAY—Steam yacht, 203ft. l.w.l.; C. Ledyard Blair, owner. March 2. Sailed for a cruise in West Indian waters.

1903—LYSISTRATA—Steam yacht, 285ft. l.w.l.; J. G. Bennett, owner. Mar.-May. A cruise from Nice, France, to the West India Islands and return.

1903—CATANIA—Steam yacht, 193ft. l.w.l.; S. Barton French, owner. Apr. A cruise from England to Mediterranean ports.

1903—ARCTURUS—Auxiliary, 135ft. l.w.l.; R. Stuyvesant, owner. April 6-16. Crossed, Southampton to New York.

1903—GUNHILDA—Steam yacht, 166ft. l.w.l.; W. L. Harkness, owner. Apr.-May. A cruise in West Indian waters.

1903—NORTH STAR—Steam yacht, 219ft. l.w.l.; Rear-Com. C. Vanderbilt, N. Y. Y. C., owner. Apr.-Aug. A cruise in the Mediterranean and the Baltic, returning to New York.

1903—FAUVETTE—Steam yacht, 160ft. l.w.l.; Robt. Bacon, owner. Spring. A cruise in the West Indies.

1903—APHRODITE—Steam yacht, 260ft. l.w.l.; Oliver H. Payne, owner. May-Sept. A cruise to English and Baltic ports.

1903—UTOWANA—Auxiliary, 155ft. l.w.l.; A. V. Armour, owner. June-Oct. A cruise in European waters, New York to New York.

1903—MARGARITA—Steam yacht, 272ft. l.w.l.; J. Henry Smith, owner. July. A cruise from England to Baltic ports.

1903—MARGARITA—272ft. l.w.l.; J. H. Smith, owner. July. NORTH STAR—219ft. l.w.l.; Rear-Com. C. Vanderbilt, N. Y. Y. C., owner. NAHMA—275ft. l.w.l.; Mrs. R. Goelet, owner. UTOWANA—155ft. l.w.l.; A. V. Armour, owner. LYGIA—57ft. l.w.l.; Alfred Scheitlin, owner. N. Y. Y. C. yachts at Kiel, Germany, for the racing week, under command of Rear-Com. Cornelius Vanderbilt, N. Y. Y. C.

1903—VARUNA—Steam yacht, 260ft. l.w.l.; Eugene Higgins, owner. Oct. 25. Sailed for the Mediterranean, her sixteenth voyage across the Atlantic.

1903—SAFA-EL-BAHR—Steam yacht, 210ft. l.w.l.; F. L. Leland, owner. Nov. 17. Sailed for a cruise in the Mediterranean.

1903—VERGEMERE—Auxiliary, 120ft. l.w.l.; A. C. Bostwick, owner. Dec. 20. Sailed for a cruise to the Mediterranean via Bermuda and Madeira.

RACES OVER OCEAN COURSES OFF THE COAST OF THE UNITED STATES BY YACHTS OF THE NEW YORK YACHT CLUB.

1846—MARIA—Sloop, 154 tons; J. C. Stevens, owner. COQUETTE—Schooner, 74 tons; J. H. Perkins, owner. Twenty-five miles to sea from Sandy Hook and return. A match race. Won by Coquette.

1851—CORNELIA—Schooner, 56 tons; William Edgar, owner. MARIA—Sloop, 154 tons; J. C. Stevens, owner. AMERICA—Schooner, 170 tons; J. C. Stevens, et al., owners. Trial at sea. Twenty miles to sea and return from Sandy Hook.

1865—MAGIC—Schooner, 113 tons; W. H. McVicker, owner. JOSEPHINE—Schooner, 143 tons; Daniel Devlin, owner. Race 15 miles to windward and return from Sandy Hook. Won by Magic.

1866—L'HIRONDELLE—Schooner, 262 tons; S. Dexter Bradford, owner. VESTA—Schooner, 201 tons; Pierre Lorillard, Jr., owner. Match race, 20 miles from Sandy Hook Lightship and return. Won by L'Hirondelle.

1866—L'HIRONDELLE—Schooner, 262 tons; S. Dexter Bradford, owner. PALMER—Schooner, 194 tons; R. F. Loper, owner. Twenty miles to windward and return from Sandy Hook Lightship.

1870—DAUNTLESS—Schooner, 268 tons; J. G. Bennett, Jr., owner. Oct. CAMBRIA—Schooner, 227 tons; James Ashbury, owner. Match race, False Hook, 20 miles to sea and return. Won by Dauntless.

1870—SAPPHO—Schooner, 274 tons; W. P. Douglas, owner. Oct. CAMBRIA—Schooner, 227 tons; James Ashbury, owner. Match race, Sandy Hook L. V., 20 miles to sea and return. Sappho led to finish. Race not made in agreed time of five hours.

1871—LIVONIA—Schooner 2512 area; James Ashbury, owner. Oct. DAUNTLESS—Schooner, 2899 area; J. G. Bennett, Jr., owner. Match race from Sandy Hook L. V., 20 miles to sea and return. Won by Dauntless.

1870—SAPPHO—Schooner, 274 tons; W. P. Douglas, owner. Oct. DAUNTLESS—Schooner, 268 tons; J. G. Bennett, Jr., owner. Match race from Sandy Hook Lightship, 25 miles to sea and return. Won by Sappho.

1871—DAUNTLESS—Schooner, 7124ft. displacement; J. G. Bennett, Jr., owner. Oct. DREADNAUGHT—Schooner, 6178ft. displacement; S. Samuels, owner. Match from Sandy Hook Lightship, 20 miles to sea and return. Won by Dauntless.

1871—SAPPHO—Schooner, 7747ft. displacement; Wm. P. Douglas, owner. Oct. 28. DREADNAUGHT—Schooner, 6178ft. displacement; S. Samuels, owner. Match; from Sandy Hook Light Vessel, 20 miles to sea and return. Won by Sappho.

1875—MOHAWK—Schooner, 346 tons; W. T. Garner, owner. Oct. DAUNTLESS—Schooner, 267 tons; J. G. Bennett, owner. Match race; 20 miles from Sandy Hook Lightship to sea and return. Won by Dauntless.

1878—GRACIE—Sloop, 70ft. l.w.l.; J. R. Waller, owner. Oct. VISION—Sloop, 66ft. l.w.l.; J. J. Alexander, owner. Match race, 20 miles to sea and return from Sandy Hook Lightship. Won by Gracie.

1883—BEDOUIN—Cutter, 70ft. l.w.l.; A. Rogers, owner. Oct. GRACIE—Sloop, 70ft. l.w.l.; Flint & Earle, owners. Match race for the Bennett cup, 20 miles to sea and return from Sandy Hook. Won by Bedouin.

1883—FANNY—Sloop, 66ft. l.w.l.; Prince & Whitney, owners.  
Oct. GRACIE—Sloop, 70ft. l.w.l.; Flint & Earle, owners.  
9. Match race, 20 miles to sea and return from Sandy Hook. Won by Fanny.

#### RACES FOR THE AMERICA'S CUP SAILED OVER OCEAN COURSES OFF SANDY HOOK.

1871—COLUMBIA—Schooner; Rear-Com. Franklin Osgood, N. Y. Y. C., owner.  
Oct. 18. LIVONIA—Schooner; James Ashbury, R. H. Y. C., owner.  
From Sandy Hook Lightship, 20 miles to windward and return. Won by Columbia.

1871—SAPPHO—Schooner; W. P. Douglas, N. Y. Y. C., owner.  
Oct. 21. LIVONIA—Schooner; James Ashbury, R. H. Y. C., owner.  
From Sandy Hook Lightship, 20 miles to windward and return. Won by Sappho.

1876—MADELINE—Schooner; John S. Dickerson, N. Y. Y. C., owner.  
Aug. 12. COUNTESS OF DUFFERIN—Schooner; J. Ashbury, N. Y. Y. C., owner.  
From buoys off Sandy Hook, 20 miles to sea and return. Won by Madeline.

1881—MISCHIEF—Sloop; J. R. Busk, N. Y. Y. C., owner.  
Nov. ATALANTA—Sloop, Alex. Cuthbert, owner.  
10. From buoys off Sandy Hook, 16 miles to leeward and return. Won by Mischief.

1885—PURITAN—Sloop; J. M. Forbes, N. Y. Y. C., owner.  
Sept. GENESTA—Cutter; Sir R. Sutton, Bart, R. Y. S., owner.  
16. From Scotland Lightship, 20 miles to leeward and return. Won by Puritan.

1886—MAYFLOWER—Sloop; Gen. C. J. Paine, N. Y. Y. C., owner.  
Sept. GALATEA—Cutter, Wm. Henn, R. N. Y. C., owner.  
From Scotland Lightship, 20 miles to leeward and return. Won by Mayflower.

1887—VOLUNTEER—Sloop; Gen. C. J. Paine, N. Y. Y. C., owner.  
THISTLE—Cutter, Jas. Bell, R. C. Y. C., owner.  
From Scotland Lightship, 20 miles to windward and return. Won by Volunteer.

1893—VIGILANT—Sloop; C. Oliver Iselin, N. Y. Y. C.  
Oct. VALKYRIE II.—Cutter; The Earl of Dunraven, R. Y. S.  
7. From Sandy Hook Light Vessel, 15 miles to leeward and return.

Oct. 9. VIGILANT—Sloop; C. Oliver Iselin, N. Y. Y. C.  
VALKYRIE II.—Cutter; The Earl of Dunraven, R. Y. S.  
From Sandy Hook Light Vessel, a triangle of 10-mile sides.

Oct. 13. VIGILANT—Sloop; C. Oliver Iselin, N. Y. Y. C.  
VALKYRIE II.—Cutter; The Earl of Dunraven, R. Y. S.  
From Sandy Hook Light Vessel, 15 miles to windward and return.  
All three races won by Vigilant.

1895—DEFENDER—C. Oliver Iselin, N. Y. Y. C.  
Sept. VALKYRIE III.—The Earl of Dunraven, R. Y. S.  
7. From a mark near Seabright, N. J., 15 miles to windward and return.

Sept. 10. DEFENDER—C. Oliver Iselin, N. Y. Y. C.  
VALKYRIE III.—The Earl of Dunraven, R. Y. S.  
From Sandy Hook Lightship, a triangle of 10-mile legs.

Sept. 12. DEFENDER—C. Oliver Iselin, N. Y. Y. C.  
VALKYRIE III.—The Earl of Dunraven, R. Y. S.  
From Sandy Hook Light Vessel, 15 miles to windward and return.  
All three races won by Defender.

1899—COLUMBIA—C. Oliver Iselin, N. Y. Y. C.  
Oct. SHAMROCK I.—Sir Thomas J. Lipton, R. U. Y. C.  
16. From Sandy Hook Lightship, 15 miles to windward and return.

Oct. 17. COLUMBIA—C. Oliver Iselin, N. Y. Y. C.  
SHAMROCK I.—Sir Thomas J. Lipton, R. U. Y. C.  
From Sandy Hook Lightship, a triangle of 10-mile legs.

Oct. 20. COLUMBIA—C. Oliver Iselin, N. Y. Y. C.  
SHAMROCK I.—Sir Thomas J. Lipton, R. U. Y. C.  
From Sandy Hook Lightship, 15 miles to leeward and return.  
All three races won by Columbia.

1901—COLUMBIA—E. D. Morgan, N. Y. Y. C.  
Sept. SHAMROCK II.—Sir Thomas J. Lipton, R. U. Y. C.  
28. From Sandy Hook Light Vessel, 15 miles to windward and return.

Oct. 3. COLUMBIA—E. D. Morgan, N. Y. Y. C.  
SHAMROCK II.—Sir Thomas J. Lipton, R. U. Y. C.  
From Sandy Hook Light Vessel, a triangle 10-mile legs.

Oct. 4. COLUMBIA—E. D. Morgan, N. Y. Y. C.  
SHAMROCK II.—Sir Thomas J. Lipton, R. U. Y. C.  
From Sandy Hook Light Vessel, 15 miles to leeward and return.  
Columbia won all three races.

1903—RELIANCE—C. Oliver Iselin, N. Y. Y. C.  
Aug. SHAMROCK III.—Sir Thomas J. Lipton, Bart, R. U. Y. C.  
From a point near Sandy Hook Light Vessel, 15 miles to windward and return.

Aug. 25. RELIANCE—C. Oliver Iselin, N. Y. Y. C.  
SHAMROCK III.—Sir Thomas J. Lipton, Bart, R. U. Y. C.  
From Sandy Hook Light Vessel, a triangular course, 10-mile legs.

Sept. 3. RELIANCE—C. Oliver Iselin, N. Y. Y. C.  
SHAMROCK III.—Sir Thomas J. Lipton, Bart, R. U. Y. C.  
From Sandy Hook Light Vessel, 15 miles to windward and return.  
Reliance won all three races.

DESIGNING COMPETITION—FIRST PRIZE DESIGN—SUBMITTED BY CHARLES D. MOWER, NEW YORK CITY—PLANS OF SLOOP AND YAWL RIGS.

## Designing Competition.

### First Prize Design.

We publish herewith the design which received first prize in our recent competition for a centerboard cruising boat of 40 ft. waterline. The design was submitted by Mr. Charles D. Mower, of New York city. Mr. Mower has turned out many fine boats, but to our mind this design for a 40-footer surpasses any of his previous work. The design is admirable in every respect and a boat built from it would prove as fine an all around cruiser as could be produced.

The cabin arrangement impressed us as being most unique and practical. Mr. Mower did not attempt to crowd too much into the internal space. All the quarters are well arranged and large enough to be most livable. The separate steerage, the large after cabin, the airy saloon and galley running the full width of the boat, are features which immediately recommend themselves.

It was an open question how the yawl and the sloop rigs would work out, as in both cases the mast had to remain in the same position. The ready and practical way Mr. Mower overcame this apparent obstacle demonstrated that it was no great objection. Both his sail plans are handsome and well balanced.

The following descriptive matter accompanied Mr. Mower's design, and as it gives a good idea of what he had in mind when getting out the boat's plans we publish it:

### General Description.

Cabin.—In working out this design the chief aim has been to produce a boat on which four men could take an ordinary cruise with every comfort and convenience, but at the same time especial attention has been given to arranging the space below deck so that the owner, with perhaps a friend, could live on board for the entire season in comfortable quarters with plenty of "elbow room."

The arrangement on deck is somewhat novel, and will be spoken of later. The companion stairs, which make passage below much easier than the usual steep ladder, land in a steerage between main cabin and stateroom, and cut off from each by doors, an undeniable advantage for bad weather and general cruising work. The toilet room is on the port side, opening from the steerage, with a sliding door. This has a set wash basin and regular yacht closet. The location of the toilet room makes it accessible from either cabin or stateroom, which is an advantage at night, especially in case the after state room is given up to ladies. Besides, its convenient location as regards the stateroom and cabin, the toilet can be reached from on deck without disturbing those who are sleeping below.

On the starboard side, a large locker opens from the stairway for oilers, rubber boots, etc.

The main cabin is 9ft. 6in. long, and has the usual arrangement of transoms, berths, lockers, sideboards, and also a desk, which is almost necessary where the owner lives on board.

Space is shown for a yacht stove for late fall cruising. The double stateroom aft has full headroom over its floor space, and the cabin trunk is fitted on three sides with large square windows, insuring plenty of air and good ventilation. The stateroom aft has two extra wide berths, large clothes lockers, a bureau with large drawers and two sofas. Under the stairs is a large locker for stowing suit cases, kit bags, etc.

The galley is unusually large, as it is essential that the steward should be able to cook and prepare food without the inconvenience of cramped quarters. The forecabin is entirely apart from the galley, another desirable feature, and has ample room for three hanging pipe berths, for sailing master, steward and one hand. The advantages of the arrangement are the double stateroom aft, companionway landing in steerage, large main cabin, and ample space for working part forward.

Design.—The design is moderate in every feature, the overhangs, while long enough for appearance sake, are fine and sharp in section, and should not prove objectionable; the lateral plane is not cut away, and the long, straight keel makes a boat steady on

her helm and facilitates docking. The midship section shows a full bilge, with power enough to make the boat carry sail well at a small angle of heel. The centerboard below the cabin floor gives sufficient draft for good windward work, while the boat will handle well in shallow waters without board.

Rig.—The rig has been purposely kept small, so that the boat may be easily handled by a small crew, the sail being both low and well inboard. The yawl rig shows the same mainmast and head rig, and the same gaff as in sloop rig, the main boom being shortened and the mizzen placed to preserve the same balance.

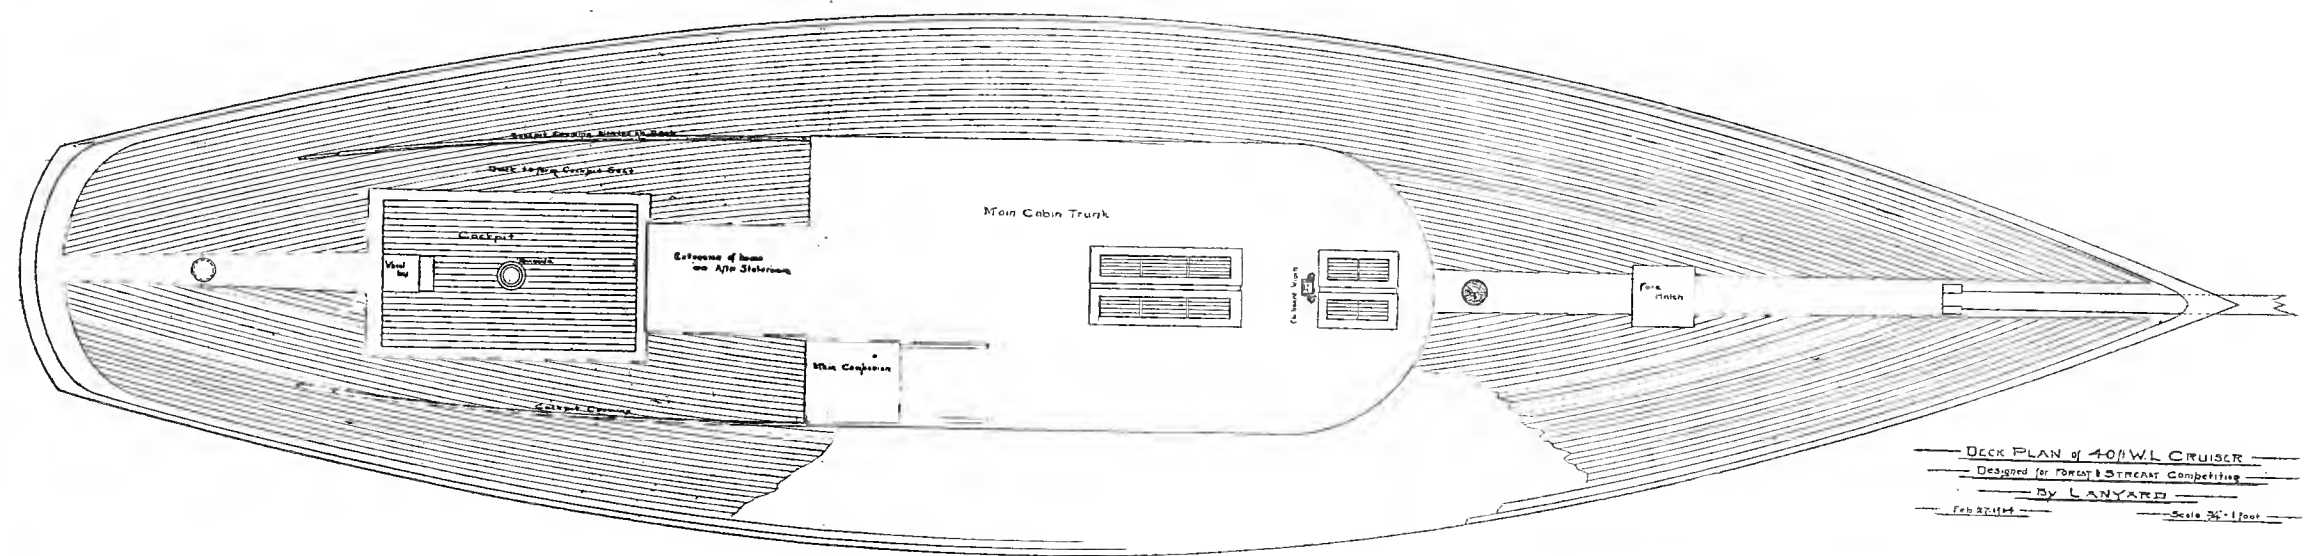

### Dimensions.

Length—	
Over all	60ft. 9 in.
Waterline	40ft.
Overhang—	
Forward	9ft. 1½ in.
Aft	11ft. 7½ in.
Beam—	
Extreme	14ft. 11 in.
Draft—	
Extreme	5ft. 11½ in.
Board down	10ft. 2 in.
Freeboard—	
Bow	4ft. 9 in.
Stern	3ft. 5 in.
Least	3ft.
Displacement	48,883 lbs.
Lead keel	18,109 lbs.
Trimming ballast (inside), about	2,000 lbs.
Area—	
Mainsail, sloop	1,380 sq. ft.
Mainsail, yawl	1,041 sq. ft.
Mizzen	250 sq. ft.
Jib	237 sq. ft.
Fore staysail	233 sq. ft.
Total—	
Sloop rig	1,850 sq. ft.
Yawl rig	1,761 sq. ft.
C.L.R. from fore end L.W.L.	23.3ft.
C.E.S. from fore end L.W.L. (sloop)	22.7ft.
C.B. from fore end L.W.L.	21.4ft.
C.Gravity, lead, from fore end L.W.L.	22.2ft.

## Gas Engines and Launches.

BY F. K. GRAIN.

(Continued from page 195.)

### Lubricators.

LUBRICATORS usually employed are for the shaft bearings, a compression grease cup. By screwing down on these grease cups the grease is forced into the bearing, or should the bearings become overheated the greases will flow naturally to the bearing. The reason that oil cups are not employed on this part of the engine is that there is always more or less and generally sufficient oil force from the crank case of the engine through the bearings resulting from the crank case compression. Again, on the other hand, should the bearings wear after a time sufficiently to allow the gas to escape through them from the crank case, it may be in a great measure stopped by forcing the grease around the bearing.

Up until quite recently the crank pin has been lubricated by putting sufficient oil into the crank case to allow the crank to dip at every revolution. This, however, has always been a very uncertain method, it being very difficult to gauge the right amount of oil to use. Should an over supply be put into the crank case, the crank will, in revolving, dash the oil up and into the gas inlet port, whence it will pass to the cylinder and cause trouble. There are two methods now in use which have proved very good, and are practically doing away with this trouble. The first method is to bore out the crank shaft from the front end through to an opening in the wrist pin, placing a grease cup on the end of the crank shaft. By this means the grease can be forced directly to the crank pin bearing. Another method is to make the connecting rod hollow, also the wrist pin passing through the piston, this opening comes in alignment with the grease cup running into the cylinder at a point which makes the two openings coincide when the engine is on the lower center.

The engine is then turned to that point before starting, the grease cup being compressed, its contents is then forced through and down into the connecting rod, and if the connecting rod is of sufficient size, one filling will suffice for a week or two.

The last, but most important lubrication, barring, of course, the small moving parts of the igniter and pump, is the cylinder. This is accomplished by means of an ordinary sight feed lubricator, which can be adjusted to feed any number of drops per minute and visible to the operator. The point in the cylinder at which the lubrication should enter is close to the top of the piston when it is on its lower center, and the piston should be of sufficient length so that this opening will always be covered. If the opening is above the top of the piston, it will get the back pressure from the cylinder and will not only be very wasteful of the lubricant but make the feeding uncertain and irregular. It is usual in all lubricators to place a small ball check on the bottom of the lubricator to prevent any back pressure from the cylinder. A small pressure tube leads up and above the oil level in order to bring the pressure, if any, above the oil. Another lubricator much in use has a large, tight fitting plunger, which is forced against the oil by means of a heavy spring; this makes an absolutely positive force feed and is an excellent method for lubricating with heavy oil when the temperature is sufficiently low to thicken the average cylinder oil.

### Mufflers.

There was a time when people objected very strongly to the noise made by the exhaust, and in order to deaden this noise a device called a muffler has been in use for a time by all the engine builders. These mufflers on a general principle consist of an enlarged chamber containing perforated disc baffle plates or pipes. The idea being to make the muffler sufficiently large to allow the exhaust gas to expand and then escape at a steady pressure through the various small openings. In the last few years the public have become more accustomed, especially since the advent of the automobile, to these noises, with the consequence that the tendency now is to do away with the muffler as much as possible. While a muffler can be designed which will make the engine perfectly noiseless, with the new design of modern short stroke engine working at high compression and high speed, it is difficult to design a muffler which will be noiseless and yet not be too expensive and so large as to take up valuable room and add weight. Again, on the other hand, we have an objection found in all mufflers, in this that they retain the heat from the exhaust gasses, and in a great many cases their proximity is very objectionable on that account, the tendency being to make all exhaust pipes as short and as large as possible with a minimum amount of muffling and get rid of the exhaust gas as quickly as possible.

### Reversing.

The reversing of marine gas engines has probably received more attention than any other part of the engine, and we are still to-day as far from the solution of this problem as we were ten years ago.

On the two-cycle engine there is one, and one method only, and this is reversing by means of the spark. To explain this we will have to take up the subject of ignition. Quite the contrary to the practice in steam engineering, the time of ignition, commonly called the lead, must take place before the engine has reached its upper center. The amount of lead necessary to get the best results of course depending upon the speed of the engine, the weight of the fly wheel and amount of compression. It is safe, however, to assume that the highest point of efficiency on the average small engine is had by igniting at a little over seven-eighths of the up stroke. The idea of igniting the mixture before it reaches the upper center, is that from the time of sparking, until the gas is ignited to its full capacity, the engine has reached its upper center and therefore gets the full benefit of expansion. Now we will suppose that the engine is turned around slowly by hand, the lead of the igniter being set as stated; in this case the engine

would kick back or reverse, and gathering force, would overcome the lead in the opposite direction and keep running on the reversed motion. We will now assume that the eccentric working the igniter is set on the dead center, in other words, true to the crank shaft; in this way the action of the spark would be the same when the engine is turned in either direction, and it will run equally well with the same power in either direction.

Now, supposing that we wish to reverse, we will throw off our switch, cutting out the electric current. This will cause the engine to slow down. When the momentum is reduced to almost the stopping point, we then thrown in the switch, and when the engine ignites against the lead as described, it will reverse and run in the opposite direction. This method of reversing is by no means infallible, and depends to a great extent upon the skill and practice of the operator, and not only this but when a boat is running at high speed, this operation can very seldom be performed, as the momentum of the boat will keep the propeller revolving and of course exerting that much additional power against the engine. This same operation is in some engines performed by means of a link motion with an insulated cut-out. The object of this being to overcome the plan of setting the eccentric off the center, in order to make the ignition directly on the center to avoid any possible back kicks in starting and, of course, under these circumstances a link motion is necessary in order to adjust the lead when the engine is reversed. This plan, although a very good talking point, adds a number of expensive parts to the engine, and really does not accomplish any better results. There are a number of clutches, gear boxes, and other devices in use, by means of which the shaft is reversed. While some of these devices accomplish the object sought for they are not considered a great success on small engines, as they are not only cumbersome but expensive and require considerable care and careful adjustment, and manufacturers in general decline to recommend them. We think we have now given a clear idea of the two-cycle engine with the exception of the sparking mechanisms, and as this part of the engine performs the same functions and is identical on both two and four-cycle, the explanation will answer for both.

[TO BE CONTINUED.]

## Yachting in Newfoundland.

NEWFOUNDLAND, although only about 317 miles in length, has a coast line of over 2,000 miles. This is explained by the fact that its whole shore line is indented with magnificent bays, anywhere from ten to ninety miles deep. For those who love smooth water sailing, and at the same time who enjoy the bracing sea air, and beautiful and ever-varying scenery, a cruise up one of those fjords leaves nothing to be desired. Take, for instance, Notre Dame Bay. It has an archipelago of hundreds of clustering islets, many of them inhabited, and containing fine harbors. The runs and passages are navigable for large steamers, and are used by cargo boats to go to at least one mining town, viz., Pilley's Island, where they load large cargoes of iron pyrites for foreign markets.

These runs between the islands furnish ideal "sailing on the summer seas." The scenery is bold and grand, and ever-changing; the water is like oil; the air in the summer months is balmy and health-giving, and for the yachting party who has a few weeks to dawdle amid pleasant scenes, no place offers greater attractions than these bays. There are over a dozen ports of call, each possessing a different attraction for the stranger. If the traveler wants rest, this is the lotus land. If he wants fishing, he is within easy reach of numbers of salmon and sea trout streams, not to mention ponds and lakes where ordinary spotted trout abound. If he is of an inquiring turn of mind, he can see one of the very best mineral belts in North America. Felt Cove Copper Mine has been working for years, and it is just as profitable to-day as ever. Felt Cove is worth a visit. It is set between cliffs. The town is built all around a small lake, which is at the bottom of the basin.

A ship must be moored at the pier nearly before a glimpse of the town can be had. A narrow tramway between the high hills leads into the foot of the lake, and when you follow that for a few yards from the pier, the pretty little town, nestling at the foot of the hills and surrounding the lake, bursts on your view. The lake looks like a diamond in its setting of highly mineralized hills. Just beyond the tramway rises, and a procession of cars comes and goes, by means of an endless chain; the full ones running down the incline from the mouth of the mine, and the empty ones being drawn to the top of the incline. The pyrites mine, at Pilley's Island is another curiosity, for anyone interested in minerals, and in fact an inspection of the mine would be an attraction for any ordinary traveler looking for experiences. Besides, the passage up through the islands to Pilley's Island is almost worth the voyage. The ship runs through a narrow strait between the islets, with the land on either hand near enough to pitch a pebble on shore. Suddenly the strait is blocked; the ship is in a veritable *cul de sac*. The ordinary observer sees nothing ahead but to dash into the land at her bows; suddenly a turn of the helm and lo! on the port or starboard hand the channel suddenly opens before you. Just ahead, perhaps, you see the top rigging of a schooner. It appears to rise from the middle of a small island; the ship rounds a point and here before him is a miniature harbor with the schooner moored nearly against the front door of a little cottage, making a picture resembling a highly fanciful Christmas card.

Little Bay is another mining settlement. Some of the best copper in America was found here. It was shipped in large quantities for years, but through some mismanagement it was shut down. It is now filled with water, and the work has been discontinued. To add to the miseries of Little Bay it was devastated by fire. It has now only a remnant of its former greatness. Yet those of its inhabitants who profess to know, say that the mine is only waiting for the right man to make it

boom better than ever, as the copper is there in sufficient quantities to repay any outlay. Hall's Bay is a very deep inlet, its wooded shores nearly within reach of the deck as the yacht sails up. In the bottom of the bay empties one of the best salmon and trout streams in the island. Then there are the South West Arm, Exploits Bay, Badger Bay and Pander Bay, all deep fjords, going for miles into the land. The Exploits and Pander Rivers are probably the best salmon streams in America, and are navigable for small craft for many miles. There are other little towns and harbors that would well repay a visit. The inhabitants are kindly and hospitable, and as yet are unspoiled by too much traffic with the outer barbarians. The same holds good of several other bays. The beauty and variety of the scenery equal if not surpass, the much vaunted charms of Norway; at least this is the verdict of travelers who have seen both. The advantages for American yachtsmen are altogether in favor of Newfoundland. The distance is not nearly so great, so that in matter of time alone, half the summer holidays might be saved by running up to one of the great Newfoundland bays. It would not take half the time to get there that it would to Norway, and the latter place does not offer a tithe of the attraction to the angler, the sportsmen or the naturalist.

If the yachtsman had a camera along, he'd get many valuable souvenirs. Apart from the scenery, he could get at Snooks' Arm pictures of whales in all stages, from the monster just harpooned to the carcass in the various stages of preparation for oil, bone, and commercial fertilizer. There are waterfalls, large enough to generate electricity sufficient to supply New York with motive power, and there are tiny cascades, just fit for picnicking. In line, if you seek rest or sport; food for the rod, gun, or kodak; if you want health or pleasure or variety, and the same time to enjoy sailing on summer seas, you cannot do better than steer your bark for Newfoundland, and make your headquarters in one of the celebrated bays of the island.

W. J. C.

## St. Paul Letter.

ST. PAUL, April 16.—Interest is increasing in the coming contest with Montreal, and the prospect for quite a number of extra boats for the preliminary trial races for this event is very bright. It is hoped that there will be five or six contestants for the White Bear trial, and probably nearly as many more for the trial to be held at Oshkosh. The committee appointed for the choosing, building and management of the challengers has decided to build a fourth boat. This boat is to be a sharp-nosed scow about 38ft. over all and of good breadth. She will be designed by Dr. J. M. Welch, who is an old member of the White Bear Y. C., and will probably be sailed in the preliminary trial races by her designer. She will be built by the Dingle Boat Co., in West St. Paul, under the supervision of Dr. Welch. Mr. Dingle was one of the first men who designed and built boats for White Bear, but for the last five years has given his attention entirely to power boats. The racing committee is seriously considering building a fifth boat from Messrs. Burgess and Packard's plans. This boat will have lots of beam and will not be very long over all.

There is to be a boat from Lake Minnetonka in the Seawanhaka cup trials to be held at White Bear. This boat is designed and built by "Ande" Peterson, of Lake Minnetonka, for the Loudon Brothers. Up to the last two or three years Mr. Peterson designed and built some of the fastest small boats in the country. This boat will be a pointed-nose scow, about 38ft. over all, and will have a moderate beam.

For the last four years the Minnetonka men have taken little interest in sailing, and it is pleasing to see that they are beginning to wake up again. There are some fine sailors at Minnetonka, and they should make a good showing in the Seawanhaka cup trials.

The Minnetonka people are buying a number of old boats from White Bear this spring and hope to start racing again as of old.

Gus Amundson built a class "A" boat toward the close of last summer that was not put in the water, and this boat will be entered in the Seawanhaka trials by the Frye Brothers, of St. Paul. It is a blunt-nosed scow, 38ft. long and, like all of Amundson's boats, has easy lines. This boat ought to make a good showing, especially in light weather. Besides the Seawanhaka challenger, Amundson has built a class "A" boat for one of the inland lakes of New York, and one for Long Island. Mr. Lyford, of Fox Lake, has ordered an "A" boat from Amundson, and he will undoubtedly enter her in the Inland Lake races at Oshkosh, which are to be held in the latter part of August. Three "B" boats have been built by Amundson, two of which will go to one of the inland lakes of Wisconsin, and the other will remain on White Bear, the property of the Owens Brothers, of St. Paul.

J. E. Ramaly, of White Bear, has built two class "B" boats, one to be owned by the Read Brothers, of St. Paul, and the other by the Ordway boys.

Perhaps it would be a good idea to give a general history and description of the class "B," which class has grown to be so popular in the West. When, previous to the formation of the Inland Lake Y. A., the Minnetonka and White Bear clubs were having match races, first at one lake and then the other, a class of boats was started with a limited sail area of 350ft. and the racing length of 17.5 feet. The weight allowed for the crew was 450 pounds. When the Inland Lake Yachting Association was started the weight of the crew was raised to 500 pounds. The class at present is very similar to the large class, rules for which were adopted several years ago and are exactly the same as those used in the international races for the Seawanhaka Cup at Montreal. Practically the only restriction is in sail area and there is no time allowance. The designer can build a long boat or a short boat, with whatever power he sees fit, the scantling rules are the same as in the class "A," sail area of class "B" boats is 350ft. of standing sail, with spinnaker and flying jib in addition.

Then length over all is limited to 32ft, with no limit to the waterline length. This class has grown so in

popularity and is so large on White Bear at the present time that boats have to be divided into two divisions. The first division consists of new boats, built every year, and the second consists of the old boats that have been raced the previous seasons. There will be at least twelve new boats this year and about eight last year's boats giving fully as large classes as can satisfactorily be handled. Besides two cups in each class there is a special cup offered each year for the championship; also a cup for points.

These boats are almost entirely sailed by sons of the members of the club, and are in many respects more adapted for pleasure sailing than the large boats. They are almost as fast, not so hard to handle and do not require as large a crew.

In several cases last year "B" class made the eight-knot course in less than one hour and fifteen minutes. In all there are something like thirty-five A and B sailboats being built at White Bear, most of which are almost completed.

A number of new launches, designed and built by J. E. Ramaly for men living at White Bear, will be added to the power fleet this season, and there is some talk of launch racing this summer. JACK ORDWAY.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

**COBWEB Y. C. ELECTS OFFICERS.**—At a recent meeting of the Cobweb Y. C., held at the club house, foot of West 152d street, North River, New York city, the following officers were elected: Com., Philp Grauer; Vice-Com., John H. W. Fleming; Fleet Captain, Wm. Ridley; Recording Secretary, Donald Manson; Financial Secretary, Charles Broughton; Treasurer, John Homan; Measurer, Fred Gegges; Fleet Surgeon, D. Garrick; Trustees, C. H. Madden, Edw. Fox, A. Feldhus, Chas. Demand, Wm. Houston, H. R. Halsey; Regatta Committee, John H. W. Fleming, Wm. Ridley, D. Manson.

The regatta committee has arranged for the following open races: May 30, Monday, spring regatta; Sept. 5, fall regatta.

**SUNBEAM PURCHASED BY EX-MAYOR LOW.**—Mr. J. L. Hutchinson, Morristown, N. J., has sold the steam yacht Sunbeam to ex-Mayor Low, through the agency of Mr. Stanley M. Seaman, New York. Sunbeam has a recorded speed of 19.2 miles. She is a double-planked mahogany boat, 60ft. over all, 8ft. 6in. beam and 3ft. 6in. draft, built 1903, by the Herreshoff Mfg. Co.

**BAY VIEW Y. C. ELECTION.**—The Bay View Y. C. held its annual meeting on April 12 and the following officers were elected: Com., Edward R. Karutz; Vice-Com., J. Fred Borghard, Jr.; Rear Com., George C. Miller; Fleet Capt., Harry Groth; Secretary, Edward Effinger; Financial Secretary, Paul Rosa; Treasurer, John Fraas.

**BERGEN POINT Y. C. OFFICERS.**—At a recent meeting of the Bergen Point Y. C., the following officers were elected: Com., M. S. Borland; Vice-Com., W. W. Grant; Rear-Com., J. C. Shaller; Secretary and Treasurer, W. R. Wilde; Fleet Capt., W. T. Barnard; Fleet Surgeon, J. G. L. Borgmeyer, M.D.; Measurer, W. E. Wadman.

**STEAM YACHT ADMIRAL SOLD.**—Mr. George R. Sheldon, N. Y. Y. C., has sold the steam yacht Admiral, through Messrs. Tams, Lemoine & Crane, to Mr. J. B. Edson. The same firm has chartered the steam yacht Seminole, owned by Mr. John N. Robins, to Mr. Walter S. Gurney; the steam yacht Mirage, owned by Rear-Com. Cornelius Vanderbilt, to Mr. E. F. Whitney and the British steam yacht Surf, owned by Mr. F. D. Lambert, to Mr. E. B. Alexander.

**POLLYWOG LAUNCHED.**—On April 3 the racing sloop Pollywog was launched at Oakland, Cal. The boat was built by her owners, Messrs. George N. Tyler and A. G. Buxby. Pollywog is a scow, 24ft. over all, 14ft. 6in. waterline, 7ft. breadth and 4½in. draft of hull. She will carry 350sq.ft. of sail and is fitted with a balance rudder and a dagger board. If Pollywog is as fast as it is expected she will be, a larger boat of the same general type will be built to race against Corinthian.

**NEW BOATS BUILDING AT WICK'S YARD.**—Four new boats are nearing completion at Mr. F. E. Wick's yard, at Amityville, L. I. One of the boats is for Dr. Ralph Tacoly, of New York city. She is 22ft. waterline and 36ft. over all. Her rig is of moderate size, and she will be used for cruising. Another boat is for Mr. John Thornton, of Brooklyn. She is a catboat, 32ft. over all. The 25ft. catboat ordered by the late Dr. J. M. Polk is also finished. Mr. Wick has built a 32-ft. racing boat for his own use.

**AMERICAN POWER BOAT ASSOCIATION.**—A meeting of the executive committee of the American Power Boat Association was held on April 13. Mr. W. H. Ketcham presided. Thirty-three clubs are now enrolled in the association as the Rhode Island Y. C., of Providence; the Hartford Y. C., of Hartford, and the Audubon Y. C., of New York city, have been elected to membership.

The following racing schedule was adopted: May 30, Association race; June 11, Columbia Y. C.; June 18, New Rochelle Y. C.; June 20, New York Y. C.; Glen Cove; June 23-25, Challenge cup race, Hudson River; July 2, American Y. C.; July 4, Indian Harbor Y. C.; July 16, Atlantic Y. C.; Aug. 6, Larchmont Y. C.; Aug. 11, New York Y. C.; Aug. 13, Manhasset Bay Y. C.; Aug. 18, New York Y. C.; Aug. 20, Brooklyn Y. C.; Aug. 27, Larchmont Y. C.

A resolution was adopted, stating that races held by clubs holding membership in the American Power Boat Ass'n should, if possible, restrict the entries to boats

owned by members of such clubs, except in the case of the New York, Larchmont and Eastern Y. C.'s.

The matter of issuing certificates of speed was disposed of in this way. A course of one nautical mile in length has been surveyed and laid out in Manhasset Bay, L. I. The executive committee of the association will name a member of the association who will, on notice, be at the Manhasset Bay Yacht Club house at Port Washington on the third and fourth Saturdays of May, June, July, August and September, 1904, for the purpose of certifying to the speed of power boats over this course.

Arrangements for timing must be made with the secretary of the association, at least one week's notice being given, and the application must be accompanied by a check for \$10 and a certificate of rating of the boat in the form used by the association, to which the association will annex its certificate of speed.

It was announced that the portion of the Grosvenor bill before Congress relating to pilots being required upon motor boats has been stricken out.

**COM. LAUDER'S APPOINTMENTS.**—Com. George Lauder Jr., of the Indian Harbor Y. C., has made the following appointments: Fleet Capt., L. D. Armstrong; Fleet Surgeon, Leander P. Jones, M.D., and Fleet Chaplain, the Rev. M. George Thompson.

**U. S. REVENUE CUTTERS REFITTED.**—Among the United States revenue cutters in which Roberts boilers have lately been installed are the Mackinac, Winnisimmet, Hudson, and Calumet.

The new revenue cutter, known as No. 12, now building by the Spedden Shipbuilding Company, at Baltimore, is also to have a Roberts boiler.

These boilers are 11ft. 6in. wide by 9ft. 3in. fore and aft. They have 70 sq. ft. of grate surface and 2,800 sq. ft. of heating surface, and furnish about 700 H.-P. each with natural draft in connection with triple expansion engines.

Several Roberts boilers have also been lately furnished for revenue cutters on the Pacific Coast.

Six Roberts boilers have also recently been shipped to the Cuban Government for installation in Cuban revenue cutters.

**OCEAN Y. C.**—The Ocean Y. C., of Stapleton, S. I., have elected the following officers: Com., Louis Birkle; Vice-Com., James Clark; Rear-Com., Samuel W. De Beer; Sec'y, John Schrone; Meas., James Dunn; Fleet Surgeon, Arthur Welch, M.D.; Trustees, Thomas J. McKnight, three years, and George Stapleton, one year; Membership Committee, Rudolph Michel, Reuben Mord and Fred Martens.

**KAYOSHK TO RACE IN SOUTHERN WATERS.**—Another Northern racing yacht has been added to the fleet of the Southern Y. C. Com. Frank H. Libby, of the Oshkosh (Wis.) Y. C., has sold through the agency of Mr. L. D. Sampson to the J. B. Campbell syndicate the crack Class A boat Kayoshk, one of the champions of the Inland Lake Y. A. Kayoshk is one of the latest and best of the productions of Messrs. Jones & La Bode. She will represent the Southern Y. C. in the races for the championship cup of the Southern Gulf Coast Y. A., for boats of the Seawanhaka cup type. The yacht clubs of the Mexican Gulf are fostering this class in order to participate in the international game next year. There is some talk even now of the club putting up a \$1,000 prize for an Interstate race for this class of boats next winter. Kayoshk was only ten points behind Comet II, winner of the championship of the I. L. Y. A. championship contest on Lake Winnebago last summer, the third boat being more than one hundred points behind the leaders. Comet II. would also have been purchased South, but her owners would not sell, as she is entered for the trial races of the White Bear Y. C., challenger for the Seawanhaka cup.

Kayoshk is the second racing scow to go South this spring, the well-known freak Caroline having been purchased by a member of the Southern Y. C. some weeks ago.

**NEW BOATS BUILDING AT GREENPORT.**—At the yards of the Greenport Basin and Construction Co., Greenport, L. I., several boats are being built. The largest of these is a cruising launch, which boat was designed by Mr. Theodore Brigham. She is 60ft. over all, 51ft. 6in. waterline, 12ft. breadth and 3ft. 3in. draft. The boat is equipped with a 40 horse-power Standard engine, which will drive her at a speed of about 12 miles.

Another launch is being built for a yachtsman who spends his summers at Shelter Island. She is 36ft. over all, 31ft. 2in. water line, 8ft. breadth, and 2ft. draft. This boat will have a Standard engine of 15 horse-power, and it is expected that she will develop a speed of about 10 miles.

The work on the cruising sloop for Mr. Benjamin Atha, of Newark, N. J., is well advanced. She is 41ft. over all, 25ft. waterline, 10ft. breadth and 6ft. 6in. draft. She will carry 1100 sq. ft. of sail.

**NEW BOAT FOR THE REV. LINDSAY PARKER.**—There is building at Mr. A. N. Harned's yard, St. Johns, N. B., a 20ft. waterline sloop for the Rev. Lindsay Parker, Ph.D. The boat will be known as Alana, and she was designed by Mr. Henry J. Gielow. She is 27ft. 6in. over all, 20ft. waterline, 10ft. 4in. breadth and 1ft. 7in. draft.

**WILLIAMSBURG Y. C. SCHEDULE.**—The following dates have been decided upon by the Williamsburg Y. C.: May 1, in commission; May 28-30, spring cruise; June 12, spring regatta; July 2-4, summer cruise; July 10, special race; Aug. 7, ladies' day; Sept. 3-5, fall cruise; Sept. 18, open fall regatta; Oct. 30, out of commission.

**NEW BOATS BUILDING AT FREEPORT.**—Several new boats

are being built at the yards at Freeport, L. I. Among them are the following: A 30-footer for Mr. John Slade, New York city; 46ft. launch for Mr. A. B. Cartledge, Philadelphia; 35ft. launch for Mr. Lorimer A. Cushman, New York city; 27ft. steam launch for Mr. Ernest Wrightmeir, New York city, and a 22ft. catboat for Mr. James Dean, Freeport.

**CRUISING RACE FOR CHICAGO Y. C.**—The Chicago Y. C. has arranged for a long cruising race from Chicago to Mackinac, to be held on Aug. 3, a distance of about 320 miles. The race will be open to all clubs on the Great Lakes. Suitable trophies will be offered for the schooner and sloop classes. A cup for the boat making the best time will also be given.

**OISEAU CHANGES HANDS.**—Mr. Harry Maxwell has sold his 30-footer Oiseau to a member of the Seawanhaka Corinthian Y. C. She may compete in the races for the Manhasset Bay challenge cup.

**SEAWANHAKA CORINTHIAN Y. C. FIXTURES.**—The race committee of the Seawanhaka Corinthian Y. C. is composed of Messrs. Henry H. Landon, chairman; Clinton H. Crane, Henry M. Crane, Victor I. Cumnock and Howard C. Smith, secretary. This committee has arranged the following schedule:

May 30 (Memorial Day)—Club races for raceabouts and 15-footers; June series races, first race.

June 4, Saturday—Club race for raceabouts and 15-footers; June series races, second race.

June 11, Saturday—Club races for raceabouts and 15-footers; June series races, third race.

June 18, Saturday—Club races for raceabouts and 15-footers; June series races, fourth race; Leland Cup.

June 25, Saturday—Thirty-fourth annual Corinthian race for all classes; raceabouts; Seawanhaka 15-footers; June series races; fifth race; Corinthian prizes.

July 2, Saturday—Club races for raceabouts and 15-footers; challenge cup series, first race.

July 4, Monday—Cup races for raceabouts and 15-footers; challenge cup series, second race.

July 9, Saturday—Club races for Alfred Roosevelt Cup, yaws; 15-footers; challenge cup series, third race.

July 16, Saturday—Club races for raceabouts and 15-footers; challenge cup series, fourth race.

July 23, Saturday—Club races for raceabouts; ladies' race; 15 footers; Hastings cups.

July 30, Saturday—Club races for 15-footers; challenge cup series, fifth race.

August 6, Saturday—Club races for raceabouts and 15-footers.

August 13, Saturday—Club races for raceabouts and 15-footers.

August 20, Saturday—Club races for raceabouts and 15-footers; challenge cup series, sixth race.

August 27, Saturday—Club races for raceabouts and 15-footers.

September 3, Saturday—Club races for raceabouts and 15-footers.

September 5 (Labor Day)—Robert Center memorial cups; classes to be named later.

September 10, Saturday—Fall regatta, Seawanhaka Club race, all classes.

**RECENT SALES OF YACHTS.**—Mr. Frank Bowne Jones has made the following sales through his agency:

The auxiliary yawl Vesta, by Mr. John H. Smedley, of Detroit, to Mr. George H. Bourquard, of New York.

The racing yawl Memory, by Mr. T. J. Preston, Jr., to Mr. H. Mason Raborg.

The auxiliary Venessa, which yacht is being fitted out at Morris Heights, for Detroit.

The sloop Pellegrina, sold, in connection with a Boston agent, to Mr. Robert Toland, of Philadelphia.

The power boat Imp, by Mr. John Cairns, to Dr. F. D. Bowne, of Richmond, Va.

The knockabout Trouble, by Mr. W. H. Childs, to Mr. William A. Barstow, of the Atlantic Y. C., and the Seawanhaka knockabout Hawk, by Mr. A. P. Hallett, to Mr. H. Schuyler Howe.

**CALYPSO SOLD TO SOUTHERN YACHTSMAN.**—The celebrated Hanley 25-ft. cabin yacht Calypso, champion of the Y. R. A. of Mass. for 1901 and 1902, has been sold by Mr. A. W. Chesterton, of Boston, through the agency of L. D. Sampson, secretary of the Southern Y. C., to Mr. S. F. Heaslip, of New Orleans, La. She will go South on the deck of a steamer of the Morgan line at once.

**POWER BOATS BY MESSRS. TAMS, LEMOINE & CRANE.**—Last week we stated that Messrs. Tams, Lemoine & Crane had gotten out plans for eight power boats. We gave particulars about two of them. The other boats are as follows:

A 50ft. boat is being built by Mr. Robert Jacob, City Island. She is for Mr. J. Insley Blair, and will be equipped with a 75 horse-power Smith & Mabley engine.

A boat, slightly smaller, is building at Morris Heights for Dr. Walter B. James. She is 44ft. long, 9ft. breadth, and her power consists of a 24 horse-power Panhard engine.

The Huntington Mfg. Co., New Rochelle, are building a boat 30ft. long and 5ft. 6in. breadth for Mr. A. C. Newbauer. This boat will have a 24 horse-power Panhard engine.

A 36ft. boat with 5ft. breadth is building for Mr. M. C. Hermann. She will be fitted with a 75 horse-power Smith & Mabley engine.

Two other boats will be built to the order of Messrs. Smith & Mabley. Both are 40ft. over all, one 5ft. breadth, and one 4ft. 6in. One is equipped with a 75 horse-power motor and the other with 150 horse-power.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

### New York City Corps.

THE New York City Corps began its summer practice shoot on the Union Hill range on April 13. The attendance was fairly good. The scores were not high owing to lack of previous practice. Aug. Kronsberg was first on the ring and man targets. John Facklamm was first on the point target.

Ten-shot scores, 25-ring target, distance 200yds.: Aug. Kronsberg 207, J. Facklamm 195, J. Keller 193, R. Busse 190, R. Schwanemann 189, R. Bendler 186, W. Grauetin 185, Ch. Wagner 179, H. C. Radloff 176, O. Schwanemann 174, A. Stolzberger 170, J. Moje 163.

Man target, 3 shots, possible 60: Aug. Kronsberg 56, Ch. Wagner 55, R. Busse 53, H. C. Radloff 48, R. Bendler 46, W. Graupentin 45.

Point target: John Facklamm 60, R. Busse 50, R. Schwanemann 35, Aug. Kronsberg 22, O. Schwanemann 21, W. Graupentin 21, R. Bendler 16, Ch. Wagner 14, J. Keller 5, L. Schultz 3, W. Wiltz 2, Ch. Metz 1, Louis Zietzmann 1.

Bullseye target: Aug. Kronsberg 4, J. Facklamm 4, W. Graupentin 4, H. C. Radloff 1, R. Bendler 1, R. Schwanemann 1, J. Keller 1, O. Schwanemann 1.

### Cincinnati Rifle Association.

CINCINNATI, O.—The following scores were made in regular competition by members of the Cincinnati Rifle Association, at Four-Mile House, Reading road, April 10.

Conditions, 200yds., offhand, at the 25-ring target.

Payne was champion for the day with the good score of 229.

A strong fishtail wind blew all day from 3 to 6 and 9 o'clock quarters:

Payne .....	229	217	217	216	215
Roberts .....	221	218	217	217	210
Hasenzahl .....	221	213	207	203	200
Nestler .....	219	210	209	208	208
Odell .....	215	212	202	201	200
Freitag .....	215	193	190	186	179
Bruns .....	211	207	184	183	...
Hofer .....	210	207	206	204	203
Lux .....	209	208	206	202	199
Hoffman .....	197	192	185	183	183
Troutstone .....	197	195	188	178	176
Uckotter .....	192	189	182	179	179

### Zettler Rifle Club.

THE scores of the winter gallery shoot of the Zettler Club have been of a high order. Capt. W. A. Tewes is in the lead and will finish in first place:

Ten-shot scores, 25-ring target, distance 75ft., offhand:

One hundred shots: Wm. A. Tewes 2460, L. C. Buss 2442, L. P. Hansen 2445, G. J. Bernius 2284.

Fifty shots: Aug. Kronsberg 1219, A. Moser 1208, C. G. Zettler, Jr., 1203, H. C. Zettler 1200, W. A. Hicks 1197, B. Zettler 1189, L. Maurer 1188, C. G. Zettler, Sr., 1184, A. Bergerow 1175, H. Fenwirth 1174.

Extra scores, 100 shots: Wm. A. Tewes 2440.

Fifty shots: L. P. Hansen 1202, G. J. Bernius 1153.

### Rifle About New York.

THE New York Central Corps will hold its first outdoor shoot for the coming season at Union Hill Park, on April 21.

The Harlem Independent Corps will hold its first practice shoot on the Union Hill range on April 25.

The New York Corps, under the leadership of its new captain, John H. Hainhorst, will hold its first practice shoot at Union Hill Park on Friday, April 29.

The New York City Corps will hold its second shoot in the summer practice at Union Hill on April 27.

The Zettler Rifle Club will open its outdoor practice shoot at Union Hill on the first Saturday in May, and the members will practice every Saturday during the month. The club pays the expense of the targets.

### Rifle Notes.

The daily press recounts the death of Dr. Sumner Paine. He died at his home in Boston, on Monday of this week. His death was caused by pneumonia. He was one of America's greatest and most famous pistol shots.

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

### Fixtures.

April 20-21.—Rensselaer, Ind., Gun Club amateur tournament. Everett Brown, Mgr., Pleasant Grove, Ind.

\*Aug. 25-26.—Tarentum, Pa., Rod and Gun Club.

\*Western Pennsylvania Trapshooters' League tournaments. C. G. Grubb, Sec'y, Pittsburg.

## DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

Mr. Elmer E. Shaner, secretary-manager of the Interstate Association, informs us that the tournament scheduled for Dallas, Tex., May 17 and 18, has been cancelled.

The Aquidneck Gun Club, of Newport, R. I., has arranged a series of thirteen shoots for a silver cup, presented by Mr. P. H. Powel. The first one of the series was held on April 13.

On Wednesday of last week the New Jersey Legislature, in special session assembled, passed the bill prohibiting pigeon shooting in New Jersey. The bill takes effect on and after July 4.

The captain-manager, Mr. Robert R. Skinner, informs us that the Ashland Gun Club, of Lexington, Ky., holds club shoots on the first and third Tuesdays of each month, and that all visiting sportsmen are welcome to shoot with them for targets only.

Mr. Louis Williams, of Nashville, Tenn., one of the Winchester Repeating Arms Company's ablest representatives, is convalescing from a severe attack of malarial fever, of which he has been the victim during several weeks past. The multitude of friends of Mr. Williams will rejoice over his recovery.

Mr. John W. Dickinson defended his title to the Arkansas State live bird championship and the Peters Cartridge trophy, emblematic of the title. The match took place at Little Rock, Ark., on April 8. The challenger was Mr. Nick Peay. The scores were 23 to 19, Mr. Peay losing four dead out.

The silver loving cup, which has been an object of keen competitive interest to the members of the Montclair, N. J., Gun Club, was won by Mr. Ezra H. Fitch, at the club shoot on Saturday of last week. On Saturday of this week the Montclair Gun Club has arranged to shoot a return team match with the Montclair Golf Club.

Ossining, Schenectady and Poughkeepsie teams are due to collide on April 23, at Poughkeepsie. Capt. C. G. Blandford, elsewhere in our trap columns, mentions a change of the Decoration Day programme, which will please the visitors, namely, the 25-target event will be \$2 instead of \$2.50 entrance, and a trophy will be presented to the shooter who makes high average.

The programme of the Wawaset Gun Club, presented for their tournament, to be held on May 12 and 1, has twelve handicap events each day, 15 targets, entrance \$1.30, \$5 added. Shooting will commence at 9 A. M. Dinner will be served in the grounds. Handicaps, 16 to 20yds. The committee members are: L. J. Squier, Edward Melchior, Jr., J. T. Skelly, Stanley Tughton and William M. Foord.

At the Indiana State League tournament, at Indianapolis, Mr. Ralph Trimble was high man, with a total of 387 out of 420 targets for the two days, April 12 and 13. In the amateur class Mr. Ernest H. Tripp, one of America's most popular and skillful amateurs, won high average with a total of 360. Mr. Edward Faust, of Warren, won the State badge. The team badge was won by Messrs. J. W. Bell and Jos. Michaelis.

The Dubuque, Ia., Gun Club, has issued the programme of its amateur tournament, to be held May 17-18. There are twelve target events each day, eight at 15 and four at 20 targets, entrance \$1.50 and \$2; \$5 added to each event. There are ten average prizes, \$5 each. No bang, no bird; but no bang and a fair bird is a lost bird. Targets, 2 cents. Shooting commences at 9 o'clock. Ship shells and guns to the Dubuque Brewing and Malting Co. Hon. Tom Marshall will be manager, and Mr. Fred C. Whitney will be secretary.

Mr. Hood Waters is at present touring through Kentucky, and in that land of pure spring water, fast horses and beautiful women, his sterling trapshooting skill and gentlemanly qualities have won admiration and friendship. At Lexington, Ky., at the club shoot, he broke 91 straight and 98 out of 100. The total for him in the afternoon was 145 out of 150, including ten pairs. Mr. Woolfolk Henderson made the excellent score of 73 out of 75. Mr. Robert R. Skinner broke 49 out of his first 50, then seemingly grew careless, as he only broke 71 out of 75, something over a 94 per cent. gait.

Dr. C. H. Burr writes us as follows: "The annual meeting of the Montpelier Gun Club, of Montpelier, Vt., was held on April 4. The following officers were elected: President, Frank R. Dowley; Vice-President, Geo. B. Walton; Secretary and Treasurer, Dr. Clarence H. Burr; Captain, Geo. B. Walton; Executive Committee, Dr. L. A. Newcomb and J. E. Leland. Several new applications for membership were received. The club voted to install a Leggett trap, and make modern improvements at the club house. Considerable interest was shown at the meeting, and a prosperous year is assured. The club has about thirty-five active members."

The spring tournament of the Enterprise Gun Club, of McKeesport, Pa., May 30, has ten events on the programme, 15, 20 and 25 targets, \$1, \$1.40 and \$2 entrance; totals, 180 targets, \$12.60 entrance. Targets 2 cents. Shooters may participate for targets only. In event 6, a Marlin shotgun will be first prize; \$5 in gold to each of the next three high guns, and twenty other good prizes. The club has two medals, both gold. Each is a work of art. The first, the Hunter Arms Company medal, is for members only. Competition for it is a series of ten contests, the first of which is April 22, the last Sept. 14. The other, the Daily News medal, is open to sportsmen of the club vicinity. For it there will be three contests, on April 30, and May 7 and 14.

BERNARD WATERS.

## Rochester Gun Club.

ROCHESTER, N. Y., April 13.—The long struggle between Messrs. Harry M. Stewart and Thomas F. Adkin for the diamond medal emblematic of the county championship, resulted in favor of the latter at the shoot of the Rochester Gun Club to-day. This was their fourth shoot-off of the tie which occurred two weeks ago, when Stewart defended the trophy. Two weeks ago yesterday Adkin and Stewart tied for high gun and again tied in two successive shoot-offs. Last week Wednesday there was another tie between them.

The snow bothered the shooters yesterday. Stewart had retained the diamond medal since it was first offered. The scores in yesterday's shoot-off follow:

Adkin .....	23	22	24	24—93	Stewart .....	23	23	25	22—92
There were more members in attendance than usual. The diamond medal contest was the attraction. The scores:									
Broke. Hdcp. Tot'l.					Broke. Hdcp. Tot'l.

## New York Athletic Club.

TRAVERS ISLAND, N. Y., April 16.—There were several trophy events shot for to-day at the shoot of the New York Athletic Club. For the Sauer trophy there were fifteen contestants. The conditions were 50 targets, handicap allowance added. The scores: Dr. Knowlton (4) 42, McAlpin (4) 49, Foot (12) 27, Norton (8) 41, King (15) 38, Greiff (4) 40, Kintner (20) 37, Koch (20) 41, Montague (20) 42, Barnes (5) 42, Rainey (6) 38, H. Norton (8) 39, Carr (8) 40, De Long (18), Sidam (12) 29.

Tie, 25 targets: Knowlton (2) 19, Montague (10) 23, Barnes (2) 23.

Second tie: Montague (10) 21, Barnes (2) 19.

April cup; won by W. Norton; fifteen contestants. The scores: Dr. Knowlton (2) 19, McAlpin (2) 21, Foot (6) 12, King (8) 24, Greiff (2) 25, Kintner (10) 23, Koch (10) 23, Montague (10) 23, Barnes (2) 23, Rainey (3) 17, Norton (4) 21, Carr (4) 19, De Long 13, Sidam (6) 15.

Shoot-off: Norton (7) 25, Greiff (2) 24.

Rainey cup: McAlpin (1) 18, Foot (6) 17, W. Norton (7) 25, King (8) 20, Greiff (2) 24, Kintner (10) 22, Koch (10) 18, Montague (10) 21, Barnes (2) 19, H. Norton (4) 25, Carr (5) 25.

Shoot-off: W. Norton (7) 25, H. Norton (4) 24, Carr (5) 21.

## Ossining Gun Club.

OSSINING, N. Y., April 16.—Appended you will find the scores of the Ossining Gun Club, made at the regular bi-monthly shoot. We must blame the small attendance to the weather. A full gale blew out of the northwest, directly across the traps, which made the shooting most difficult, as the scores will testify. The team of the Ossining Gun Club will go to Poughkeepsie next Saturday, 23d inst., to shoot against the Poughkeepsie and Schenectady gun clubs, 50 bluerocks per man. A fine shoot is anticipated.

Changing the programme of our Decoration Day, May 30, shoot, as published, last week, the 25 target event will be \$2 entrance, instead of \$2.50, and a trophy will be presented to the shooter making high percentage of breaks out of the 100 targets. Programmes will be sent on application to C. G. Blandford, captain, Ossining, N. Y.

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7
Targets:	10	10	25	25	25	25	25	Targets:	10	10	25	25	25	25	25

A L Harris.	8	8	13	12	16	19	16	W S Smith	..	6	..	..	..	..	..

C. G. B.

## Analostan Gun Club.

WASHINGTON, D. C., April 17.—The annual meeting of the Analostan Gun Club, of Washington, D. C., was held recently, and the following officers were elected for the ensuing year: Burridge Wilson, President; C. S. Wilson, Vice-President; Miles Taylor, Secretary; John Colcman, Treasurer; E. O. Craig, Captain.

Trustees: M. D. Hogan, W. R. Baker and W. H. Hunter.

New grounds have been secured on the Tennytown car line, overlooking the city, which are much more accessible than the old grounds on Analostan Island. The club, to be up to date, has ordered a Leggett trap, which will be installed this week. A new club house is being built, and when the improvements now under way are completed, the grounds will be the best any club has ever had in the District. New members are being added at each meeting, and the indications are at present that this will be a prosperous year for the club, and a lively one for the trapshooters in this vicinity.

Sec'y.

## Bristol Gun Club.

BRISTOL, Tenn., April 14.—Not many were out to-day. The boys are resting from their labors during the Interstate shoot.

We all had a very pleasant time. Some good scores were made. J. W. Gump has done remarkably well as a new shooter. His record has not been equaled by any new member. Messrs. Gillespie and Davis were visitors. The scores:

Targets:	25	25	25	25	25	Total.
A M Hatcher	25	25	23	24	25	147
R M Crumley	19	22	22	23	22	131

J S Gillespie	8	14	..	..	..	..
T F Davis	4	12	..	..	..	..

S. W. RHEA, Sec'y.

## Mt. Kisco Gun Club.

Mt. Kisco, N. Y., April 13.—The Mt. Kisco Gun Club held their first regular club shoot of the season to-day. Too much strong wind for high scores prevailed. But the traps worked exceptionally well, and made very pleasant shooting.

In practice and sweeps, 558 targets were thrown, and not one left the trap broken. Pretty good record.

The club will shoot every other Wednesday. Next shoot April 27. The scores:

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6
Targets:	10	15	10	15	15	25	Targets:	10	15	10	15	15	25

## IN NEW JERSEY.

## New York German Gun Club.

Carlstadt, N. J., April 13.—The shoot of the New York German Gun Club to-day was well attended, nineteen members participating in the main event at 10 birds. Kattengell was the star performer. He killed 10 straight in the main event, and 2 out of 5 in the sweep. The scores:

Kattengell	1111112222	10	Pfender	0210202121	7
Wellbrock	0002220201	5	Dannefeller	02010*1221	6

## Pattensburg Gun Club.

Pattensburg, N. J., April 15.—About twenty contestants took part in the tournament to-day. The scores below show the results. There were numerous prizes, and they were well distributed; yet Harry Gano, of the home team, took all the first prizes, winning a hammerless gun, a Marlin repeating gun, a gold watch, and was in for first money in sweepstakes.

The day was as nice as ever a day could be. Visitors were here from Baltimore, New York, Jersey City, Perth Amboy, Ringoes, Easton, and the surrounding towns. Our boys will soon put in a Leggett and hold a sweepstake shoot for a reopening. Due notice will be given. The trade was represented by J. M. Hawkins and H. Overbaugh. Mr. Hawkins did good work and left a good impression on the people here. Mr. Overbaugh, who has been with us before, has established himself with the boys, and they think things are not going right without him.

## Hudson Gun Club.

Jersey City, N. J., April 17.—The Hudson Gun Club held its second April shoot on April 17, and it was a good one; in fact, the best of the present year. The day was fine for target shooting and some good scores were made, especially the run of 34 by Schorty in the cup event.

Mr. George Piercy kindly donated two fine hand-painted steins as prizes for a 100-target race. Schorty started off as if he intended to make a runaway race of it by breaking 25, while Chas. Dudley broke 20 and F. Schoverling 21. The prizes were won by Chas. Dudley and Schorty. At the close of the 100-target event, it was found that Schorty and Piercy were tied. Pope, Jr., shot a good race for a beginner.

This club holds shoots every two weeks, the next being on May 1. The scores:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	15	20	25	25	25	25	25	15	25	10

## Montclair Gun Club.

Montclair, N. J., April 16.—There was a very good attendance at the shoot of the Montclair Gun Club to-day, and, notwithstanding the very high winds that were blowing, some very good scores were made.

The first event was the shoot-off of the tie for the Siever loving cup between Messrs. Charles W. Kendall and Ezra N. Fitch, 50 targets each. Mr. Kendall broke 29, which, added to his handicap of 11, gave him a score of 40, while Mr. Fitch broke 36, which, with his handicap of 5, gave him a score of 41, he just winning the cup by one point.

The second event was a match between the teams of the Montclair Golf Club and the Montclair Gun Club, 50 targets per man, six men on a team. The Montclair Gun Club won with a score of 209 to that of the Golf Club's 189, the defeated team having the pleasure of paying for the targets.

Messrs. Babcock, Fitch and T. E. Batten did particularly well, Mr. Batten showing the greatest improvement over past performances.

Messrs. Holzderber, Perley, Fitch and Batten shot with the Golf Club team to-day; they are, however, members of the Gun Club as well, but were needed to fill out the team of the Golf Club.

On April 23 the Gun Club expects to shoot a return match on the grounds of the Golf Club.

The scores are appended herewith:

No. 1, 50 targets, shoot-off of tie for Siever loving cup:

### Experiments with Shot.

To determine the striking power of shot for different ranges, the firing portion of the programme was completed some while back; but a good deal of time had necessarily to be spent in subjecting the results obtained to mathematic analysis. The experiments in question involved not only the taking of very complex readings, but additional care was necessary, by reason of the fact that we had set ourselves the task of bringing up to date the results published in these columns some eighteen years ago, as a result of the work which had then been accomplished in the same direction by Mr. R. W. S. Griffith. Where our own results differed from those previously recorded exceptional pains were necessary in order that we might feel justified in adopting revised values.

Mr. Griffith was fortunate in having the then editor of this paper, the late Mr. F. W. Toms, at his back as mathematical expert. His results were accordingly subjected to an exhaustive analysis, and the structure of calculation thus created was reported at length in a series of highly interesting articles. In following up this important piece of research, it became necessary to lay out a programme calculated to give us the greatest possible benefit to be derived from the improved apparatus which is now available. Our preliminary experiments, which were recorded in the issues already quoted, comprised, the firing of 50 shots, and from these most important information was obtained. We were able, by their aid, to lay down a programme of tests enabling us to obtain the striking velocity of every size of shot for every range from 10 to 40yds., inclusive. The total number of shots fired was only 40, and from these, 160 time measurements were obtained. In this way we were able to show a great improvement on the methods of eighteen years ago, the apparatus of to-day giving actually more and better information than was obtainable on the previous occasion by the firing of upward of 2,000 shots.

The method employed by Mr. Griffith was to take a series of different combinations of powder and shot charges and record the results obtained therewith at every range up to 60yds. We were able in our own case to replace these combinations with a single loading of cartridge, representing the standard which has been developed of late years, the cartridge in question giving a velocity of 1,660ft. per second over 20yds., with a shot charge of 1½oz. Furthermore, we decided that the velocities up to 40yds. would suffice for all practical purposes, and this again enabled us materially to cut down the number of observations required. Our preliminary experiments first of all gave us the very important information that all sizes of shot and all borings of gun gave practically the same mean velocities over the 20yds. range. That is to say, that, while small shot gave a higher muzzle velocity than the larger sizes, the ballistic advantage so gained was exactly compensated by their reduced ranging power after leaving the muzzle. In a similar manner it was found that, while choke barrels reduced the velocity of the charge in the act of passing through the constriction at the muzzle, the more compact flight of the pellets enabled them to recover this loss during their flight from the muzzle to the 20yds. screen. Thus, the results over 20yds. were similar, whether cylinder or choke bored guns were used. This extraordinary process of compensation, covering as it did the extremes of gun boring and the extremes of shot sizes, enormously cut down the range of work to be carried through. In fact, before the experiments had proceeded very far we were able definitely to ascertain that at or about 7yds. from the muzzle a standard loading of cartridge gave an equal velocity, independently of the size of shot or the degree of choking at the muzzle of the gun.

In the old experiments the striking velocity of the shot at the different ranges was obtained by a somewhat roundabout method. The velocities which were originally published gave the mean values from the muzzle to various distances up the range. Thus the velocity from 0 to 35yds. represented a certain time of flight, and the difference between this and the time obtained from 0 to 40yds. gave the time occupied in covering the odd 5yds. between the distances named. While a comparatively rough time measurement will give a reasonably exact result from 0 to 40yds., the difference between any two such times over adjoining distances must give only a very rough approximation of the true result. However, working from such information as was then available, Mr. Toms built up for shot sizes Nos. 5 and 6 a series of striking velocities at various ranges which he himself described as being as accurate as was humanly possible to obtain.

With the chronograph which we now use it is possible to erect wire screens at every distance along a given range, and to record with great exactitude the points of time at which the charge of shot progressively cuts the succeeding screens. In this way we were able to obtain from the firing of each cartridge four time-measurements. The range was thus divided into two sections, and a separate cartridge was fired for each of them. It was found that beyond 30yds. the results were so irregular as to render the readings obtained valueless. Hence we decided that the whole of our attention should be concentrated on the more consistent series of readings which were obtainable from 0 to 30yds. The averages so obtained were fairly consistent, and it was evident that the information required lay concealed somewhere amid the mass of figures that resulted from the 40 shots that were fired. Having before us a number of values which in some instances represented greater individual disconformity for one range than could exist between adjoining pairs of screens, it was necessary to bring to work a system of patient examination. By taking the rough averages, and by setting the same out in the form of curves, a general impression was obtained as to the time values that must exist in practice. Following upon this, the Bashforth system of calculating differences of velocity for different distances was brought into play, and we thus had side by side the results obtained from the instruments and those obtained by taking the observed velocity at a given distance as a basis of calculation, and finding therefrom the appropriate velocity for other distances forward or backward.

Having arrived at the conclusion that the differences of velocity to be recorded between the adjoining shot sizes were so small as to represent much less than the errors of the instrument itself, we decided to limit the sizes employed to Nos. 3 and 7. Having exactly defined these limits, we felt sure that the intermediate sizes could, with every justification, be fitted in mathematically in proportion to their relative sectional density. It was fortunate that this policy was adopted at an early stage of the experiments, because otherwise the enormous mass of figures involved would have defied the detailed mathematical treatment that we were able to accord to the handier number that were ultimately taken. By eliminating obviously false readings, and by selecting for mean values those figures which were in closest harmony with the other values obtained at other distances for the same size of shot, a harmoniously proportioned curve was in due course built up from the figures obtained. From this it was apparent that we had not,

after all, departed very much from the actual records which had been obtained in the experimental firings. The following tables show the selected values for Nos. 3 and 7 shot, together with details of the instrumental observations from which they were derived:

Characteristic values selected.....1185 1099 988 897

Taking the tabulated figures in the order in which they are given, it will be seen that we have adopted the arithmetical averages of the velocities recorded for the first 10yds., of the flight of the shot. Having made a curve setting out the results obtained up to the limit distance of 30yds., we selected 870ft. per second as the characteristic value for the velocity between 20 and 25yds., and we treated this as the absolute value at the midway point between these two screens. By working on Bashforth's system of calculation, we obtained the velocities for all the other distances recorded. We found that up to 10yds. the calculated values did not apply, this of course being due to the well-known fact that the air resistance encountered by a charge of shot on emerging from the muzzle of the gun is something between that of a solid spherical ball and that of the individual pellets comprising the charge. Between 10 and 30yds. we found that the results obtained from Bashforth were in close agreement with the actual velocity records obtained. We accordingly adopted for the characteristic velocity over each distance the results calculated on the Bashforth basis. The differences between the arithmetical averages and the figures which agree with the Bashforth formula and table are strikingly small. In fact, we believe that this is the first occasion on which a table of shot velocities has been published in which the recorded values agree with figures obtained from Bashforth. The records for No. 3 shot, as fired from a cylinder gun, are thus placed beyond question, and their exact agreement with calculations based on Bashforth laws for the flight of spherical projectiles justifies us in assuming that for distances beyond the range at which records were taken the striking velocities may be worked out by calculation alone, our experiments having shown us that beyond 30yds. the instrumental readings are too irregular to be of value. We accordingly found by calculation that the striking velocity at 40yds. of a No. 3 pellet, traveling in the manner indicated in the table up to 30yds., must be 706ft. per second.

The second table shows a similar series of readings for No. 7 shot. The marked increase in velocity over the first 5yds. may, by reason of the information obtained in our earlier experiments, be attributed to the increased chamber pressure which arises through the presence in the cartridge of a small size of shot, the extra resistance increasing the strength of the powder to an extent sufficient to impart a considerable amount of extra muzzle velocity. Between the 5 and 10yds. screens the velocity is practically the same as that of No. 3 shot, and thence onward there is a gradually increasing separation between the two sets of records. We thus see that a velocity of 816ft. per second for No. 3 shot between 30 and 35yds. becomes 758 for No. 7 shot. Working forward by calculation, we found that the 40yds. striking velocity of No. 3 shot, viz., 706ft., becomes 629ft. in the case of No. 7. Before leaving the second table, attention may again be called to the remarkable conformity that exists for most distances between the average values obtained by experiment and those selected as characteristic for the size of shot under consideration. The only exception occurs in the case of the 10 to 15yds. record, the value 968 being obviously a false one, due to instrumental errors. For the purpose of our calculated values, 823ft. per second was adopted as the characteristic 20 to 25yds. velocity. This gave 758ft. between 25 and 30yds., as compared with the 744ft. for the experiments. By cutting out the individual record 711, we obtained for the remaining figures an average velocity of 753ft. This correction was fully justified by reason of the facts which were made clear in the course of the systematic examination of the figures which was conducted. Following the practice adopted with No. 3 shot, the values fixed for the first 10yds. were the strict arithmetical averages obtained from the experiments.

The results so far quoted relate exclusively to the shooting of a cylinder gun. In the third table the records obtained with choke boring are duly set forth. The figures obtained up to 20yds. only are recorded, the values beyond that distance being analogous to those adopted for the cylinder records. The choke results with No. 3 shot for the first 5yds. are identical for shot size No. 7, the assumption being that anything that may be gained in velocity by the small sizes of shot is exactly counterbalanced by their extra loss in passing through the choke at the muzzle. Beyond 5yds. the records so nearly agree with those registered from the cylinder barrel that we decided that, in dealing with striking velocities, choke and cylinder barrels might be treated as giving

the same results. It will be seen that the choke gun records are not so regular as those obtained in the case of the cylinder. For instance, with No. 7 shot from 10 to 20yds., the 10 to 15yds. value is obviously too low, while that from 15 to 20yds. is nearly as erroneous in the opposite direction. This implies that the time recorder at 15yds. had got out of adjustment, with the result that the intervals for the adjoining distances were measured one too high and the other too low. In the case of the choke gun and No. 3 shot the conformity with the cylinder results was much better maintained, and the agreement for the distances beyond those recorded in the table was still more marked. In fact, the average velocity registered between 25 and 30yds. for No. 3 shot in a choke barrel was identically the same as was obtained in the firing of the cylinder. Thus, all things considered, and in the light of the careful checks which we applied to the figures obtained, we have good reason for saying that choke boring does not influence the velocity of shot charges for a greater distance than 10yds. from the muzzle.

This, for the moment, completes the figures and conclusions to be put before the reader. It will be seen that we have obtained a thoroughly consistent series of records for Nos. 3 and 7 shot for all distances up to 30yds. From 10yds. onward the values recorded are in complete harmony with Bashforth's laws relating to the flight of spherical projectiles. This agreement between theory and practice justifies us in continuing the values up to 40yds. by calculation alone, and so far as that is concerned, we could go even further. The limit arises when the striking velocities go below 500ft. per second, when the rules no longer apply. In order to obtain the absolute striking velocity at all points from 10 to 40yds., we have laid out the records in the form of curves. By so doing, we have been able to read off the velocities at 5yd. intervals along the range, and a table for the two extreme sizes of shot dealt with has been built up accordingly. Curves representing the intermediate sizes of shot were then introduced by calculation between the extremes so defined; the particular position allocated for each curve being determined by the sectional density of the size of shot under consideration.—London Field.

### Division of Moneys.

UTICA, N. Y., April 16.—*Editor Forest and Stream:* I would like to say a word about division of moneys at small shoots. I will take the State of Pennsylvania, for I am better known there. There are not more than twenty-five men in the whole State who are fit to shoot high guns or Rose system, that is, who have a chance to keep in the money, while there are over twenty-five hundred who are fit to shoot the Jack Rabbit system; that is, \$1 entrance, birds extra. A shooter gets 10 cents for every broken target, and the 10 cents for every unbroken target goes into a pot to be divided as the management sees fit. At Millville, Pa., last fall, a father entered for himself and son for two days, \$70; bought 800 shells. They shot about 75 per cent. apiece, and were paid \$6—pretty expensive sport. As it is, they very likely will never come again.

Now with the Jack Rabbit system it would have been impossible for them to lose more than 25 per cent. At Johnstown, Pa., Sept. 17, 1903, the Jack Rabbit system was used. Forty-two men shot altogether, and it was optional to shoot for targets only; but every man, mind you, shot for money. The grand average for that shoot was less than 70 per cent. Yet, not a man withdrew, and many never got above 50 per cent. John Dennicker made more money at this shoot than any one he attended last year. At an Interstate or an open, free-for-all, high guns, Rose system or class system is the proper way to divide money, as no one has any business there but a man who is a good shot. But for the one and two days' shoots throughout the country the Jack Rabbit system is the best, for it brings in the rank and file of field shooters and others that run from 40 to 75 per cent. Mr. Good Shot will get all the money at this system, but Mr. Poor Shot will get a run for his money, and get on speaking terms with the cashier and learn a trick or two about the game while he is doing it. This system was invented by Mr. Charles Brelsford, president of the Harrisburg Association, when I had the honor of being a member, fifteen years ago. The Worden brothers were then, as they are now, officers of that club, and it stands out as one of the most progressive gun clubs in the United States. The Jack Rabbit system was largely responsible for holding this club together, and I do not know of another one in the United States that has not missed a meeting. If any one does not understand this division and will write me, I will send him a little booklet explaining it.

E. D. FULFORD.

### Remington Gun and Rifle Club.

ILION, N. Y., April 13.—The annual meeting of the Remington Gun and Rifle Club was held at their rooms, in the armory, last evening, and the following officers were elected to serve for the ensuing year: President, G. E. Humphreys; Vice-President, H. H. Bassett; Secretary and Treasurer, W. H. Grimshaw; Captain, R. H. Tomlinson; Collector, Charles Jenne; Trustees: L. N. Walker, W. F. Lawrence, J. F. Loy, J. Haltmar, G. S. De Lany, T. Corbin, J. D. Pederson, F. A. Russell.

The past season has proved a very successful one for the club, and it is expected that the coming season will be a lively one with the boys. The club has a membership of forty-five, and have ample grounds, with a suitable club house, which is easily reached by trolley. During the past season there has been built a 200yd. rifle range, which is greatly enjoyed by the rifle shooting fraternity. In addition to the magautrap used by the club, there will be set up this season expert traps for practice use. This addition to the trapping facilities will be much appreciated by the members, as it gives them an opportunity to practice over both kinds of traps.

Weekly shoots will be held on the rifle range and at the traps, and the committee of the club are actively engaged in arranging tournaments to take place early in the summer.

### Aquidneck Gun Club.

NEWPORT, R. I.—The events at Wednesday's shoot of the Aquidneck Gun Club, inaugurated a new series of thirteen matches for a silver cup, presented by Mr. P. H. Powel under the following conditions: Each match to take place on alternate Wednesdays at 50 targets, unknown angles, the total of ten best scores to win. A distance handicap to govern, as follows: The winners to go back one yard with each successive win up to 20 yards, returning to 16 yards upon another winning a match. Ties to be shot off at 10 targets, expert rules. A superior lot of scores were the result of the first match, as follows:

Targets:	10	15	10	15	T'l.	Targets:	10	15	10	15	T'l.
Hughes .....	10	10	10	13	43	Mason .....	9	11	8	11	39
Powel .....	9	9	9	14	41	Bowles .....	9	9	8	13	39
Alexander .....	7	12	8	13	40	Dring .....	8	9	8	12	37
Peckham .....	9	14	8	9	40

## WESTERN TRAP.

### Indiana State League Tournament.

INDIANAPOLIS, Ind., April 15.—The State League shoot was held here on April 12 and 13, and proved a grand success in every way, especially in the attendance, as there were seventy-five shooters, all told.

The conditions were somewhat against the shooters, as the scores will show; they are low for the traps and grounds used by the club selected for the 1904 Grand American.

Ralph Trimble was high man first day, though he lost 23; but on the second day he came forth strong, and lost but 10, thus scoring 387 out of 420, and taking high professional average with plenty to spare.

The highest amateur score was that of the well-known and much-liked Ernest H. Tripp, of the English Hotel fame. His score was 360.

Of the State events, the individual State badge was won by Edward Faust, of Warren, while the team badge went to Jos. Michaelis and J. W. Bell, of the Indianapolis Gun Club.

The traveling representatives were fairly plentiful: John Boa, Ralph Trimble and Fred Lord. Jim Head was the head shooter on the list. He was first to the score and last man to stop.

H. W. Vietmeyer was present, and made new friends while expounding in the interest of the powders he exploits.

Jack Fanning was surely there, making little smoke save of the targets, as his load ground out 193 the last day.

Kirby was busy for his company, and shot the whole programme through.

The officers and members have held such good tournaments here that they are accustomed to handling big crowds. With Mr. Allen as secretary and office man, everything moves off smoothly.

No one had any "kick coming" save on his poor shooting, and when the scores are so generally low, the high men loom up finely by comparison.

The Indianapolis and the Indiana shooters are very enthusiastic over the prospects of the G. A. H. being the greatest ever brought off in the shooting world. The scores:

### Witt Gun Club.

Witt, Ill., April 13.—Now that the ducks have gone glimmering, so far as the open season is concerned, there will be something on now and then at the traps.

The opening club shoot was held Tuesday, shooting at 25 targets: Hartline 20, Dean 21, Payne 17, Teeters 18, Redmond 16, Hess 14, Jester 13.

### Hazlehurst Gun Club.

Hazlehurst, Miss.—The last meeting of the newly organized gun club brought out some fine scores by J. H. Long, Jr., who shot at 75 targets, scoring 70. Lilly broke 34 out of 50, McKinnell 39 out of 50, Hawkins 12 out of 25, H. Miller 36 out of 50, Graves 36 out of 50, Woods, 60 out of 75, Granberry 35 out of 50, Lord 20 out of 25, Salter 16 out of 25, Granberry 19 out of 25.

### Morrisonville Gun Club.

Morrisonville, Ill., April 14.—The club members got out to-day and attempted to wear the rust off the long idle traps. This caused some unpleasant remarks. Then some of the gun barrels were rusty, and the finger triggers were sadly out of practice. The weather was fine, and that assisted all to try to look pleasant.

The boys will from this on keep up weekly shoots during the summer. The scores, shooting at 25 targets: Stout 23, Reasoner 24, Gibson 22, Manning 21, Clower 20, Wychopp 21, Turk 19, J. H. Stout 17.

### Missouri League Inaugural Tournament.

Pleasant Hill, Mo., April 8.—The first tournament given by the Missouri League of Trapshooters was held here April 7, under the auspices of the home club. The League officers were present, and each did his share toward making the meeting a success and in building up the League with the addition of new members.

There were some thirty odd of the braves present, and many more would have run down from Kansas City had not the weather been so threatening. The rain fell thick and fast after 11 A. M. up to the time of calling off the shoot, when 150 targets had been shot at.

Joe Leggett was present, and after regulating that new trap the targets were sent out, going good and plenty. Possibly some of the youngsters thought that the "saucers" would not break when they were wet; but that was no fault of Leggett's. Bob Elliott came down from Kansas City, and his shooting as portrayed by the scores herewith, will show that the trap was working well.

J. J. Cornett was there. Though high man by considerable over all (in inches), he was third high for the day, being but one less than the secretary.

W. H. Heer and Frank Riehl were present, and their good looks and good shooting added much to the enjoyment of the occasion. Heer was high man by a good margin, closing with 142 out of the 150, and the last 50 straight, though rain was in his eye. Water was better than Kansas sand in the eye.

Dave Elliott came also, and the smile was there, still, though not so long as usual, on account of the unceasing rain; yet, in the club house, he got off a few speeches as to the Ideal and High Gun shells.

Pleasant Hill shooters were there with their best foot forward, and yet they could not show to their best advantage owing to the dampness underfoot and overhead.

The next shoot will be held at the grounds of the Butler Gun Club. The scores:

Events:	1	2	3	4	5	6	7	8	9	Shot

Proctor	400	182	142	324	5.00

#### Watson Park Gun Club.

Burnside Crossing, Chicago.—There was a wind blowing cold and strong, which made the targets quarter swiftly to the right and made the shooting difficult. Each event was at 25 targets. The scores:

Events:	1	2	3	4	5	6	7	8

#### Ohio Trap.

#### Cincinnati Gun Club.

CINCINNATI, O.—April 16, was unusually cold for this time of year, and this may have had its effect on the attendance, which was not up to the mark. The afternoon was clear and bright, but enough wind was blowing to bother some of the shooters quite a little. In the Parker prize gun contest, Faran was high gun in actual breaks with 89. Pohlar and Randall tied for second on 84. Eleven of those shooting made full scores of 100, including their handicaps.

Ackley is once more able to attend the shoots, and his work at practice was fine, he breaking 40 out of 50 targets shot at.

The following notice was posted on the bulletin board in the club room, and Supt. Gambell prefaces the announcement by asking, "How many entries will I receive for this race? Who will shoot through?"

Amateur championship of the Cincinnati Gun Club at flying targets, ten races of 100 targets each, to be shot in strings of 25, all satnding at 16yds. First contest will be held on May 1, and one each succeeding week during May and June. The final contest on July 4. The championship of the club for 1904 and a handsome emblem will be given to the one making the highest average in the ten contests. Shooting to commence promptly at 3 P. M., and will be postponed only on account of bad weather. In such cases two races will be shot the following week. These contests cannot be shot in connection with any other club shoot. Entrance, price of targets only, with optional sweep of \$1 in each race, 60 and 40 per cent.

Parker prize shoot, 100 targets, handicap of added targets: Faran (18) 100, Pohlar (35) 100, Linn (25) 100, Pfeiffer (40) 100, Herman (30) 100, Captain (25) 100, Norris (30) 100, Bullerdick (30) 100, W. Weller (32) 100, Kramer (40) 100, Bochi (40) 100, Randall (15) 99, Block (18) 98, Maynard (18) 96, Jack (30) 95.

Team race, 100 targets, five 20s:  
Gambell .....17 17 15 15 17— 81 Medico ..... 16 19 17 17 14— 83  
Faran ..... 18 16 19 19 17— 89 Don Minto.. 15 15 15 14— 74  
35 33 34 34 34—170 31 34 32 32 28—157

The programmes for the tournament at Mason, O., on April 21-22, were distributed at the club to-day. The shoot consists of 180 targets each day, and several of the club members propose to go and try for some of the money. They may get some, but it won't be like finding it, as there are some good shots in the Mason club, such as Randall. A few of the Hamilton boys will likely be there also, and they can shoot a little.

#### Cleveland Gun Club.

CLEVELAND, O.—The club held its badge shoot on April 13, at the grounds on Mayfield Road. The attendance was small, Williams won the badge with a score of 44; Jack a close second with 43.

Club badge shoot, 50 targets; scores: Williams 44, Jack 43, Eadie 41, Martin 38, Hogen 36, Hopkins 29.

#### Rohrer's Island Gun Club, Dayton, O.

DAYTON, O.—The Rohrer's Island Gun Club's regular shoot was held on April 13, under hard weather conditions. A snowstorm with high wind prevented a larger attendance, and kept the scores low. Miller, C. Ballman and Schaerf tied for the medal, the former winning in the shoot-off.

Club medal shoot, 25 targets, handicap extra targets to shoot at. The scores, "shot at" and "broke," follow: C. F. Miller 28, 27; John Schaerf 31, 27; C. Ballman 34, 25; W. Kette 33, 24; H. Oswald 28, 23; J. W. Gerlaugh 27, 23; J. E. Barnes 32, 22; J. Sapp 35, 21; H. Nohr 28, 19.

Shoot-off of tie: Miller 11, 8; J. Schaerf 12, 7; C. Ballman 14, 7. BONASA.

#### Boston Gun Club.

BOSTON, Mass., April 6.—The regular Wednesday shoot of the Boston Gun Club was attraction enough for just ten shooters, and though the attendance was smaller than expected, the usual good feeling prevailed. The eleven events were replete with the interest that a trapshooter likes to see at any shoot.

High gun average of the day proved to be a battle royal between Allison and Griffiths, the former leading to the tune of one target, and placing to his credit a 90 per cent. average, an unusual event on these grounds. Griffiths' 89 per cent., however, was a good average, and his 22 in the prize match puts him at the top of the list, and is now at the mercy of the handicapper. Other scores:

Targets:	10	15	10	15	10	15	10	10	10	Av.
Frank, 18	8	12	8	13	14	9	12	6	..	82.0

#### Ashland Gun Club.

LEXINGTON, Ky., April 8.—The opening shoot of the season of the Ashland Gun Club was held Tuesday last, April 5, and it was in every way a success. The weather man furnished a bright warm day, and even if there was a stiff little breeze at times, it only tended to give a tilt to the targets and cause a few more "goose eggs" to be added to the scores of the boys, many of whom had not fired a shot before this year.

The management had provided some live pigeons, and they proved to be a most select lot; not a sitter in the entire number trapped, while some of them were screamers sure enough.

The Ashland has leased for the coming year the grounds of the old Belt Line ball park, right on the street car line, just outside of the city limits, an ideal place to shoot both live birds and targets, as the field and sky are all that could be wished for.

The membership of the Ashland is limited to twenty-five, and already there is a waiting list, showing the desirability and the marked advantage of a club whose members shoot simply for the love of it.

No one who is a resident of Lexington or Fayette county, and who is not a member of the club, is allowed to participate in any of the shoots; but visiting sportsmen who are introduced by any club member are most welcome guests of this exclusive and popular gun club. The scores of the last shoot are as follows:

Events:	1	2	3	4	5	6	7
Targets:	10	10	10	15	15	15	15
J Harp	7	8	6	11	9	9	8
R Skinner	8	9	10	15	15	14	13
R H Smith	5	6	8	13	8	..	..
G K Graves	7	4	..	7	..	..	9
Club event, 7 live birds:							
R R Skinner, 28	..	..	..	1111112	—7		
W Henderson, 28	..	..	..	0211221	—6		
F Van Deren, 28	..	..	..	1121200	—5		
C Clark, 28	..	..	..	0002100	—2		
J Harp, 28	..	..	..	0120021	—4		
R H Smith, 26	..	..	..	1211012	—6		
G K Graves, 26	..	..	..	1100201	—4		

#### Shooting Notes.

Several of the most prominent men identified with the trap-shooting game are using their every effort to effect an organization of the three gun clubs of Lexington with those at Georgetown and Paris, Ky., form a stock company and purchase, or lease for a term of years, suitable grounds located on some one of the interurban railways that connect these three cities, and have the most complete shooting grounds in Kentucky.

Articles of incorporation have already been granted, and several hundred dollars' worth of stock subscribed for.

The shooters of Paris, Ky., are very enthusiastic, and as they are all well-known trapshoots, and several of them very wealthy gentlemen, no difficulty has been experienced at that end thus far, the Paris boys only insisting that the new grounds be located easy of access to them.

The club at Georgetown is one of the oldest in the State, and is composed of some of the best shots in the State, and at

present they have their own grounds and magautrap located near their city. But it is understood that, as they are only twelve miles distant from Lexington and an equal distance from Paris, with electric cars every hour, they will assist in the consolidation.

At present there are three clubs at Lexington—the old Lexington club, the Fayette, and the Ashland—and it seems likely that the members of each will be glad to unite with the new organization, which will have every convenience necessary for shooters and their friends. MONT.

#### Montreal Gun Club.

MONTREAL, Can.—The rainy weather Saturday, April 9, did not keep the members of the Montreal Gun Club from coming out and taking a "whirl" at the traps. The first event was the spoon shoot, and the second event, the president's trophy:

Events:	1	2	3	4	Shot at.	Broke.
Targets:	20	15	20	20		
Dr Kearney	19	9	17	19	75	64
N Candlish	18	11	13	..	55	47
Landriault	18	9	14	16	75	57
Cote	18	7	..	..	35	25
McDuff	18	11	15	19	75	63
Edwards	17	11	15	16	75	59
Redmond	17	12	19	15	75	63
Hogan	17	8	..	..	35	25
Cooke	15	11	15	..	55	41
W Candlish	15	11	13	..	55	44

The Westmount Gun Club trophy was also shot off on the Westmount grounds, and was won by Mr. J. F. Hansen, with a score of 20, and Mr. R. Lewis stood second with 18 to his credit. S.

#### Holland Gun Club.

BATAVIA, N. Y., April 8.—The weather to-day was raw and cold, with a strong wind and a driving rain. The scores:

Squires .....	6	8	5	..	Clark .....	6	9	..	7
Douglass .....	4	7	..	..	Williams .....	5	8	7	8
Ames .....	8	8	7	..	Farwell .....	..	..	6	5
Gardner .....	4	9	1	7					

#### SIDE LIGHTS OF TRADE.

Concerning the Interstate tournament at Bristol, Tenn., reported in full in FOREST AND STREAM of April 16, the high average contestants, Messrs. Crosby, Money and Trimble, professionals, and the amateurs, Messrs. Hatcher and Bachman, used Winchester factory loaded shells. At Durham, N. C., April 5, J. J. M. Hawkins broke 99 out of 100, and 147 out of 150. Geo. L. Lyon broke 96 out of 100, and 140 out of 150. April 7, at Raleigh, Mr. Hawkins broke 97 out of 100 and was high man; Mr. Lyon was second. At Wilson, N. C., April 8, Mr. Hawkins broke 100 straight; R. E. Crawford was second; Mr. Walls third. At Frenchtown, N. J., April 7-8, L. J. Squier won professional high average; G. L. Wilson first, and S. W. Grubb second amateur average. All used Winchester factory loaded shells. Messrs. Hawkins and Squier used Winchester repeating shotguns.

We are informed that the Marlin Fire Arms Co., of New Haven, Conn., has come into possession of the American Cartridge and Ammunition Company, of Hartford, and on April 12, commenced removing the machinery to their New Haven plant. They purpose to manufacture cartridges on a large scale.

In the recent match for the Arkansas State championship at Little Rock, Ark., April 8, between Messrs. Dickinson and Peay, each contestant used Peters factory loaded shells.

#### PUBLISHERS' DEPARTMENT.

#### Pennsylvania Railroad's Washington Tours.

THE Pennsylvania Railroad's eighth three-day personally conducted tour to Washington will leave New York, Brooklyn, Newark, Elizabeth, and Trenton, April 28. Round-trip rates—only difference being in the hotel selected in Washington—are \$12 and \$14.50 from New York, \$10.50 or \$13 from Trenton, and proportionate rates from other points. Tickets cover railroad transportation for the round trip and hotel accommodations. A special side trip to Mt. Vernon may also be taken. All tickets are good for ten days, with special hotel rates at expiration of hotel coupon. For itineraries and full information apply to Ticket Agents; Tourist Agents, 263 Fifth avenue, New York; 4 Court street, Brooklyn, or Geo. W. Boyd, General Passenger Agent, Broad Street Station, Philadelphia, Pa.

The reels manufactured by the Carlton Manufacturing Company, of Rochester, N. Y., are fully described in the illustrated catalogue which they send free on application. Among these are their automatic reel and their nine-multiple reel, in which a single revolution of the handle makes the spool revolve nine times, giving thus extraordinary speed and power. The subject is one of keen interest to all anglers.

#### New Advertisements.

The national trolling gang manufactured by Joseph E. Pepper, of Rome, N. Y., appeals strongly to that multitude of anglers who catch their fish by trolling. Two cents in stamps, sent to the manufacturer, will bring a catalogue describing the different sorts of fishing tackle that he manufactures.

## BAKER SPECIAL PARAGONS.

Strictly high grade. Built to order at regular prices. \$60, \$75, \$200 and up. Carefully fitted and highly finished. Baker guns have a long established record for hard shooting and great durability.

Send for FREE QUARTERLY and 1904 booklet fully describing all grades.

**BAKER GUN AND FORGING CO.,**

Cor. Liberty & School Sts., BATAVIA, N. Y.

## MY TRAP SCORES

A pocket trap score book, containing 50 pages of score sheets and the Interstate Association Rules for target and live bird shooting, and for shooting under the Sergeant System. The cover bears the title "My Trap Scores," and the pages, in number and form, are arranged to make a complete record of the shooter's doings at the traps. The pages are ruled to make a record of the place, date, weather conditions, number of traps, number of shooters, gun and load used, events, etc. The score sheets are ruled for 25 targets. Bound in leather. Price, 50 cents.

FOREST AND STREAM PUB. CO., 346 Broadway, New York.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, SATURDAY, APRIL 30, 1904.

VOL. LXII.—No. 18.  
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

### THE ALDER RUN.

To the dweller in New England or the Middle States the alder run needs no description. It is one of the most familiar features of a pleasing landscape. Seen at a distance, either from level fields through which it passes, or looked down on from high banks which form the sides of the ravine which it has cut out, at this season it seems a mere line of pale gray, which, when approached, separates itself into twigs and branches, and seen near at hand becomes an interlacing tangle of close set, stout, tough stems. Hidden away among these stems, winding among grass tussocks and rippling over stones, trickles the brook, large or small, which has cut out the way for itself through the field's fertile soil, and along whose moist borders grow the alders of the run.

Though the most numerous and the most evident of the vegetation of the run, the alders do not grow here alone. There are soft maples, and at the edge of the higher ground a birch or two, an elm and an ironwood. If in its passage the run curves round the foot of some gravelly knoll, the elevation may support a big oak, some cedars and some chestnuts. The vines of blackberry, grape and ivy, and shrubs like shadblow and viburnum grow in wild profusion among the alders and the larger trees, and often make it a difficult task to push a way through the tangle.

Almost the first spring flowers are seen along the borders of the little stream; skunk cabbage, hepatica, yellow primrose and anemone, and a little later the dog-tooth violet, brave in the yellow plumes which it waves above its green and purple uniform. In these days, when the May flower, or trailing arbutus, has become nearly extinct in so many localities, even these simple and perishable flowers have value as they have beauty.

Long before these spring flowers have started, there is something worth seeing in the alder run. The first woodcock, coming from the south to brave the boisterous blasts and severe cold of February and March, dropped in here and prodding with his long bill in the soft places overrun by the warm waters, found sustenance to keep him strong during the time of mating and of nest building. All through the winter, nuthatches and kinglets and titmice, with the downy woodpecker, have foraged through the alder run, and turning over the curled up dead leaves still clinging about the bases of the trees, gleaning through the crevices of the bark, working over and over again crannies of the old rail fence, have striven hard for a living and have found fuel to fight off the winter's cold and to keep themselves lusty, fat and strong all through the bitter season. Later the tree sparrow and blue junco drifted into the run to feed and sleep, and later still the curious rustlings which sounded from the ground there told that the fox-colored sparrows, and afterward the towhee buntings, were scratching there among the leaves as busily as ever hen scratched in garden bed.

As spring advances, other birds will use the run for a summer home. The oven bird will construct his curious roofed home, thrushes will build, and warblers will have their nests there, and then the alders and all the vegetation will become green and beautiful while summer flowers are budding and blooming. Then, after the young are reared, and the heats of summer have passed, and the fall migration begins, the run will still be a resting and feeding place for a host of birds.

Thither, when autumn frosts have nipped the vegetation and leaves are falling, sportsmen will go, and, sending in the dogs, will walk in the field outside the run, hopeful of starting a woodcock or partridge, which, rising from the narrow line of brush, will be sure to offer a shot to those who are beating it. Later still, if there be a wheat or rye stubble near the run, the brood of quail feeding on the stubble will be likely to make the run a refuge to which they may fly when started by dog or

gunner. If a brood takes refuge in such a place, they may easily be killed, and the whole covey may be exterminated in a few days' shooting. Remember, then that in these days birds are not too common, and spare at least the half of those that take refuge in the alder run.

### NEW YORK PHEASANT BREEDING.

THE New York Forest, Fish and Game Commission has announced that no more pheasants will be bred for free distribution by the State. The last distribution, Feb. 1, included all the birds in the pens at the Pleasant Valley hatchery. These were sent out to 57 different localities.

Pheasant breeding at the Pleasant Valley hatchery began in 1896. The first lot bred were not released, and the following year the stock amounted to 180 birds. In all, between 1,000 and 1,100 birds were distributed, and the applications received during the year which closed Feb. 1, if they had all been filled, would have required 238 pairs of pheasants.

The experiment has been an unqualified success. Many individuals and a number of fish and game protective clubs throughout the State have undertaken the work of breeding and distributing the birds. In many sections those turned out have done well, standing the severity of our winters quite as well as our native birds, often much better than the quail. The introduction of these birds in New England and the Middle States is still in the experimental stage, but in a mild climate like that of the coast region of the northwest United States and British Columbia, the birds have done admirably, and have added a fine game bird to the sportsman's list. As yet we hardly know just what they will do in the East, but it is probable that they will survive and do well even though their increase may be slow.

### FOR A NEW NATIONAL PARK.

The bill introduced in the House by Mr. F. W. Cushman, of Washington, providing for the establishment of a national park in the State of Washington, to be known as the Elk National Park, ought to become a law. It has recently been favorably reported from the Committee on Public Lands by Mr. Shiras, has the approval of all the officials of the Interior Department, and appears to be earnestly desired by the residents of northwestern Washington.

The bill provides for the setting aside as a national park of about 615 square miles of territory in the Olympic Forest Reserve for the purpose of preserving the elk, game fish, birds, animals, timber and curiosities therein. The territory is a wilderness of broken mountains, of which only about 4,000 acres out of nearly 400,000 have been surveyed. Claims have been established on only 1,280 acres.

The region is from 5,000 to 7,000 feet above the sea level, is cut by numerous valleys and streams with prairie and timber and bench land, covered with wild grasses, but for the most part the mountains are heavily timbered. It is the natural home of the elk, deer, bear, cougar and other wild animals. The streams abound in trout.

Here is to be found the only considerable band of wild elk in the United States west of the Rocky Mountains. They are the species described as Roosevelt's elk, and are rapidly being slaughtered for their teeth. An authority declares that there are not now more than 500 elk remaining there, whose range is about the headwaters of the Elwha and its tributaries, and the Solduck, Hoh, Queets and the Quinault rivers.

The territory proposed to be set aside in the bill includes the summer and winter home of the elk, and is most of it absolutely unfit for settlement. Being within the forest reserve, the few settlers occupying the 1,280 acres above referred to will probably be very glad to exchange their claims within the national park area for other lands outside of it.

At the rate at which these elk are being slaughtered, it is of the highest importance that a game refuge such as is provided by this bill should be established. It is important, however, that proper provision should be made for the prosecution of offenders, for it must be remembered that owing to the failure to prescribe due form of law for dealing with violators of the regulations of the Secretary of the Interior, game slaughter in the Yellowstone National Park continued for more than twenty

years after its establishment. Slackness by Congress resulted in the practical extinction of the Yellowstone Park herd of buffalo, and the memory of that carelessness should insure the utmost care in the final shaping of the Elk National Park measure.

There is probably not time during the present session of Congress for favorable action to be taken on the bill to establish the Elk National Park, but it is believed that during the coming winter there will be no difficulty in securing the passage of the measure, provided the sentiment of sportsmen and nature lovers generally throughout the country shall give it the proper support. The project should receive the enthusiastic backing of all residents of the Pacific Coast, and it can hardly be doubted that throughout the whole country those persons who are familiar with what has been accomplished in the preservation of game and of natural wonders in the Yellowstone Park will be warmly in favor of a similar reservation which shall include a part of the wonderful Olympic Range.

### NEWFOUNDLAND CARIBOU SLAUGHTER.

FOR years we have heard of the movements of the Newfoundland caribou as paralleling—over a small area—the enormous migrations of the barren ground deer. So numerous were they, so well established the time of their journeys, and so well known their routes, that it has been the custom for those desiring to kill them to camp on the roads which they have always followed and to slaughter the animals as they walked or swam within rifle shot. Much of this hunting, so called, was anything but hunting, and could take place only during such a migratory movement. It resembles more the battues held on certain estates on the Continent of Europe, where hundreds of beaters, passing through the forests and the fields, drove out the birds and animals abiding there, and herded them by some stand, where Emperor, or Prince, or Duke fired gun after gun at the game as it moved along. The slaughter of hundreds, or of thousands of head of game in such a case depends merely on the endurance of the men who hold the gun to the shoulder and pull the trigger.

The inhabitants of many parts of the coast of Newfoundland are deplorably poor and often suffer severely for food. Fish constitute their chief food supply, and all the flesh food they obtain is furnished by caribou and seals. It is but reasonable that people so poor should be allowed a certain latitude in the killing of the deer which annually visit them, but such killing, of course, should be regulated by laws properly enforced, which should limit the destruction to somewhat less than the annual increase of the herd. In the case reported, the animals do not appear to have been killed for food but merely for the pleasure of butchering. The destruction was in defiance of law, and the carcasses were left to rot where they fell.

In Newfoundland, as elsewhere, the winter has been a hard one. Near the south coast, the caribou, driven from the woods by stress of weather, have come out in thousands. They feed in the open like cattle in a pasture and may be killed by hundreds or thousands. The reported destruction, if half true, shows to what a pitch of savagery men may be roused by the sight of game. Yet these Newfoundlanders, in this respect, are no worse than other people who have had much better education and training. Thirty years ago, in buffalo days, one might sometimes see an exhibition of similar savagery on the part of well dressed men and women, who from the car window would shoot with pistols at a herd of buffalo, lumbering alongside of the moving train.

The Newfoundland incident has been brought to the notice of Sir Cavendish Boyle, the Governor of the Province, himself a keen sportsman, and also to the notice of the Government, now in session. Stringent measures should be taken to prevent a recurrence of the wholesale slaughter of caribou, not alone on the ground that it is cruel and wasteful, but for the good of the province and its people. It has recently become more or less the fashion for Americans to go to Newfoundland to take salmon and kill caribou, and each one who goes there brings into the country a certain amount of money and trade. Much of this money is distributed among poor people, where it is of very great use. If the caribou disappear a good share of the foreign sportsmen will cease to visit Newfoundland, to the very serious loss of many people whom they now employ.

# THE SPORTSMAN TOURIST

## Floating Down the Mississippi.

### XX.—Reelfoot Lake—Part Two.

FEW regions offered such hunting as Reelfoot Lake in old times. The dead stubs of the drowned trees were filled with the nests of various wild fowl and countless swarms of bees. Pigeons flocked to the nearby hills for oak and beech mast. Crockett, in spite of his efforts, had not killed all the bears or deer "using" in the moist brakes. Muskrats, mink, otter and beaver were countless. And the migrant fowls!

Swan Basin got its name, tradition says, because, when the nights were cold, these magnificent birds would fly round and round it, "dragging their feet in the water, and so keeping it from freezing," though the rest of the lake congealed. It's nearly twenty years since the last swans came to Reelfoot, but one looks at the lake and thinks it fitting they should be gone, that the ducks and wild geese should come there in numbers that decrease year by year, that the bees should not be as thick as they used to be, that the swarms of wood ducks should not show the thinning of market hunters' guns, and that men should war in the courts for the privilege of buying the fish and game taken from these remarkable waters and shores.

Living forests are desolate to some people, the sea heaving and rolling "moans" in the ears of many, the wind "wails" through the pines, and the wide Mississippi is said to have "desolate" shores. It is not often, however, that nature displays her dead in gaunt nakedness. Let a tree fall in the forest and soon the leaves bank up against it, sweet green moss veils the crumbling bark, though one knows the worms are boring and the rot disintegrating, the thin covering of life hides the cold horror beneath. Not so at Reelfoot and other lakes of the Sunk Lands. Here nature, in one of her most terrible moods, with fire-quakes from the Isthmus, and water from the skies—by means of her two greatest forces—has laid her dead entirely bare.

The trees drowned, and such ones as oak, beech, pecan, gum and the like, quickly rotted and fell into the water, but the cypress did not rot. The wind broke away its dry branches, and the lightning split its trunks, but they did not often rot. It was only at the water line that nature showed her intention of ever doing away with the standing trunks.

As in most bottom lands of the South, the water in Reelfoot varies its level as much as 25 feet according, more or less, with the Mississippi. At low water, or within two or three feet of it, one can see that these dead stubs are being worn away where the waves, big and little, have lapped-lapped; for in the process of wetting and drying, tiny splinters are loosened, and finally struck away, and in this fashion tree trunks up to four or five feet in diameter are cut through and allowed to fall to

things are now, it is not so. The American lotus, its blossoms 10 inches in diameter, grows there by the acre. There are numerous other marsh flowers.

One may go around the borders of the lake and almost rid himself of the graveyard feeling, so long as he merely looks at the flowers, or, in the autumn, at the hues and shades of the ripened leaves. I found the autumn colors most beautiful there.

They were not so rich in tone as those of an Adirondack ridge, were less vivid; in fact, the red was a rustier red; the yellow a less pure hue, but still lovely. In the late afternoon the soft level lines of sunset darting through the tree tops, some large leaved, some the cypress haze, made one forget all else. But at the moment of utmost beauty, so it seemed, that piercing chill, which is not wind, but like it, came thrusting along, and in a moment all these beauties, these wonderful colors, become just the ornaments of open sepulchres.

In the '30s a man named Stone established a ferry about ten miles south of Tiptonville, in order to carry the dwellers on the ridge across to the Obion county seat, which was Troy. Harris later succeeded in getting Lake county formed, with Tiptonville the court house.

DEAD FOREST, REELFOOT LAKE.

Where the old ferry ran is now dry most of the time in many places. Stone "was something of a fighter," and when one Mitchell moved into the region and disputed with Stone successfully in a fight, Stone, at night, through a window, avenged himself by shooting Mitchell. It was "the first tragedy, or killing, that occurred west of Reelfoot Lake, in what is now Lake county." Stone was sentenced for life to prison, a notable fact in a region where murderers are these days fined for carrying revolvers, contrary to law. The administrator of Mitchell's estate found, among the papers, his own pocket-book of which he had been robbed while at New Orleans with Mitchell to sell a flat-boat load of hogs.

From this it may be gathered that the early history of the region, as regards its dwellers, was of a watch-dog-and-shotgun character. Just after the war times were particularly so, for guerrillas had not yet settled their differences, and, as Tennessee was divided in sentiment, lawlessness was long in passing. During this period one man left the country, owing to certain indictments in regard to a distillery, it is said. He had a government license to sell whiskey, but the fishermen and others say more whiskey was rolled in barrels into the lake than the license allowed. It cost him thousands of dollars to settle. Hence one great source of traditions. There were also some illicit stills and the revenue officers down to five or ten years ago had plenty to do among the islands which are in Reelfoot Lake. The old timer says he has seen good whiskey sold at ten cents a quart, and rubs his nose reflectively over the chemical compounds which individuals now import for personal use, owing to the law forbidding minor towns to have saloons or to sell whiskey.

Over fifty years ago there was a man named Thompson who lived in a cabin on a raft, making his living somewhat by fishing and more by keeping Thompson's Ferry across the Lake. One day Thompson sent word to the father of the present Lockey Donaldson to come down fishing. Donaldson went. Thompson's raft was about 20 by 40 feet, and under the shack he had a hole cut 2 or 3 feet square. The two men sat by the hole near the fireplace, lighted and warmed by its blaze, and sat and fished. They were over a great school of fish and, in the course of a few hours, had a pile of them nearly 4 feet high. The fish were "croppie," or "speckled perch," and this was their first appearance in Reelfoot waters. They had come in through the canal just then opened between Lake Michigan and the Illinois River. Lake fish are now caught in most varieties, occasionally, throughout the length of the Mississippi.

They have some stories about game as it used to be on the lake. "Many a duck I've shot from one of them old drift piles," the hunter says. Some say more than this, and the curious part of the yarns is, that the notebook maker sometimes hears pretty stiff stories, which, from various corroborative things heard, are true, though told as one of so-and-so's big lies.

For instance, in the Memphis Cotton Gin, at Tiptonville, one night, a hunter told of Old Isaac Newton's telling about shooting a duck so high up in the air that when it hit the water it burst its gizzard out. The hunter thought it was a pretty steep yarn, and yet an old timer, a few hours later, told of the swan shooting on the lake, "The birds were so fat they busted open when they hit the ice," things quite within the experience of many salt-water gunners, I am sure, from stories I've read in the FOREST AND STREAM. Again, Old Isaac caught out in the brakes one right cold night, crawled into a hollow log, after building a fire at each end of it. Quite ridiculous it seemed to some hunters at the gin—and yet men in Tennessee once lived for a couple of years in a hollow stump, according to history.

One time Old Isaac had a visitor who asked if bees were not plenty around the lake.

"Lots of them!" the old man said, "Can line a tree any time I want to!"

"So? I'd like to see it done." The old man took a plate of honey and set it on a log near his shack, and soon a bee was at it, wiggling its hind legs. Loaded, it raised in the air, and after a couple of circles, started out over the lake, above the gray stubs.

"See it!" Newton said, "See it! there it goes! Now watch it; hit's settling—thar! right in that cypress on yon side of the lake—three-quarters of a mile away. Want to go get it now?" the old man asked his visitor, who, somewhat dubious, said "Yes."

They crossed the lake, and in a cypress stub found a swarm. Wonderful eyesight, that old man must have had to see a bee that far; but, as a matter of fact, he had located the tree a couple of days before. The old timers were not above imposing on the visitor's credulity any more than they are now.

Lake county is between Reelfoot Lake and the Mississippi River—one of the extreme western counties of Tennessee, bordered on the north by Kentucky. The people of Lake county used to belong to Obion county, but the wide marsh and lake led to the formation of a new court house, in order that the citizens could get at their lawyers quicker and the sheriff be handier and clerk nearer. In his day James C. Harris was Lake county—the man who impressed his personality on it in a most powerful manner.

One hears of old man Harris on all sides. He was a much-blamed man. He did this, he did that—he looked cut for No. 1.

Whatever Harris may have been, he at length became

STUBS, REELFOOT LAKE.

the water, where they float till waterlogged and then sink, at least out of sight.

Reelfoot is a lake where one cannot row without getting hung up on the stubs of trees which have already been worn off in the fashion mentioned. But, in spite of these stubs, the wind raises great waves, and there are storms so severe that boats cannot ride them. In this bonéyard of a forest boats are swamped by coming down and overturning on the fragments. The man who essays to swim, his feet hitting stubs of one height, his knees those of another, while his breast comes down on the jagged tops—protuberances of only an inch or so long on the stump, and hard enough to bore a hole through wood, if it has a chance to catch a boat swinging—is soon done for. Many and various are Reelfoot's dead.

If its distances were less, or its waters musty, Reelfoot would be merely a gloomy, miasmic mud hole; but, as

LIVING TREES, REELFOOT LAKE.

a useful citizen. He got Lake county separated from Obion, and proceeded to agitate such projects as railroads, a levee and a drainage canal. He had grown rich, and his land holdings increased yearly. The time came when he put 5,000 acres of land to cotton in one year, as an experiment, not renting the 100 acre or so plots out as hitherto. In business he was implacable; all that was coming he got. Few men in Lake county escaped him. With his own eyes he guarded all corners of his holdings, and if he had a claim on anything he exhausted all methods to make that claim good—"he would law a man to death." Sometimes the blow fell hard on less able men—one comes inevitably to the conclusion that "mine!" was the word the old man wished most to say; and if being said, he reached further for more. But when he had it he spent freely enough in some directions, in "enterprises." Moreover, he stood by the men with whom

he had been associated during the days when traditions were made. One at least of these he cared for till the man died.

In one respect old man Harris had an advantage over his opponents. Day or night, blow hot or cold, if a thing needed to be done, or could be done, away he went. He led his surveyors into the mud, the top of which was frozen, and to which there was no bottom. He plunged through with his eyes open for the old corners, or making for the new. Over roads in which the wheels of a buggy sank till the axles were out of sight, and water now and then splashing over the sides of the box, old Harris would go to attend his "business engagements." Perhaps the necessity of having to keep such a date with him has left a rankle or two among the associates of the old man.

About five years ago some sportsmen who had enjoyed duck hunting on Reelfoot Lake, and noted that indiscriminate hunting was thinning the countless flocks of wild fowl till they were becoming countable, considered the possibility of making a private preserve of the lake to shut out the crowd which all winter long sought the Reelfoot game. Also, they contemplated reducing the fishing on the lake to less devastating proportions. Chess Smith, of Louisville, Ky., organized the Louisville Outing Club, which began to buy on the lake the claims of the various claimants. They spent about \$5,000 in all, and to the various owners of the lake offered stock in the club and money. There were some who refused, and then the club consulted some smart lawyers to see if they couldn't force the lake into privacy from the claims already in their possession. The result was that the club gave up, sold out, to old man Harris, who paid, it is said, \$5,100, or \$100 more than the club had expended. Thereafter the story of the lake became that of Harris as well. The man who "lawed everybody to death" began with a scheme: "I'm going to drain the lake," he said, "and I'll make good cotton lands of some of my swamps." His opponents claim that he boasted he had only a few poor fishermen to fight, anyhow.

He went to work. He put a gang of men ditching, and then it was up to the fishermen to save their livings. They had to attack, and they did it, pledging 10 per cent. of their incomes to pay the lawyers. It began in the circuit court. A temporary injunction was issued, and the lean gray man came into court, his eyes ominous. It was the old story of the courts—with money a plenty, witnesses by the dozen, old records accumulated and new ones contrived—a hard-fought, long-drawn battle, hinging on whether Harris had the right to make private cotton fields out of what had been always regarded as a public fishing and hunting ground. Harris was enjoined and the Supreme Court of Tennessee made the injunction permanent—Reelfoot Lake cannot be drained.

Harris found his titles defective. He did not have all the riparian rights. Those old surveys which showed certain claims bordered out in the overflow did not allow him to uncover those claims without the consent of the owners. The fishermen had rights to their living, more or less defined. But the fact remains: it was a permanent injunction that stopped the ditching. It is claimed for the Harris estate now that the old man's idea was not to completely drain the lake, but to take away four feet of the height by making a large canal, with a gate in it which, when the floods of spring came, would permit the lake to be drawn down to its summer level, or low water, in time for crops to be put in on the thousands of acres which are now given to cane and cypress brakes, "useless to any one for anything."

"There are about 28,000 acres in the lake," Judge Harris—his name is "Judge"—told me, "and of these 14,000 or 15,000 acres could be drained off in time to put in crops."

The opposition says that to drain off this land would leave a mud hole instead of a lake, and would make a miasmic swamp that would make Lake county chills much more famous than they are at present. The large water at present "purifies itself." Less water would "become stagnant." However, the permanent injunction settled the question of drainage. It didn't prevent some things, however. It did not settle the ownership; in fact, the decision, by reference to the rights of others, seems to have implied an ownership. These rights Harris continued to acquire as fast as possible. It was possible to make claims in the middle of the lake. These claims were made when the Louisville club began to show that such claims might be worth something. It is said these claims lie four or five deep all over the lake—Smith's, Jones', and Brown's on both of them, the corners mixed and without regularity. Apparently an inextricable mess was formed. But under all was Col. Daugherty's claim.

Daugherty was a soldier of the Revolutionary War. His claim antedated the New Madrid earthquakes, and what happened after the lake was formed is still to be decided by the courts. Did Daugherty's claim lapse and the land become public once more, or did it continue to be Daugherty's and that of his heirs? The Daugherty claim had no taxes paid on it; it took years to find the heirs, but when they were found, Judge Harris, his father having died, bought their claim.

Things were happening on the lake which promised trouble. Harris, with his pile of claims to back him, demanded that the fishermen acknowledge his right to the lake, as a piece of property.

One of the men who fought Harris in the courts to prevent the drainage of the lake, and was the leader in the opposition, was J. C. Burdick. For thirty years he had bought game and fish taken on Reelfoot Lake by pot-hunters and market fishermen. He saw his business taken away. The Harris claim gave another phase to his business. He had rivals in the trade, some of them the men who had joined in to prevent draining the lake. It was announced one day that Burdick had leased the privilege of buying and selling all the game and fish taken in Reelfoot Lake, paying J. C. Harris \$1,500 a year therefor. He had a three-year lease, but it is said Harris wanted him to take a year lease, and continue it from year to year, as Harris saw fit.

The terms of the lease are not understood outside of the interested parties, but it is said that Harris agreed to stand all the expenses of any litigation that might result from the exclusion of buyers other than Burdick from the lake. It shook the opposition up a good deal to have Burdick go over to Harris that way, and such men as

Frank Sparks, an active co-worker of Burdick's against the plan to make Reelfoot Lake private, are not delicate in characterizing Burdick's action as traitorous.

However, it was a good business stroke on Burdick's part. The fish and game sold from Reelfoot Lake's 28,000 acres amounts to \$70,000 a year, and Burdick got more than half of it in a hurry, for the panic of the opposition drove many out of business. Then the Obion Fish Company was formed. John Shaw, Frank Sparks and a man named Pleasant comprised this company, and they went into business buying Reelfoot fish and game. Down came a temporary injunction on them—"The fish belong to me, and I have the right to delegate a buyer and seller thereof," said Harris. The fish company gave bonds, and Harris in turn had to give bonds in order to cover any loss incurred by them during the interval till the trial of the case. The bonds were for \$1,200 each. And then the fishermen were enjoined from selling to any one except Burdick. It was another process in the "lawing to death process" against which so much complaint is made by men who find litigation expensive and not within their means. To make good the loss to Burdick, in case he has the right, under the Harris lease, to exclusive control of Reelfoot's wild booty, some of the fishermen are still under bonds, some are not, the injunctions being dissolved.

Old Man Harris died last spring in St. Louis after an operation. He left his son, Judge, a most faithful young man, in charge of the estate. Of Judge it is said, "Wherever you see old man Harris you'd see Judge, holding an umbrella over his father's head to keep off the rain or sunshine—and it wa'n't a fancy umbrella either, but like enough torn clear to the top on one side, but they didn't care for that, law, no!"

Judge is a mild-looking, brown-eyed man, very active, with a fine manner and well-shaped head. "He's just the nicest man to meet you ever did see—but, in business, look out!"

Here, again, is a man looking after what he believes is his own. He collects his rents on the day, he keeps his appointments on the minute. He lays out his plans at night and next day sees that they are done. Saw mills, cotton gins, a bank, 12,000 acres of land under cultivation, the business of a great plantation and of a forest—44,000 acres in all—is under his control, and he controls it. Not that alone, but he's head of the Lake County Levee Commission, and knows that the levee will be built because he's there to see about it. That levee is a right interesting feature. It shows a man's readiness with expedients.

RAYMOND S. SPEARS.

## The San Blas Indians.

AMONG the hundreds of barbarous or semi-civilized tribes of tropical America it would be hard to find one which is characterized by more unique and distinctive features of interest than the San Blas Indians, sole inhabitants of that portion of the State of Panama commonly known as the San Blas Coast. Scattered over an area of land greater than that of Massachusetts, having a sea coast not less than one hundred and twenty miles in length, intersected by innumerable little rivers, bayous and promontories and fringed by an almost continuous line of keys, big and little, formed, one might almost imagine, to protect the coast from the ravages of the beautiful Caribbean Sea, they number probably not more than five thousand men, women and children all told.

Favored in many ways by a bountiful nature, beyond contiguous parts of the country, it is not to be wondered at that Columbus, cast upon this coast, not fifty miles east from Puerto Bello and scarcely eighty from Colon, the eastern terminus of the Panama Canal, though accustomed to the luxuriance and beauty of the tropics, should have named it "The Garden." Consumed by his vision

Blas and continues almost to New Caledonia, not far from the Gulf of Darien. Its external features to one traveling the coast in a canoe or small vessel, are of a remarkable beauty of which the eye never tires. The peculiar light green tints of the foliage give it a fresh and invigorating appearance, as though newly made and not yet seasoned. Numerous keys jut out from the mainland which in places slopes up gradually to meet the Andes Mountains and again rises heavily wooded from the sea to the height of hundreds of feet. One accustomed to our northern coast scenery is struck by the invisibility of the soil. There are no bare stretches of land, no projecting rocks, or wastes of sand, everything is clothed by nature with a profusion of growth and foliage, of which the most important is the cocoanut palm, the fruit of which is the revenue and coin of the country.

Owing to the distrust with which the natives regard strangers, there is but one way in which an American can

FIRST VISITORS TO THE SHIP.

get close enough to them to make any reliable observations, and that is by shipping aboard a cocoanut trader, the only kind of vessels that ply the coast. Two New York firms, with a score of vessels, sloops and barkentines, do the entire business and ship to this country almost fifteen million nuts per year, over one-quarter of the entire production of the tropics. It was while on one of these vessels that the photographs which accompany this article were taken.

The method of doing business with the Indians is a very simple one. In the employ of each cocoanut firm are some ten or a dozen traders, Colombians or half-breeds. These men, either in small sloops or Indian dugouts, with a crew of two or three Indians traverse the coast, each in an allotted territory, and contract for the nuts, which are collected and stored in certain places easy of access for the larger vessels, and in them loaded and brought to New York. The cost to the trader is a fixed one, twenty dollars a thousand, Colombian silver, about eight dollars American gold, or goods to the same amount, and two dollars export duty, which is the only revenue that the Colombian Government gets from the land. The

A SAN BLAS VILLAGE.

of discovering the priceless mines from which the gold of Solomon's temple was brought, of which there was no trace here, Columbus stayed but a few days on the coast and has given us but a meagre description of the natives and none of their pursuits and customs. Nor have the later discoverers been more explicit; the old records contain practically nothing but accounts of the presence or absence of gold and treasures.

It cannot be doubted that this lack of plunder was the only reason which caused the old adventurers to allow the people to live in peace, and it is most probable that the same reason has actuated Colombia in her later treatment of them.

Their land, by ancient grant, begins at the Gulf of San

price in New York varies, of course, with the imports, from twenty to forty dollars a thousand, so that the industry cannot be said to lack profit.

My acquaintance with the Indians began one afternoon, when about forty-eight hours out from Carthagena, where we had called for the customs agent, the Rhoda, a barkentine of about two hundred tons, dropped anchor a quarter of a mile off shore, just west of Cape Tiburon, at the eastern boundary of their land. Numerous dugouts, with one, two or three occupants, appeared putting out from shore. A pretty sight they made, as, with paddles flashing in the sunlight, each strove to be the first to reach the vessel. When alongside the occupants showed much reluctance about coming aboard, contenting them-

selves with paddling about and offering bananas, plantain and alligator pears for exchange. These three products of the soil, with the fish which they net and catch, form the chief subsistence of the Indians. On looking closely I found that most of those which had come out to visit us were boys, most of them little fellows not more than eight or nine years old and some of them evidently not more than five, and here they were paddling about in the open sea, in spite of the sharks which infest these waters, with a total disregard of possible mishaps. Curiosity overcame the distrust of one of them and enabled us to get a good photograph while he was trying to decide whether to stay and see what was going on or jump overboard. His name was Sammy, so the trader learned, and he speaks for himself.

Early the next morning we went ashore, taking along a trader to interpret, and saw the chief. He was a short man, not over five feet six inches, with close cut hair, high cheek bones, deep reddish skin and very square shoulders, a characteristic of the tribe. The general contour of his face suggested the Asiatic. His dress consisted of a pair of overalls, a white cotton shirt and a jaunty little yachting cap, made in Germany, the *tout ensemble* being rather original. There was no way of discovering by observation that the responsibility of the government of this particular key rested with him, as he wore no badge of office, his hut was not of unusual size, and there was nothing distinctive about him. The current phrase with them on meeting a stranger is *Ibi nuga*, which means "What's your name?" The interpreter gave ours and on asking the same question of the chief was told, "Henry Clay."

There are between forty and fifty of these chiefs, located on different of the larger keys along the coast, and probably eight or ten have American names, such as Henry Clay, Washington Harvey and George Washington. They receive no salary or remuneration of any kind for the responsibility of governing, and, it must be said, that owing to the ordinarily peaceful natures of the natives the chiefs' duties are not onerous. They are elected by popular acclamation and govern by the consent of those governed, with an absolute lack of safeguards, such as a constitution, or law, or police, and an efficiency of decency and order which puts our civilized countries, with their complicated machinery of legislation and justice, to the blush. When the natives become tired of or dissatisfied with any chief they request him to resign and he henceforth retires into obscurity. A few cases only have there been of a chief refusing to be shelved, all of them attended with disastrous results, they having no scruples about killing a chief or anybody else if he stands in the way of the accustomed order of things. Several have as a badge of office plain polished mahogany sticks about three feet long, but very little significance is attached to them.

The head chief, who lives at Sasardi, a few miles south of the Isle of Pines, which marked the nearest approach of Colombian troops to Colon during the recent imbroglio, is distinguished by a flag pole which flies no flag, and which constitutes the only external difference from the sub-chiefs. He is probably the most intelligent Indian on the coast, having been once to the United States when a young boy and to Bogota several times to treat with the Colombian Government. His sense of justice is well defined by his method of dissolving a cocoanut corner which the Indians, the whole length of the coast, had formed about five years ago. In their haste to get rich they unwisely put the price at \$40 a thousand, Colombian silver, an almost prohibitive figure. The traders refused to buy and for two months not a nut changed hands. Finally, the head chief summoned to him the youngest trader on the coast, a New Englander by birth, and as shrewd a man as could be met with, and said to him, "My friend, it has been told to me that while the other traders cursed and threatened my people for not selling our nuts, you, though losing much money every day through having men and vessels idle, said to my people, 'The price is too high. I will not buy. The nuts belong to you and my goods and money belong to me. Good, then keep your nuts and I will keep my goods.' That is fair dealing," continued the chief, "my people are ignorant but they admire truth. I give you the pick of my people's nuts at the former price." The young American bought practically the whole market and cleared over twelve thousand dollars by his appreciation of the Indian character, while the rival concern, believing in more high-handed methods of finance, were unable to buy a nut.

The language is most peculiar and very difficult to understand because of the use of the same words to express different meanings, and because the verb is not used. Thus their sentences are abrupt and disconnected, and the thought obscured, except to one of long acquaintance with their tongue. Without exaggeration, I should say that it is more difficult to master than any of the six languages most commonly spoken throughout the world to-day. It does not seem to have developed or enriched itself in any way by assimilation of words or phrases from other tongues, and may safely be said to be practically the same as it was long before Columbus ever saw the Western Hemisphere.

The same tendency of segregation is very noticeable in their marriage customs. Intercourse with other tribes or peoples is not indulged in or thought of, and thus their native intelligence, which at times betrays itself in astonishing ways, lies dormant for the lack of infusion of outside blood to quicken it to life. On coming to marriageable age the Indian maiden is kept in seclusion for a period of three days, attended by a number of the oldest women of the village, and her hair cropped close, in which fashion she wears it for the rest of her life. Marriage is a mere agreement between the man and woman, there being no attendant ceremony and no obligations except that they live together until death parts them and that the man support his wife's father. The mother-in-law is thus happily ignored, and it can hardly be doubted that in this manner one potent cause for the severance of the conjugal tie is removed. Divorce is, of course, unheard of, and separation most rare, and in cases where it does occur neither party is allowed to remarry before the death of one of them. If immoral intercourse should be perpetrated and discovered the head men in the community take matters into their own hands and the offenders when caught are put to death. And there can be no

question that the effect of this custom is morally most salutary and economically most judicious.

The women are a little shorter than the men and probably average in height about five feet two. They wear, for the most part, fancy short kimono-like gaudy yellow, black and red combinations, cut off at the elbows, a breech cloth, and blue jeans to the knees. On their legs from infancy are tightly wrapped above and below the calf bands of fancy native bead work, the result of which is to make the calf very prominent. For adornment they wear thin nose and ear rings about the size of an American half dollar, and about her neck the mistress of the house strings her lord's money, Chinese fashion. The Colombian dollar and half dollar are the only coins used on the coast, and the wealthiest woman we saw was wearing a string of probably two hundred of the latter.

The women are more carefully kept from the near view of strangers than is customary in Turkey, and it was only the greatest good fortune that enabled us to procure one of the photographs here shown. The lady here reproduced had never seen a camera and did not really know what was going on, as the photographer was screened by the overhanging eaves of a hut. They are not all so ignorant, however, as the experience of a trader whom we met attests. Being something of a collector, and hoping to get some pictures of the natives, he one day produced, while trading, a kodak, telling the Indians that it was a machine that made a fine cloth for their women. "No," replied an old chief in his own tongue, "you lie, that is a machine to take our women to New York." They refused to deal with this particular trader from that day on, and, needless to say, the traders attempted to take no more pictures.

Though they distrust the camera they actually fear the phonograph, which they think is the very devil himself, and they made such an impression on an agent who was sent down there by a New York concern that he did not look for any more customers until he had reached Cartagena, 200 miles away.

Their religion is crude; they believe in a God, but they neither specify his attributes nor accord him much power. He is an elusive deity, and is neither gratified by regular devotion or by altars, temples or any sort of sacrifice. Sunday is the same as any other day in San Blas. The deceased were once buried with all their property, but this custom has been dispensed with and they are now interred about ten miles up the rivers, in a sitting posture, and facing the east, with nothing to mark the spot. There is no weeping or period of mourning and the incident is forgotten as soon as possible.

The huts are built very simply, thatched over with palm leaves, so naturally that they appear to be a production of the soil, and so strongly as to weather the fiercest gales that sweep the coast. They consist generally of two rooms, one large, the sleeping apartment, and the other smaller, the kitchen. They use no couches or beds but sleep in single hammocks which the women weave from twine on hand looms, dye in variegated colors, and which are really works of art. A fine hammock will take an expert native six weeks to make and will last a lifetime.

The men are poor bush hunters, but excel in diving, swimming and handling their little canoes. In sailing their dugouts, which carry mainsail and jib, one man handles the sheet rope and rudder and another, standing on the gunwale, holds to a rope attached to the top of the mast and by leaning out from the side when a gust comes manages to preserve the balance of the craft, which are infinitely more cranky than the crankiest Adirondack canoe ever built. Thus they make good sailors, but seldom do they ship aboard any vessel which leaves the coast.

The country inland is almost a closed book, and practically nothing is known of the Indians who inhabit the mountains, a tribe of bushmen descended as the San Blas natives from the ancient Caribs, and of whom the former live in some dread. Fifteen miles up a couple of rivers in search for monkey and jaguar hunting is the furthest our party penetrated, for at about this distance from the ocean our guides invariably refused to proceed further.

In view of the deflection of the world's commerce to the Panama Canal, which seems assured, and which is at the very boundary of the land of those Indians, and the recent change of government of the department of Panama, in which the land wholly lies, it is a decidedly interesting speculation as to what will become of the unknown and unnoticed Indians. For centuries they have held their land, secured in peace, from the Government of Bogota and those which preceded it, always enjoying fair and generous treatment, exempt from taxation, and free from any sort of state burdens. By the events of a few short weeks they have been thrust unwittingly into a position where their friendship or hostility means much to both Panama and Colombia. Their land is the buffer between the two countries. In my opinion, everything tends to cause them to side with Colombia; she has been their friend, while Panama is the friend of the United States, whose people they distrust. There is no doubt that at the present time they are being exploited by emissaries from Bogota, in proof of which I would cite the attack made by the Indians on the United States gunboat *Rancroft* last January, which was repelled without damage to either side by the discharge of a few rounds from the machine guns over the heads of the natives.

Whichever way they turn the result, I think, will be the same. They lie between the devil and the deep sea. The land is the most fertile in the world. On account of the trade winds, which blow continuously, it is the most healthy in Central America. It has industries which could be pushed profitably, and its very contiguity to the canal places it in the path of civilization, which superimposed would be more destructive to the Indian than war.

The pages of history are filled with instances of like character, and while they may be considered the milestones which mark the advance of civilization to its ultimate triumph, they are none the less the tombstones of many a tribe and race conquered by the unequal contest with advanced conditions of life.

PHILIP LE BOUTILLIER.

NEW YORK CITY.

"This race problem is a dreadful thing." "Yes," answered young Mrs. Torkins; "whenever I see Charley get a pencil and begin to figure on the entries in a race, I know there's going to be trouble."—*Washington Star*.

## Natural History.

### Short Talks on Taxidermy.

#### How to Skin and Preserve a Bird or Mammal.

THERE are few things easier to do than to remove and properly preserve the skin of a small bird or mammal, and yet few that to the inexperienced person seem so difficult. Without direction, one knows not how to begin nor how to proceed, and the first efforts of the self-taught taxidermist are sure to prove discouraging failures.

I remember well my first attempt. The bird was a crow that I had shot from a window as it was flying over the house; it was the first bird that I had shot on the wing, and I wished to preserve it. As soon as I returned from school, I began to skin it, kept at the work until night, and after the evening meal, worked till bed time. By this time the skin was turned inside out, and fairly well cleaned, and in this condition I left it over night. After school next day I tried to turn it right side out, but the skin had dried and shrunk. I did not know enough to moisten it, so as to make it slip back, and in endeavoring to force the head back through the neck, to my great disappointment I split the skin, and was obliged to throw it away. Some similar experience has come to many a boy.

To become a good taxidermist, one who can mount birds and mammals in an artistic and life-like manner, requires a deep love for nature, implying close observation and careful study, together with love for art, and much practice. Taxidermy, though considered a mechanical trade, is much more than that. It is a department of art, and is closely akin to sculpture. To attain the highest degree of excellence one must devote his life to it, and by study and work, through discouragements and failures he may at last attain eminence.

On the other hand, a little instruction and a little practice will enable any one to attain a fair degree of skill in preserving skins, which may be useful either for study or to be mounted in a collection. Nothing is more common than for the gunner to shoot some game or other bird with which he is unacquainted, and about which he is curious. He would like to save it, so as to submit it to some expert ornithologist, who can tell him what it is and something of its manners of life. If a rare bird it may have a certain scientific value, or, at least, have sufficient interest to be a desirable addition to some collection. If the gunner understands how to remove and preserve the skin he is in a position at least to satisfy his own curiosity, and possibly to perform a useful service to science. No month passes without the record in some ornithological periodical of the capture of certain birds in localities where, according to the experience of previous ornithological collectors, they have no business to occur. But, no doubt, every year hundreds of birds are killed whose occurrences ought to be recorded, but, through the ignorance of those who shoot them, fail of such record.

To say nothing of the gunners who like to possess a collection of game birds, representing all the species that they have killed, there are many young men and boys interested in natural history who wish to acquaint themselves with the birds and the mammals found in the localities where they reside. Such study of the local fauna is useful and profitable, provided it is intelligently undertaken, and under proper direction. But it is very wrong—hardly less than criminal—to make a collection of birds, or of mammals, from the mere desire to accumulate a great number of specimens. The practice once so common of making large collections of birds' skins solely for purposes of exchange, or from a desire to have a large collection, is frowned on by all good ornithologists and is forbidden by the law, which, in many States, provides that small birds shall not be killed except by some one who possesses a license to kill for scientific purposes only. Usually such a license is granted on the recommendation of one or more competent ornithologists, none of whom in these days is likely to lend his sanction to the granting of a license to a mere collector.

In this, and the succeeding articles, I shall describe very briefly a common method of preparing the skins of birds and small mammals. There are a number of excellent works on this subject, but several of them leave much to be desired in the matter of detail.

Small birds and mammals are commonly obtained either by shooting or trapping. The birds are usually taken with a shotgun, while mammals are more commonly caught in traps of various descriptions, and these traps usually kill the animal at once.

Game birds and larger birds are killed in ways that are familiar to us all. Smaller birds are commonly taken with a shotgun, loaded with very light charges of powder, and of the smallest shot, usually dust shot, or No. 12. Often, however, for collecting the smallest birds, where the shot frequently has to be fired at a distance of only a few yards, the ordinary .12-gauge shotgun is too large, for it cannot be so lightly loaded that it will not cut the bird to pieces badly at very close range. For the collector, then, several devices have been invented, one of which is a shell fitting the chamber of an ordinary gun, and with extremely thick walls, and a small opening through it about the size of a .32-caliber rifle. Into the base of this shell, or auxiliary barrel may be slipped a small cartridge, lightly charged with powder and shot, and exploded by the firing pin of the gun. The length of the useable barrel for this small shell is less than three inches, but this small shell is used only for small birds, at a distance of four or five yards.

Another gun is described by Mr. C. J. Maynard, in his *Manual of Taxidermy*, as follows: "This gun consists of two brass tubes, a smaller one within the larger, with an air space between them, thus greatly deadening the sound, and both are securely fastened to a finely nickel-plated, five-shot revolver. We make two sizes, a .22-gauge, the report of which is very slight, and a .32-gauge, which makes a little louder noise. The former will kill warblers at fifteen yards, and the latter at twenty yards, while birds like jays, thrushes and robins

may be brought down with a .32-gauge at a distance of ten yards."

Provided with an arm such as has been indicated, and with a few ordinary shells in his pocket, for larger specimens, or for birds at a considerable distance, the young collector may safely enough start out to secure his specimen. But he must provide himself with a few other things, in order that he may bring in the birds that he kills in satisfying shape. In a fishing basket, which he will carry on his back, he should have an old newspaper or two, a little bunch of cotton, and a tight box, containing a little plaster of paris, to stop the bleeding in a bird that may be badly shot. From a piece of the newspaper he will, when he secures a bird, make a cone, into which the bird should be slipped, head first, and then, turning in the open end of the cone, the feathers will be kept smooth and clean until he returns to the house and put the specimen away. It is often convenient to have in the basket a pair of small forceps, which may be useful in several ways before the day is over.

If the student is a beginner, and desires only a specimen or two for practice, he will do well to try his hand first on a bird the size of a blackbird or a bluejay. Let him kill two such birds, if the opportunity offers, and then return to the house and begin his work.

As soon as the bird has fallen it should be picked up. If, by any chance, it is not yet dead, an instant end should be put to its sufferings, by taking it in the right hand, placing the forefinger in the fork of the breast bone immediately below the neck, the thumb and second finger being against the bird's side, just back of the wings and above the breast, and then compressing the body. This causes instant death by suffocation, and is as painless as possible.

If there is no sign of blood on the plumage, or from the mouth or nostrils, open the bird's mouth, and with a small twig, or a match, push a little wad of cotton into the mouth and a little way down the throat, gathering it up, so that none of it projects from the side of the bill, and close the bill, and see that it remains closed. The wad of cotton should be large enough to comfortably fill the throat, and so to prevent the passage of any blood or juices that otherwise might come from the gullet, or the lungs. If the bird should be bleeding at the nostrils, these should be plugged with cotton, which may easily be thrust into them by the fine point of a twig, or a match whittled down small enough to enter the nostrils. If anywhere on the plumage there should be a clot of blood it must be removed by the blade of a penknife, moved with the grain of the feathers, and the feathers then be lifted up, and the shot-hole dusted with sufficient plaster of paris to

TOOLS USED.

absorb the flowing blood, and, as it hardens, to stop that flow. Some of the books recommend the plugging of these wounds with cotton, and if it is properly done this is very well, but too often the cotton fails to completely fill the orifice, and the blood continues to leak out, and to spread among the feathers. A dab of plaster, on the other hand, is usually quite effectual, and after the skin has been removed can be broken up and removed from the feathers.

If by mischance a pellet or two of shot should have struck the bird in the eye, the moisture from the eye is likely to leak out and wet the feathers of the head and neck. This may well enough cause trouble when the time comes for removing the skin, and I have frequently, in such a case, carefully introduced the points of the forceps between the eyelids, and removed the whole eye, taking up any moisture that might appear by means of plaster of paris, with which the orbit can easily be dried. This is something, however, that is not likely to happen.

When the bird has been so prepared that no blood or other moisture will injure it during the excursion, make your cone of paper, as already advised, and having done up the bird, lay it away in the bottom of the fishing basket, with the paper, cotton and other things, above it.

Before this you will have provided the necessary tools for your work. These should be two or three sharp scalpels, such as are used by doctors in dissecting, a pair of scissors of medium size, two pairs of forceps, one small and the other somewhat longer, and a short pair of flat-pointed carpenter's pliers. For most purposes a really sharp penknife will do about as well as the scalpels, but the latter are somewhat more convenient. One can use either tool, swiftly and satisfactorily, when accustomed to it. Besides this, a tin box, with a tight-fitting cover, should hold a pound or two of arsenic, and in this box should be a brush for dusting the poison on the skin. A wad of cotton, tied about the end of a stick, or, what is still better, the foot of

a hare, lashed by half a dozen turns of fine wire to the end of a stick, makes a convenient implement for the purpose. All these articles should be together in the room, and on the table where you are to do your skinning. For this work you should have a special place; the cellar, or some corner in the barn or in an outhouse, where it is warm in cold weather. It is better not to do the skinning in your bedroom, nor at random all about the house, as the fragments of flesh and the bird bodies, which you will have to throw away, are not agreeable objects for the housekeeper—and perhaps not for any one—to see. Moreover, your poison should be kept where no one can get at it. It is better to have all these things under lock and key, if possible.

If you collect bird skins or those of mammals, you will need a case in which to keep them. Such a case, economical in the matter of room, and convenient, because it keeps the skins from pressure, and so from getting out of shape, may be made by having constructed a box, two feet long, eighteen inches wide, and twenty inches high, into which shall fit, one over the other, a series of wooden trays—of the lightest possible stuff, the bottoms even being of pasteboard—the deepest two and one-half inches in depth, and from that running down to an inch in depth. The box opens at the top with a lid, hinged behind, and furnished with a lock. The trays are to hold your skins, those of the smaller birds going into the shallower trays, and the larger ones being placed in the deeper ones. The deepest tray of all may, for a time, at least, serve to hold your stuffing tools and your poison. Such a box should be light, but strongly constructed, with all the joints absolutely tight, and with the lid tight fitting, so as to keep out insects.

AMATEUR.

## Bear Ways and Other Things.

Editor *Forest and Stream*:

Mr. Hardy is right about bear retaining their fat all winter. I have killed bear at all times of the year, and always made a post-mortem examination. About a month or so before a bear dens up, the stomach begins to contract, and by the time a bear is ready to den the stomach is contracted until it looks like a chicken gizzard, and it and the intestines are clean and empty, and the bear is a mass of fat, inside and out. After the cubs are born a female gradually loses her fat, and is rather poor by the time she comes out. But the males and barren females seem just as fat when they come out as when they denned, and carry their fat for some time afterward. I have killed very fat bears at least two months after they had come out in the spring. Most bears seem to eat very little, and to carry this fat until vegetation gets a good start and they get green food; after that they lose fat very rapidly. This applies more especially to bear that live in a snow country.

Here in the West the lowland bear den up only during the coldest weather, do not put on much fat in the fall, and lose it early in the spring. In the mountains bear den up with the first heavy snow—generally in November or December—and stay in until March or April. But a warm spell during the winter will always bring out the bear, though they will not go far from their dens. Most of the bear dens I have seen were holes dug out on a north hill in heavy timber where snow would be deep, but I have also found bear in caves and under windfalls. Hollow logs large enough are scarce out here.

As regards bear killing game I do not think that they destroy much. A bear is omnivorous, and if he comes across a young animal asleep takes it in, but he would be just as well satisfied if it were anything else edible.

I have found remains of the young of elk and deer that had been killed by bear, but not many, and never found a large game animal that I was sure had been killed by bear. Still, some bear will kill cattle, and would no doubt kill big game if they had a chance. All the young game animals I know of that were killed by bear were small ones that the mother had left and the bear had stumbled on, and I do not think that bear make a practice of hunting game. But a bear picks up all the eggs of ground-nesting birds that he finds.

Anything in the animal or vegetable line that is edible is bear food, so bruin has no trouble in keeping a full stomach, and does not have to hunt like a wolf or cougar. One of these last will, in a game or stock country, kill every three or four days.

What Mr. Hardy says about what the majority of people believe about bear losing their fat brings to my mind the lack of close observation among those who pose as authorities on natural history, and from whom most people get their ideas.

One writer, in speaking of chasing a bunch of wild horses, speaks of a snow-white mare that was easily seen at night, and made it possible to follow it constantly. It is very evident that this writer had never night wrangled horses, or he would have known that it is almost impossible to see a white horse at night, and that a black or bay can be seen three or four times as far. As a matter of fact, against any background but black or green a white animal is harder to see in daylight than a dark colored one. This same writer works up a harrowing story about being caught by the hand in a wolf trap, when, if he had placed a foot on each spring and pulled upon the trap with both hands he would have been loosed at once. A man caught by the hand in any trap but a No. 6, 42-pound bear trap can get loose, and I have seen men open and set a No. 6 in this way, but of course they were very strong.

By the way, can a grizzly bear cub climb a tree? This writer says that they can, and that as they grow older their wrists get stiff and they cannot climb. Now, I always thought that a grizzly cannot climb because the claws of his fore feet are too straight to get hold on a tree. I never saw a grizzly cub climb. Once we had a grizzly and a cinnamon cub in camp at the same time. They were about four months old and used to have great tussels with the dogs. When the cinnamon got the worst of it he always took to a tree, but the grizzly never treed, but would back up against something and knock out every dog that came near. And though the cinnamon was up a tree half the time, either to get away from the dog or for the fun of

climbing, the grizzly never attempted to climb.

I have several times come on a she bear and cubs and could almost always chase a black or cinnamon cub up a tree, but could never make a grizzly cub take a tree under any circumstances.

Many of the writers on outdoor life seem to write a whole lot by guess anyway. One has some of his characters traveling when it is so cold that they can't stop to tie a shoe-lace without beginning to freeze, and in the next breath has them spending hours up trees waiting for stray Indians to pass underneath. Maybe they built a fire among the branches.

This same writer speaks of an Indian sewing the shapeless bag of bark which was afterward to become a canoe and of making deadfall traps at camp out of wood and rawhide. He also speaks of boiling deer brains and using the liquor to remove the hair from deer skins. It is many years since I saw a birch, but when I was a boy the frame of a canoe was made first and the bark put on afterward, piece by piece.

Deadfall traps are made right where they are set, and no rawhide used. And all the Indians I ever saw tanning used the brains to rub into the hide after the hair and grain had been removed. Buckskin can be made with nothing but water and elbow grease.

Take a deer skin and soak it in water until the hair starts, then take off the hair and grain with any kind of a blunt knife. Then wash the skin in water until the glue is all out, work it dry, and you have buckskin. But it will dry hard every time it gets wet. Rubbing in brains, or any fat, for that matter, is simply a filling, like oil in leather.

I note that at a late meeting of the Campfire Club the old, old yarn was sprung about a cougar sucking the blood of its prey.

Now, I have examined hundreds of carcasses of animals killed by cougars and never saw any indication of blood sucking. A cougar nearly always kills by biting the back of the neck, and it mauls its prey just as a cat does a mouse. I never had the luck to see a cougar make a kill, but a friend of mine once saw a cougar catch a doe. He said that the cougar landed on the doe's back, smashing it to the ground, and commenced chewing its neck and shoulders. The doe thrashed around, bawling and making an awful racket, and my friend ran up and shot the cougar. The doe was too badly hurt to live, so he had to kill her also.

It is quite common to find horses that have been attacked by cougar and escaped, and the claw and teeth marks will always be on the sides and back.

If people will set themselves as authority, for heaven's sake let them study their subjects.

WM. WELLS.

WELLS, Wyoming.

## What is the Egg?

A friend gave me a bird's egg this morning that was found on the ground in a pasture lot; there was no nest.

In size it is .76x.99 of an inch, about midway between a Wilson and wood thrush egg. The color is the light blue of the bluebird's egg. On emptying it I found it perfectly fresh, and it must have been dropped the day it was found, Monday, April 18, for on Saturday morning there was nearly a foot of snow on the ground, most of which remained until Monday. On Saturday and Sunday mornings the thermometer was at 20 degrees above zero.

We have had no birds breeding here in April whose eggs are of the size and color as the one found; and as yet but a few migratory species have been seen. I can name only the bronze grackle, redwing, bluebird, robin and song sparrow, up to this morning, when I saw the first brown creeper.

I went out two weeks ago to-day to look for snipe and saw no signs of them. Have heard only of two being taken, and they were taken near Buffalo. We had four inches of snow yesterday morning. I saw it being carted off Main street this morning, and there is plenty to be seen from my window as I write this.

J. L. DAVISON.

LOCKPORT, April 20.

## Crows in Town.

HORNELLVILLE, N. Y., April 18.—*Editor Forest and Stream*: I have always been interested in birds, but until last Friday, the 15th, I never saw crows act like turkey buzzards. On that day I saw, from 9 A. M. until noon, between twenty and thirty crows right in the center of the city, some in trees, some along Canadea Creek, some in the park, others in lots and back yards.

I suppose they had just come north, were very hungry; finding fields frozen and no grub or grubs, they came into the city for something to eat. A crow is shy, and I think they must have been very hungry.

That night we had a blizzard, seven inches of snow and good sleighing the 16th.

J. OTIS FELLOWS.

## Is it a Flicker?

*Editor Forest and Stream*:

In reply to "F. M.," whose question, "What bird is this," appears in your issue of April 23, I would say that to the best of my knowledge it is a flicker, also called a highhole. The flicker makes a sound such as the one he describes, and is a large bird, showing, as he flies away from you, a large white spot on his back.

C. L. A.

ENGLEWOOD, N. J., April 20.

PHILADELPHIA, April 23.—*Editor Forest and Stream*: What bird is this? Query from F. M. in last issue. Answer: Flicker or highholder. I am afraid F. M. lacks the advantages of having been born in the country. Hope they will become better acquainted.

E.

SPRING fashions for Parisian dogs include many novelties, such as colored cambric night shirts, rubber shoes, thick, fluffy dressing gowns to wear after a bath, straw and felt hats, special wicker sofas, cushioned and be- decked with garlands and ribbons; nail files, ear picks, powder boxes and vaporizers.

At the dogs' dressmakers' in the Palais Royal I noticed this week a white, hairy cloth overcoat, bordered with white mohair galons, a red velvet collar and a pocket for the handkerchief.—*New York Herald*.

## Accidental Shooting in the Woods

HON. J. F. SPRAGUE, of Monson, Maine, read the following paper before the North American Fish and Game Protective Association at its recent annual meeting, at Portland, Maine:

The accidental shooting of men by hunters for big game, not only in the Maine woods, but in other forest sections of the country where game is pursued is deplorable alike to sportsmen and all good citizens. Its frequent occurrence is lamentable, and if there is any remedy within the domain of law or otherwise, it should be discovered and applied. The subject is grewsome and each case has been a painful one, yet all of us have been interested in it and studied it for the finding of the cause. The circumstances surrounding each case have varied, yet it would seem that in about every instance the party committing the offense has been in more or less of an abnormal mental condition occasioned by unnatural excitement.

Sometimes the victim himself has unwittingly been at fault in placing himself in a dangerous position, contrary to the arranged plans of the hunting party. My observation and information lead me to the conclusion that generally these accidents have been by novices. Old hunters, woodsmen, guides, and sportsmen of mature experience and long training in forest life have seldom made these disastrous mistakes.

Many have contended that those who have been instrumental in formulating and enacting the laws for the protection of the game have been derelict in this respect, and that more drastic measures should be passed—statutes that would impose severe penalties for shooting human beings by persons in pursuit of game and game birds. Along this line the Legislature of Maine in 1901 passed the following act: "Section 1. Whoever while on a hunting trip or in the pursuit of wild game or game birds, negligently or carelessly shoots or wounds or kills any human being, shall be punished by imprisonment not exceeding ten years, or by fine not exceeding one thousand dollars. Section 2. It shall be the duty of the County Attorney and Sheriff in the County in which a violation of the foregoing section occurs, to forthwith investigate and prosecute every person who therein violates the provisions of this act, and for failing to investigate and prosecute, each of said officers shall be liable to a fine of not exceeding one thousand dollars and to be removed from office." I am not aware that any marked change for the better has been the result of this law. It is a principle of the Common Law, that the killing of a human being through negligence, is manslaughter, and the penalty for it in this State has always been the same as provided by this act. Section 2 of this act made it incumbent upon the County Attorneys and Sheriffs to institute immediate investigations whenever such an accident occurred, which they have done so far as I am informed, and yet I do not know that a true bill has been found against any one by any Grand Jury in the State under this act. The killing to constitute manslaughter must be unlawful and malicious, but the malice may be presumed, if, as the Court says in *State vs. Knight*, "there is nothing in the circumstances, as proved to explain, qualify or palliate the act." Then "the law presumes it to have been done maliciously." Without considering, while passing, the complicated questions which might arise as to what would constitute negligence, it will be readily perceived that a prosecution of this kind would be beset with grave difficulties. It is doubtful if it is possible for any one to formulate a law aimed directly against accidental shooting that will reach to the root of the evil.

It is not within the range of possibility to punish a man for the purely accidental killing of a human being. If a legislature should, in a frenzy, pass such a law, it is not likely that it would stand in the Courts or ever be enforced by any Anglo-Saxon community. Then if there is no help for it within the ken of the law, is there any practical way for hunters and sportsmen themselves to substantially work out a solvent? I dare not be positive about any position regarding so intricate a subject, and yet this question may possibly be answered affirmatively. Philosophers, sages and scientists have from the beginning of the race searched for light within the realm of the mind, but have been rewarded with only the most meagre knowledge. We only know that the human mind is a complicated and mysterious piece of mechanism, constantly being insensibly influenced by occult forces, only some of which are discernible. Now we have for a long time had in Maine a heavy penalty for killing the cow moose. The moose hunter goes into the woods in quest of moose, knowing that he must stop and determine, before he fires, whether it is a bull, a cow, a spike horn, or a calf, and he pauses long enough to ascertain, and seldom mistakes a moose for a man. Why is this? I cannot satisfactorily answer the question, neither can you. We know only the fact. His mental processes must have unconsciously led him into a deliberateness in pursuing the moose, which he is a stranger to when hunting the deer. The normal man when he enters upon a chase

for either deer or moose is possessed of no idea whatever that he may kill a fellow being. Such a calamity is not consciously or unconsciously any part of the workings of his mind. The excitement of the chase is intense with him, especially if he is a beginner in the sport.

This undue and abnormal excitement subjects him to distorted visions, mental and perhaps optical illusions. In his unnatural vision he sees something. The bushes move, the color of the animal is there, the plan was for his comrade and guide to be on yonder mountain side, far from this spot, and no latent mental forces suggest the possibility of a man being near. He has not that unconscious and mysterious incentive to be deliberate, which he might have were he looking for a moose. In his mental vision he sees a deer. It is real to him, as actual as are the objects in the delirium of a sick brain, yet it is only an illusion. He fires and alas! The one awful thing which he was so positive the other day that he could easily and certainly avoid, when he was indifferently reading of the last accidental shooting, is done. The fatal shot has ruined a home, desolated a fireside, made a widow, made orphans, and embittered and saddened his whole life, and filled his own heart with tears of bitter and eternal remorse. If he had been hunting a moose he would not have stopped and looked before firing because he apprehended that he might see a man. That fragment of thought would be absent from his mind in either event. But yet, although not thinking of a man when hunting the moose, he was sane and thoughtful, because there was something, a grain of thought which passeth our understanding, marvellously lodged somewhere in the recesses of his mind that he might mistake a cow for a bull. While hunting for the deer he had no such mental promptings, for the law has allowed him to kill both doe and buck. There had been no inexplicable mental process unconsciously at work to cause him to ponder with care before firing, and the danger of his killing a man had never operated upon his mind. He had always believed that only the careless killed men in the woods accidentally, and the belief that he never had been and never could be careless at such times was a part of his being. The popular theory is that these accidents are invariably the result of gross carelessness, and this belief is so universal that, being false, it may of itself be the great cause of them. When hunting for the deer he is equally as certain that he cannot by any chance be careless enough to kill a man, and having had no brakes put on to his senses regarding the deer, he loses his mental equilibrium at the critical moment and the tragedy is athwart his life.

The old weather-beaten hunter will tell you of the "buck fever." He cannot explain it. You laugh at it. A scientist could not make a lucid diagnosis of the disease, and yet it is a part of the actual knowledge of this child of nature.

My conclusions are that you cannot enact a law bearing directly upon the trouble that will meet the requirements. Any attempt to improve upon the principles of the common law by legislative enactment would be futile. They are the fruition of the wisdom and experience of centuries. No more can you regulate a man's nerves or control the unknowable operations of his mind, by statute.

In that direction then many we look with any degree of hope for a remedy? I am loth to suggest. My reasoning along this line has not led me into such a clear light of conviction as I have aspired to. The sportsman of high ideals, the true lover of the woods, the worshipper and devotee in "God's first temples" have long been heart sick at this sad feature of pleasure and recreation in nature's trackless forests.

The fact that during the year 1903, it being the first year of the enforcement of the non-resident license law in Maine, there has been a falling off in the number of these fatalities, has been hailed by many as indicative of encouragement for the future. It has been urged that the weeding out process which has been occasioned by this new system has given us a more experienced and trained class of hunters, less liable to these accidents than some of those who have formerly come here. Should these anticipations in the end be realized, it would prove the strongest argument in favor of the law that has yet been uttered by any one.

One thing at least in the line of remedy is within the reach of all. Every sportsman, every adherent to the glorious faith in the gospel of rest and recreation which has been preached to the Americans by a Thoreau, a Murray and a host of others, can continually in the press and upon the platform, in private and in public, in the form and by the glow of the camp-fire, iterate and reiterate the dangers which ever attach to the carrying of firearms into the woods and the joys of the chase. They can all at proper times and places work unceasingly to impress upon the mind the dire necessity of practicing self control and moderation, when engaging in the sport.

But to revert for a moment more to the line of suggestions already made. John Fisk in his essay on "Inspiration," says, "the modern student has learned that

consciousness has a background as well as a foreground—that the number of mental processes go on within us, of which we cannot always render a full and satisfactory account. Many a link is buried beneath the surface, and the coveted flash of memory, of judgment or fancy, does not always come to our bidding." Is it not possible that the cow-moose law has served to draw from the moose hunter's background of consciousness an impulse, at the right instant, to be deliberate, which is so much needed in all modes of hunting. I do not assert that the moose hunter has always been exempt from these accidents, but I believe it is undisputed that usually they occur among hunters for deer. Cannot you bring to pass some more rational and thoughtful mental conditions in the deer hunter by simply forbidding by law the killing of the doe? This idea has been somewhat exploited in the meetings of the Maine Association and by members privately. The answer has generally been that it might not be practical because there is more of a similarity between the doe and the buck, than between the cow and bull. I am not a hunter myself, being obliged to take my recreation with the rod, rather than with the gun, so I cannot speak of this so authoritatively as I could desire.

But I have discussed the matter with experienced hunters and woodsmen and I find that many of them favor it, believing that it would be entirely practical. But assuming that there is more probability of a hunter killing a doe than a cow moose, would not this very fact prove beneficial? Is not just such a powerful influence upon the deer hunter's mind as this needed to regulate and control it in the moment of emergency? There is already an increasing sentiment in Maine in favor of prohibiting the killing of the doe, of preserving the lives of these forest mothers in the interest of general game protection. That we have arrived at a point where it is necessary to do this for this purpose alone, may be open to debate. But if such a restriction would achieve a double object, if it would not only be a humane act to the deer, but in addition thereto have a tendency to protect human life as well, then every sportsman and every one who has these interests at heart should stand for it and no voice should be heard in protest. As noble, as far reaching and as materially beneficial as are the fundamental principles of game protection to the people of Maine, and as anomalous as it may seem to the stranger, they have unrelenting foes, even here within our own State, who are continually on the alert to attack us where a weak spot may be found in our structure. It is therefore our duty to add strength to this code whenever it can be wisely and judiciously done. We are not to necessarily "stand pat" (to borrow a newly coined political phrase), unless such an attitude is absolutely the wisest one. We should be brave and dare to make advance movements whenever these interests appear to demand it. These unfortunate accidents may be at any time seized upon by our enemies and used against us with some effect among the thoughtless and unheeding.

I would not be understood as intending to intimate that there are no cases of accidental shooting in the woods, which are the result of carelessness and negligence and which ought to be punished. There may have been some which would come within this category, and there may be more of them than we are aware of. In any event the investigations provided for by the act before referred to are important; and county officials should be vigilant in this respect, for their official inquiries cannot have any but a salutary effect. The consideration that I have been able to give to this matter leads me to the unqualified belief that the entire subject in all of its phases demands the most careful attention and the best thought of all friends to game protection.

### The Discussion.

Hon. H. R. Virgin—When I came into this meeting, I had little idea of speaking on this paper, or any other, and perhaps I may give you a history of this law, as I have the honor of being the author of it. I had been persuaded to prevent, if possible, these many accidents in our woods. So many of them had occurred, and so much misery had been wrought, that it seemed something must be done more than was provided in the old common law, and one day in the Senate I drafted this bill as it stands to-day, and introduced it, and it was referred to our Judiciary Committee, which has matters of that kind in charge. The matter was discussed in the Judiciary Committee and the objection was brought up that the author of the law had stated that the common law was sufficient to protect matters of that kind, but the more the matter was discussed the more it was conceded that something must be done to arouse interest, and after considerable debate back and forth in the Committee, the bill was favorably reported and went on its passage through the House and through the Senate. We finally concluded that perhaps the best reason or safest ground for adopting the bill would be the moral effect it would have on the community and hunters going into the woods. While in general

they knew, the law of manslaughter, and that it was criminal to kill human beings, we were fully convinced that if the law was passed in its present shape, and was published and posted up in and about the camps and summer resorts, that it would set the hunters to thinking, and possibly they would be more careful than they ever were before. There was one more consideration, and that was this, it had been suggested that some of the accidents were not accidents but were intentional, and had passed for accidents, and in that way the man who had committed the shooting escaped the penalty of his misdeed. That was a consideration that had some influence. But whether this law is a wise one or not, I believe it should be allowed to stand, and should be spread abroad for the moral effect, and it seems to me that the effect will be good, and will restrain this promiscuous shooting that has so often resulted in fatal accidents.

The President—I was a member of our Legislature and also of the Judiciary Committee when this law was passed, and gave my sanction to it, and for the reasons that have been so clearly set forth by the President of our Senate, Mr. Virgin, and by virtue of his position, Lieutenant-Governor, although we don't have that title here in form. I was wonderfully interested in the very able paper that Mr. Sprague has read, as I have no doubt you all were. It was very interesting, indeed. It seemed to appeal to me this mental process by which a man makes a bush look like a deer. No one can explain it. You go out into the woods some day, sit down and commence to look at a stump or bush, and pretty soon that will commence to assume the form of a deer. You can't explain how it is. But what I wanted to say was to correct one mistake Mr. Sprague made. There have been prosecutions under this law. There was a party in Aroostook county prosecuted and indicted by the Grand Jury, and convicted of manslaughter under this law. I don't think he has ever been sentenced. There was one in Somerset county sent to jail for thirty days by Judge Powers under this law. For some reason, at least, we have been more fortunate in the State of Maine since the law was passed than before. I hope the law has accomplished it. I hope the non-resident license law has got something to its credit in that respect, because I hope that the time is not far ahead in Maine when we will all unite that it is a good law, or unite that it is not a good law and get rid of it. We all want to be united on these matters.

## Newfoundland Notes.

### Newfoundland Fisheries and Game.

The annual report of the Newfoundland Department of Fisheries for the year 1903 contains much interesting matter.

It is generally known that the once abandoned whale fishery of Newfoundland has been taken up again within the past few years, and, beginning, with a product in 1897-98 of \$1,581, increased to \$125,257 in 1901-2. Forty-five applications were filed during the year 1902-3, and 858 whales were captured.

The seal fishery—dealing, of course, with the hair seals only—is the largest business of its kind in the world, and in 1903 yielded nearly 318,000 seals, valued at over \$767,000.

The cod fishery is the most extensive and important industry of the colony, and the process of cold storage recently adopted for bait will tend to make the fishery more than ever important and successful.

The salmon streams are also valuable, but over netting, obstructions and pollution by mill refuse have greatly injured the catch, which has declined enormously. This decline has taught the authorities a lesson. The use of nets is now regulated, ladders are being built over obstructions, the hair seals, an important enemy to the salmon, are being fought by shooting, netting, and thus driving them away. The salmon are a great attraction to visitors from America and Britain, and in this way are much more valuable than their apparent market worth.

The license for the killing of three head of caribou stags has been altered from \$100 to \$50, and it is hoped that this will result in the visits of increased numbers of sportsmen, who, it is thought, were driven away by the increased license fee.

Ptarmigan appear to be growing scarcer each year, and it is thought that possibly the ever increasing number of lynxes may to some extent account for this. It is seriously proposed by sportsmen that the shooting of the grouse be prohibited for one or more years in order that their number may be increased.

Fur-bearing animals are trapped more than ever, and, though the law forbids the hunting or killing of beaver, skins have been discovered which show that unscrupulous people are violating it.

### Moose for the Island.

The Newfoundland authorities are making arrangements to stock the island with moose, as will be seen by perusal of the following clipping from a Sydney, C. B., paper. The island is better adapted for the raising of deer than any other country in the world. In fact, it is a vast deer park, as it contains caribou enough at present, if they are properly protected, to supply American sportsmen with good hunting for the next century.

Five of the ten moose contracted for by the Newfoundland Government have been captured and are stabled at Newcastle, N. B. The five in captivity are said to be excellent specimens, and are quite domesticated. A letter written from New Castle to a North Sydney party states that the "big bull moose" is so docile that he can be led with a halter. The moose were captured about a month ago. They were tracked in the New Brunswick woods through the snow and were followed and finally captured in the deep snow where they are able to travel only at a very slow rate. The moose will be taken, the letter states, to North Sydney in a few weeks, or when the remaining five are captured. In Newfoundland there are no moose, caribou being the largest of the wild animals found in the ancient colony. The New Brunswick moose are being brought with hope of stocking the country. The animals will be given their freedom on arriving in New-

foundland. An opportunity will be given North Sydney of seeing real live moose in the course of a few weeks.—North Sydney Herald.

### Caribou Butchery.

THE following item from a St. Johns (Newfoundland) paper of April 14 cannot fail to be of great interest to American, as well as to Newfoundland sportsmen:

"Word comes from Inspector O'Reilly, who is now on the West Coast, that an enormous slaughter of deer has taken place. It appears that some parties traveled up country one day and shot a number of these animals, on the following day, when returning for the carcasses, they found that an enormous herd of caribou had come within a short distance of the coast. Indiscriminate slaughter followed, and it is estimated that 2,000 head were killed. This is a wanton disregard of the law and the parties guilty of such an act should be punished severely. Many of these carcasses will never be brought out of the woods, but will be left to rot where killed. Unless steps are taken at once in this matter, caribou in Newfoundland will soon be a thing of the past."

The migrations of the Newfoundland caribou have been familiar for years, but not less familiar has been the wholesale and wanton destruction which has taken place among this herd. Slaughter such as is here reported cannot long continue without so materially decreasing the number of the caribou as to not make it worth the while for any foreign sportsmen to visit that island for the great game which has always abounded there.

## Spring in the National Park.

YELLOWSTONE NATIONAL PARK, March 28.—*Editor Forest and Stream:* I got back to this wintry country from Alaska on the coldest, stormiest day I have seen this winter. Not even along the coast of Alaska did I find such cold weather. I told my friends I had "put in" two winters already and found I had run into another. I had left Puget Sound country, with its green grass and flowers, to run into a blizzard before we reached Helena.

At Livingston, Mont., and in the Yellowstone Park the thermometer registered 9 to 13 degrees below zero. They all declare here that this is the first cold weather they have had in the Park this season; that it has been a delightful winter. I can believe it, because the game is looking unusually fine for this season of the year.

I see all the mule deer bucks have shed their horns. I have only been from Gardiner to the Hot Springs, still I have seen hundreds of elk, deer and antelope, and about fifty mountain sheep without getting out of the stage. Yesterday I counted 110 mule deer in front of the quarters at Fort Yellowstone. Deer were coming and going all during the day. In fact, no one notices the animals enough to count them, unless they have a report to make or wish to satisfy themselves that they are not dreaming. The deer are lying around everywhere.

The elk are coming in much closer to the Post than ever before. In another year I expect to see them on the parade ground. In addition to the places where game was fed last year, antelope are found to some extent on the flat in front of the town of Gardiner. If the weather should hold severe they will be given all the hay required to keep them in good condition.

The elk are drifting out of the Park in great numbers and feeding even inside of the pastures of the ranchmen miles down the Yellowstone. One ranchman, R. E. Cutler, has written to the local paper complaining of the depredations committed by a band of elk, which have cleaned the feed out of his pasture, to the detriment of his band of horses. He has found it necessary to feed his horses hay from his stacks, where otherwise they would have wintered better on the wild grass in the pasture. So here is a case where people are complaining of the too great abundance of game and where they are not allowed to kill it for self protection or sustenance. They are talking about the bad game laws of Montana—that do not permit of the domestication of any of the wild animals. That the laws are good only for "sports."

The 28 buffalo in the inclosure here are looking fine, and give promise of an increase before many weeks. The tame bull that was held in a corral in the Pelican Creek country a year ago, with a view of capturing some of the wild herd, is now running with that herd, free as the others. An attempt will be made later to capture as many of the calves as possible, to add to the domestic herd. The three calves caught last year are in fine condition now.

Some few dead elk are found, but no great numbers; not as many as would naturally be expected. Major Pitcher has an inclosure in which he is having the sheep and deer feed in Gardiner cañon, close beside the road. These animals can pass in and out at will under the fence. It keeps out elk or any larger animals. The sheep are as tame as wild animals could possibly be without letting you put your hands on them. They will let you come up to the fence to photograph them without even looking at you, as the pictures will show.

I am sorry so few people can be induced to come up here to see the game. Many who have the time will not take it, even when passing through Livingston. They can stop off, run up on the Park Branch, 54 miles to Gardiner, and inside of 5 miles could see all this game I have been writing about for years. Then "there are others" who would like to come, but are "chained to business," like yourself. For those I am sorry. I won't say what I think about the others.

There is not an unusual amount of snow in the Park. I think there is considerably less than usual, judging from the looks of the mountains. There is a little as low down the river as Livingston and all along up to here. Teams have been running all winter to the Upper Geyser Basin, where the new hotel is being built. This is about complete. I see furniture going out for it daily. I did not see the usual number of ducks along the Gardiner River. I do not know where they are, unless they find plenty of open water in other parts of the Park.

I can hear of no depredation having been committed in the Park. The laws protecting the wild animals are very generally respected all around the National Re-

serve, even when rather obnoxious and a burden, as in the case mentioned above. Major Pitcher has been very fortunate in getting the good will of all the people of the surrounding country and retaining it, and their cordial support in his administration of the affairs of this reservation.

Between fifteen and twenty mountain lion have been killed during the winter, and a large number of coyotes. I do not hear them singing as much as usual; in fact, they are very quiet—if there are many around.

T. E. H.

## An Old-Fashioned Winter and Our Game.

WE have had one of those genuine old-fashioned winters of which we have heard so frequently, and some people have enjoyed it. Not the poor, however. The suffering in our large cities has been intense. As for the feathered inhabitants of our fields and woods, large numbers have died of slow starvation, and the quail crop in many places will be exceedingly short next season. In fact, I venture to say that it will require several good breeding years to make up the losses. The quail, or Virginia partridge, is a hardy bird and can endure extremely cold weather, provided that it can procure sufficient food to keep up the vital heat in its small body, but deep snow for weeks with the temperature below zero, is too much for its powers of endurance. We have received reports of the finding of whole coveys which have died on their roosting grounds, and I fear that but few have survived, except in localities where provision has been made for feeding them through the winter. It is pleasant to know that many farmers, either from kindness of heart or a realizing sense of the value of our little friend Bob White, make a practice of doing this in severe weather. On large preserves the birds are, of course, well taken care of.

A fine stock of breeders was in evidence at the close of the last shooting season, and we must hope that enough will pull through to prevent total extinction. This is quite possible, as I remember, many years ago, that in the Cumberland valley, in southern Pennsylvania, where I then lived for several years, not a quail could be found for a period of about three years. This was after a winter which, if I am not in error, was not to be compared with the present one in severity.

The modern quail is a much smarter bird than the one which was pursued by our fathers in the days of the muzzleloader, and in localities where the cover is good, and particularly where large swamps are found, is in little danger of extermination by fair pursuit with dog and gun. The season closes now before the heavy snow storms can reasonably be expected, and the shooting is confined to a few weeks, instead of several months, as formerly.

There can be no doubt, also, that Bob has become educated to a degree that would fill the old-time gunner with astonishment and surprise. He takes to the most impenetrable cover on the first alarm, frequently to swamps that are absolutely impossible. Even when the covey is seen to alight in second growth timber, where the underbrush is quite thin and a heavy carpet of leaves covers the ground, the birds have a way of baffling the sportsman and his dogs which is astonishing. Unless one has sufficient patience to wait until the birds call and move about—sometimes a period of several hours—the ground may be thoroughly beaten without flushing a feather. One or two quail that have absolutely been touched by the foot of man or dog may be forced to take wing, but nine-tenths of the birds can not be found. Various theories have been advanced to account for this peculiar state of affairs, which so often defies the noses of the best bred dogs. Some men say that the quail has the power of withholding its scent, others that they simply pitch into the leaves, press all their feathers tight to their bodies and lie as quiet as stones. Men who have had no experience with these educated Bob Whites are apt to ridicule the statement that the birds can not be found by thoroughly trained and well-bred dogs, but when the same experience is had by many sportsmen during a series of years, the facts do not admit of doubt. It is now many years since I read Frank Forrester's sporting works and Lewis's American Sportsman, but, unless I am greatly mistaken, both of these writers refer to this matter. One of them, at least, believed that the quail has the power of withholding its scent upon occasion.

Below the Highlands of the Hudson and within thirty miles of New York the winters are usually comparatively mild, and a few of the summer migrants can be found throughout the cold weather. Meadow larks we have always with us, but during the past winter I have seen but one, and he, poor fellow, was weak and tame to a degree. These birds are extremely shy hereabouts and last summer they were very abundant.

The cold has had its influence upon all animal life. Recently a fine gray fox was seen on the prowl, during the day, and remained for some time within a short distance of a number of men who were cutting up an old boiler at a deserted mill.

I have not been able to learn anything in regard to the ruffed grouse. This bird had been protected in this county for three years, ending in 1903, and had evidently increased considerably during that time. A fair number were killed last fall, and enough were known to have survived to insure a good stock next season, provided the breeding period is favorable. Grouse habitually roost in the snow and can find food in the buds high up in the branches of forest and apple trees. We may therefore hope that this noble bird has not suffered to any great extent and that we may find it fairly abundant in our covers next fall.

THEODORE GORDON.

HAVERSTRAW, N. Y.

### Points and Flushes.

MR. J. OTIS FELLOWS, of Hornellsville, N. Y., writes us: "We have organized a kennel club, started with forty paid-up members. We will join the American Kennel Club and hold a show in connection with our annual fair in September."

## The Owego Rod and Gun Club.

REALIZING that extreme measures must be taken in order to protect the forest, fish, game, song and insectivorous birds of Tioga county from destruction; a number of sportsmen and others interested in the preservation of animal life met recently in the village of Owego, N. Y., and formed the Owego Rod and Gun Club.

The following officers were elected: President, John D. Ringrose; Vice-President, G. Writer Smith; Secretary, Phillip S. Farnham; Treasurer, Eugene F. Barton.

As stated in Article II of the constitution: "The object of this club shall be to foster a public sentiment in favor of better fish, game and forest protection; to stock the waters with fish and the forests with game; to suggest and aid the enactment of laws for the protection of fish and game; for the preservation of the forests; to aid in the enforcement of the laws for the protection of song and insectivorous birds, and to prevent the wanton killing of any harmless bird or mammal; to seek and destroy all illegal devices used for the capture of fish and game, and to prosecute all violators of the law relating to the foregoing that we are able to apprehend in Tioga county."

Although the club is less than a month old it has over 177 members; it has restocked the streams of Tioga county with 25,000 trout; it has placed an order with the State fish hatchery for 2,000,000 pike; it has compelled several saw-mills to cease dumping sawdust into trout streams, and it has made an appeal to the public by causing the following notice to be published in the leading newspapers of Tioga county:

"With a view to protect animal life generally and enforce the laws the club asks the public to assist it in the following ways:

"1st. To report any violations of the game law to its officers.

"2d. To prevent the killing of birds or the destruction of their nests by boys; by forbidding their children to do so, by threats of arrest, by warning suspects not to break the law, and by reporting violations of the law to the club.

"3d. To protect the song and insectivorous birds throughout the county by providing them with nesting boxes, and by fastening small bells about the necks of house cats, which will often alarm birds before the cat approaches them within springing distance. A stream from a garden hose or a few dippers full of water will effectively stop persistent visits by cats to trees and

bushes where nests containing young birds are located. "4th. To help exterminate the English sparrow by shooting into flocks in the fall and by destroying their nests during nesting season.

"The club confidently believes that after it has procured a few convictions much of the wanton destruction of animal life will cease, and the laws regarding fish and game will be better respected."

The club wishes to co-operate with anyone in the matter of animal and forest protection. With a view to keeping up the interest among its members the club will open a reading room, where the leading sportsmen's periodicals will be found. Any literature bearing upon the subject in which the club is interested will be thankfully received.

PHILLIP S. FARNHAM, Sec'y.

OWEGO, Tioga County, N. Y., April 1.

## A Report on Quail.

WAYNESBURG, Pa., April 16.—*Editor Forest and Stream:* I clip this item from the Pittsburgh Leader:

Cumberland, April 16, 1904.—The body of Captain S. A. Bradley, residing near Sylvan, Pa., was found in the woods near his home, and, from the indications, he had been accidentally killed by his own gun. He had been hunting wild pigeons. What do you think about wild pigeons here?

This has been the longest and the coldest winter I ever knew, and I remember very well the winter of 1855 and 1856. I was about ten years old. The spring of 1856 and for several years after that year we had great flocks of wild pigeons in this part of the country. But not one pigeon has been seen for twenty years in this county.

My father died in April, 1856, and he had possibly the only double-barreled shotgun in our county. A German named William Baker, who served in Mexico, drifted back to our village with the few volunteers who represented our county in the war. Somewhere in the South he became possessed of this double-barreled gun and brought it to Waynesburg, and my father bought from him. The gun was of English make and a good one. That was the beginning of my field shooting, and I have kept it up ever since and hope to put in a few more seasons yet.

As I have said, the present winter—although this is the 16th day of April, snow fell here to-day—has been the longest and hardest in my recollection. Yet I am glad to report that we have some quail left over. For

years I have made it a rule to make inquiry of my friends in the country about the birds, especially in the spring. Here is my record:

Feb. 24, Joe Patton saw eleven big, strong birds; Feb. 27, Jack Cummins saw seven; Feb. 28, Wendal Scott saw twelve; March 10, A. A. Purman, our Burgess, had a friend report to him that he had seen six on Stewart run; March 10, Will Bork heard two calling, and two days later saw ten in the same neighborhood; Sunday, March 12, myself heard two quail calling late in the evening, but it got dark before I could find them; March 15, David Lapping saw eight or nine quail on his place. These birds had been seen frequently by Mr. Lapping early in the winter, but disappeared for several weeks, but turned up after the severest part of the winter had passed. Sunday, March 20, I found three quail. John Stephens reports that he heard several quail calling one evening during the week ending March 26, and that one of his neighbors had lately seen a covey of ten or twelve the same week. Joe Patton found five quail on his place April 14. John Stephens found seven quail April 16 on his farm. These reports come from widely separated districts, so you see that we are likely to have some quail the coming season.

W. L. A.

## The Alcohol Tax Bill.

GALESBURG, N. D., April 19.—*Editor Forest and Stream:* I have noted with very great interest your editorial on the unjust tax on ammunition because of the stringency of the laws on the taxation of alcohol in the United States and beg to remark that very many other industries are similarly handicapped by this taxation. In the United States Government crop report for February or March, 1903, I saw an article on this subject, where it was stated that the condition of the whole German nation had been benefited some 50 per cent. by the use of alcohol in various ways after it had been rendered unfit for beverage, or denaturized, as it is technically known. They make it over there out of potatoes, and it is used for lighting and heating and motive power in place of kerosene, gasoline and coal to a very large extent. It is sold at about seventeen cents per gallon when denaturized. You can readily see that such a bill as Hon. Mr. Boutell is advocating would interfere with many interests in the United States backed by considerable influence. In fact, I reckon he is up against the fight of his life to get it passed, but if it will benefit this nation as much as it has others, as I am convinced it will, it certainly ought to be made law at once.

J. P. W.

## Some Angling Experiences at Long Lake, Michigan.

### Indian Stone Implements—Enoch the Hermit—Present Attractions.

Under the greenwood tree,  
Who loves to lie with me,  
And tune his merry note  
Unto the sweet bird's throat—  
Come hither, come hither,  
Here shall he see  
No enemy  
But winter, and rough weather.

—As You Like It.

LONG LAKE is a clear, deep, forest-girdled tarn, with glimpses of meadows and fields; and dear to the writer because some of his first real fishing of boyhood was enjoyed there.

Such small, inland lakes are enshrined in the memories of far more men and women than is supposed. In distant cities, breasting the onrush of heavy business duties, joying in a strenuous life, practical, abrupt, they yet cherish recollections of happy days when they went a-fishin' on some especially loved lake or stream.

"\* \* \* dear the schoolboy spot  
We ne'er forget, though there we are forgot."

Gone, but treasured up, and thought of in what night-watches, child-days when the first sucker was snared in the creek, when they first fished at night beside the fire built on the shore of the pond; and it was so fearful to get those biting, horned bullheads off the hook without a puncture of the hand that made it ache for an hour! And then followed the years when the boy came home from school, and the vacations of midsummer were spent beside and on that lake, which will always have a place by itself in his heart, no matter what trout and salmon waters he may have visited if he has become a veteran angler. In like measure, the scribe yet joys over his first boat ride and real fishing experience, nearly fifty years ago, at Long Lake.

It is situated about two miles north of Fenton, Mich., a station on the Grand Trunk System—just a blue tarn a mile wide and five miles long. But when I first saw it with the eyes and heart of a child, it was a

boundless blue ocean, hauntingly beautiful, dangerous, and full of mystery!

Facts about eastern Michigan's early Indian history are rare, and often lack confirmation. Detroit "antiquarians" mention that history in generalities. Books and manuscripts in the Library of the Historical Society at Lansing have little more than mention of a few early chiefs, and the supposed locations of some of the tribal villages. The remaining void is full of imaginary "legend" and "tradition." No real history of the early redskins of that region exists. Instead, bands of Ojibways or Chippewas, Mohawks, Algonquins, Hurons, Wyandottes, Sioux, Blackfeet, and even of Delawares or Lénapés, are said to have roamed south and west of what is now Detroit. Amusingly shy references are made to their customs and habits—methods of courtship, marriages, birth and death rites, hunting, war and shadow dances, and computation of time by leaf-falls and moons; and to how their medicine men wailed, and had trances and practiced incantations; and what were probably their weapons, costumes, religions, tribal totems and badges of rank, only chiefs being allowed the wearing of eagle's feathers.

In an anonymous manuscript of the Moravian Society's library at Bethlehem, Pa., is a casual statement that a party of Indian dignitaries and warriors, with Father Marquette traveling with them as a guest of honor, once camped "for some days on the east shore of Tobique Pond (now called Long Lake), south of Flint." He even visited the "large island" in the lake, and "found only woods, wild bees, crows and pigeons." This statement lacks proofs. A dozen places claim the honor of Pere Marquette's grave. No real history exists of those years preceding his work in Michigan. A few memories handed down from father to son and changing their facts in passing, a few disjointed, pitifully isolated and uncertain statements jumbled into mostly unread books! Nearly all the real history is lost in oblivion. Recognizing what would be its vital interest if even fragments of it were known, local poets and prose writers around Long Lake the beautiful, have occasionally mentioned in print, the usual self-created "legend" of a fair but dusky maiden, who, at some remote date, was the daughter of a fierce chief named, say, War-Eagle or White Cloud, whose lodge or wigwam was pitched on the island. This young woman was loved by a bold young warrior, who always "laid the fruits of the chase at her feet." Her "sire"

always helped eat them, but had ordered her to marry an ugly, cruel aborigine from the North; presumably he lived near Flint. The lover is told to begone, and hides his time; the lady becomes thin and pale. But soon the signal-cry of a seeming whippoorwill in the woods sets her young heart a-flutter. Stolen interviews in the forest, words far sweeter than wild honey, vows under the starlight as winds sigh and water ripples. A great storm at night, stealthy elopement, pursuit, an upset canoe and a double drowning! Two corpses buried in one grave, while the squaws stand about in their blankets and wail! The repentant chief and father lingers, fades, and dies while his daughter's spirit returns from the Happy Hunting Grounds to assure him of forgiveness.

This same legend has worked overtime around many a little Michigan lake, with its incipient Coopers and Longfellowes.

A few relics of the actual handiwork of those vanished aborigines are, however, actually left to us—wonderfully interesting messages written in stone by hands long crumbled to dust. Mr. L. B. Shipley, of Fenton, has a fine collection of prehistoric stone tools and weapons found around Long Lake. It contains over 800 arrow and spear heads of flint, jasper, hornblende and agate, and pestles, mortars, knives, drills, battle-axes, tomahawks, and green and plain-band charms; also many pipes of curious design. He has two or three of the hammer-stones used by those workers in fashioning these implements from rock; and the "pits" worn into them as they were grasped between deft thumbs and forefingers are wonderfully eloquent and interesting marks by hands forgotten ages ago. For some of these tools bear the distinguishing features which experts like Mr. Abbott, who wrote "The Stone Age," declare are the marks of the work of the Stone Age people.

Another and most notable collection of stone prehistoric relics found near Long Lake, is owned by Dr. A. R. Ingram, of Fenton, consisting of stone axes, celts, chisels, hammers, corn-crushers, stemmed and barbed arrow and spear heads, drills, perforators, scrapers, knives and pipes.

Near the north end of the lake, as late as 1840, were traces of the flint quarry where the Indians had made stone tools,—piles or "pockets" of bits of rock partially fashioned, and then rejected. There were also two Indian burial places; one about a hundred rods east

of Woodhull's on the east shore, and the other south of Fenton. Such old residents of that town as ex-Senator Crane and Mr. and Mrs. Joseph Seaton have many memories of what their fathers and aged neighbors told them of life among those Indians almost a century ago.

The cabins of a few white settlers had been built in the county as early as 1830, and two or three houses were within a rifle shot of Long Lake in 1837, when Michigan became a State. Among these settlers was Enoch Smith, who had come from "York State" with a wife whose maiden name was Dane; and he purchased what was then known as the Barnum farm. But he was crippled, having crooked fingers and a crooked foot, bad handicaps always, and doubly so when that pioneer life called for the hardest work from even burly men of perfect physique. Five or six years were enough, in spite of the kindly aid of his few rough-handed neighbors, to make him reach his first great loss. His farm was another's. He and his wife went to live on the island in Long Lake in 1845. With all too weak hands they built their house, partly a cave dug into the south bank, and partly a bark-roofed shack. Cold, privation, malaria and hopelessness were

LEMAN'S LOG CABIN, LONG LAKE.

borne by his wife for two years, when she died there.

The crippled, desolate old man became locally famous. Enoch's Island was known far and near. And Enoch lived there alone, supported somehow by selling bad whisky and worse cigars to fishermen. But they were the best he could buy. All sportsmen were warmly welcomed. He dressed, fried and served fish that he would help catch; and his kindly attentions were always welcome as his hearty "Come again!" But he was lapsing into a true hermit. No other woman would share the earth-shanty of the grizzled, dirty, cross-eyed, crooked-fingered and club-footed Enoch. He did not have the consolations and promise of religion; his home was a den, his life a slow tragedy. But he loved nature and that home—no place like it, be it ever so humble!

His longing for companionships and love was shown by his strange pets. With him lived a big spotted cat (a rare chipmunk), and two or three water-snakes that would come to be fed with crumbs when he called them by knocking two stones together under water. In the house were four or five doves. Chained in a big wooden cage outside was a badger he had caught there and which he had taken to the mainland and villages and exhibited from house to house at five cents "admission," until interest in the animal had ceased.

That whole-souled, energetic man, Capt. Bennett, of Fenton, pitied Enoch, and built him a house on the island, painting the house red. And anglers did not think a visit to the famous black bass fishing there complete without a call on old Enoch, "monarch of all he surveyed," "lord of the fowl and the brute." He was often styled "the governor," so the isle with its only resident became known as Governor's Island.

In 1858 the writer and another boy spent nearly a whole day with Enoch. Ragged, gaunt, his lean, starved face seamed with sorrowful lines, his rickety table always between the chair he sat in when eating his meals and a better chair on its opposite side which his lost wife had once occupied—what a pitiful tale of want and hardship was disclosed even to the two urchins! They felt and understood something of his mute, stoical submission to his lot, of the hunted look in the sunken black eyes peering from under the dirty straw hat. Yet he tried to be cheery with us even when suffering from "ager," gave us a "ride" in a swing under the trees, and showed us where he had nailed a cigar box with a slit in it to receive the pennies of those who might use the swing in his absence—for he often fished all day for months, and sold his catches for scanty shillings, cast-off garments, boots, and the provisions which kindly neighbors gave in pretended barter and real compassion for the solitude and pathos in the old hermit's life. He was yet selling firewater and cigars to anglers; and even managed to make a lemonade for us.

"Wanter see my childern?" he quavered. Then he called the spotted cat to purr and rub against his old boot legs. The three doves cooed and ate from his hands. He rapped for the water-snakes, and two came swimming for their meal of breadcrumbs. Then he pulled the badger from the cage by a rattling neck chain.

Finally he "give" us a ride in his dingy boat, whose name, Marier Jane, was daubed on the stern with black paint in letters of very bad shape and worse relative size and position. And he seemed overjoyed when we gave him a whole half dollar; and asked us to accept a basswood bowl and ladle made by himself. One of these bowls is yet preserved by Mr. Charles Case, of Fenton, who now owns the island.

Old Enoch lived there eighteen years, sadly repulsive

and dirty, almost friendless, and feeble. What he dreaded became inevitable. He died in the county poorhouse. Diligent inquiry fails to locate the grave of either his wife or himself. How few of the summer cottagers there now think of him, and his quaint, primitive, humble life, of the paths that his long-vanished footsteps wore across the island, his love of nature—beauty, and doves, cats, and even water-snakes—the love that Coleridge makes the central theme of his "Ancient Mariner."

Now a dozen cottages are on the island. Flint, Pontiac, Owosso, and smaller towns are within an hour's run by rail or carriage. The primitive craft are replaced with steam launches and jaunty row-boats. There are smooth lawns, and cool porches, and musical instruments are played as the water glistens under moonlight. Cedar Point, The Highlands, The Cove, and the Shallows are visited not only by anglers, but by many summer loiterers. Through woodlands gigan tents, where "wood smoke is smelled at twilight," as camp-fires are started.

And even yet the fishing is very good. Bluegills, sun-fish, eels, perch, rock bass, calico bass, pike, pickerel, and a few Oswego bass were to be had there last summer; and we cooked them on the rocks along the east shore, or on the island. And there are numerous small-mouth black bass. A picture is given herewith of a catch of 37 pounds of these royal fish taken before breakfast last summer at Long Lake by four men. Mr. C. A. Doty, of Flint, took twenty bass (1 to 4 pounds each) in three hours by casting with a "yellow-kid" hook. In August Mr. John McCollum, of Fenton, took an 18-pound pickerel, using a small perch for bait. Rev. S. A. Northrup, of Kansas City, landed a 16-pound pickerel. Such veteran and experienced anglers as Charles Begole, of Flint, seek no further than Long Lake for a good fight with the black bass, and an environment of nature beauty. And for the writer, not even the trout and salmon fishing of British Columbia and Newfoundland has robbed Long Lake of its charm. Shrunken to a tarn but five miles long and hardly a mile wide, crossed twice in a single day by swimming, it had its own sylvan appeal and hypnotism. No greener woods, bluer skies or more fair clouds. Memories of the "giant" waves a half-century ago seemed rather absurd as I faced the realities there in 1903; but it was all quite as attractive to the man as it had been to the boy. Such angling waters are of especial interest because they are easily reached by fishermen, campers and cottagers with scant time and money—people who cannot afford to visit the really wild and remote, painfully reached and almost unin-

A BIT OF SHORE LINE.

habited regions that, as a rule, seasoned sportsmen of leisure and wealth tell about.

The angler is always sure of a "mess" of at least panfish at Long Lake. Those cool, spring-fed depths (the deepest water is about sixty feet) readily yield these fish, even though the fisherman be inexperienced. And when the bells at the farmhouses sound their warning that the noon hour has arrived all too soon and unexpectedly, panfish, freshly caught and dressed, cooked beside the mineral water spring and over the little fire kindled a dozen feet from the shore, are always delicious and welcome. One has but to anchor almost anywhere along the bars, or at the edge of blue water outside of the bulrushes, and the panfish will welcome his bait even when he uses the rudest tackle. But he may grow petulant over their skill in stealing his bait. This is especially true of that pugnacious, sly little rascal, the brightly marked yellow perch, a fish often despised because so common, yet a real fighter, and always ready to play a game of nibble-and-jerk with you. Place him in a warm, unclean pond of discolored water, where a trout would die in a single day, and he will live and accommodate himself to circumstances, and be fairly happy. Give him a home-like, cool, roomy, clear Long Lake, and catch, dress and fry him along shore, and I risk the statement, even in the columns of FOREST AND STREAM, that no fish that swims has a more delicious, appetizing flavor and relish than the despised yellow perch.

Long Lake is not really wild. Yet it is very beautiful. Out beyond the woods, and poised on the topmost twig of some elm or maple left standing in clover meadow or wheat field, bobolinks flutter and trill; larks, robins and thrushes "ring their silver bells." Ducks and even sea-gulls are there. Loons glide, dive, yell and watch at safe distances. No fairer dawns and twilights of evening, no more fragrant smoke from camp-fires, or more ideal free sites for the humble tent or

little cottage beside shores where white and gold gravel shows through pellucid water! Nature beauty wanders everywhere, and its home is anywhere that water sparkles clearly, and where green forests are happy as leaves whisper in winds, telling each other of mystic presences.

The fare to the lake from the railroad depot at Fenton is 5 cents on the horse cars. It is surrounded by a fine farming country. Market wagons with fresh meats, butter, eggs, breads and milk come right to the tents and cottages, and the prices for camping supplies seem very low to the city man. Lakeside boarding houses called "hotels" will furnish comfortable rooms and excellent meals for a dollar a day; and boats, with bait and rude poles and lines, will cost 25 cents a day. Or one may rent, buy or build a cottage, and delight his family with a couple of months in those woods on the east side of the lake near its north end, where the rock effects and mosses are so fine. The man who turns his children loose from such a cottage during the heated term will be surprised at the interest they will take in the coming of the next summer.

And the bass! No livelier fish swims in still water than the small-mouthed black bass of Long Lake. The man who uses light, fancy tackle will need a cool head

FISH AND PICTURES TAKEN BEFORE BREAKFAST.

and deft hand when handling one of those burly water brutes. They are not now to be had easily, although many thousands are in the lake. They have been fished for so much that they have grown cautious, and are the most uncertain of biters anyhow. Conditions may seem perfect, the big fellows may even be seen swimming lazily about, sometimes in schools of three to a dozen in the dim depths, working their fins and seeming to laugh from the corners of their great mouths as they refuse to take the most tempting minnow, frog or grasshopper. And on other days, when the wind is in the unlucky northeast, and under a midday sun, you will get a half-dozen fine bass, averaging 2 pounds each, in a couple of hours of either still-fishing or trolling. This uncertainty as to "luck" is one of the chief charms of fishing. Any moment you may get a startling strike, or you may return to the dock and to camp with only what you cannot show—the beneficence and charm of having been right out in a brisk wind that has set the waves to running in mimic wrath and turbulence—out where you have watched the slow flight of crows and herons, and the bullet-like flight down the wind of red-heads, mergansers, teals and widgeons.

L. F. BROWN.

## A Small Boy's First Fishing.

"UNCLE ED, take me?"

Down back of the barn, where the soil was damp and rich, were a man and three boys, in the early evening of a pleasant July day.

The man, evidently but little past his majority, was tall and erect, and as he turned the earth with a fork, the muscles in his bare arms played back and forth, every motion attesting perfect health and strength.

Each forkful, turned and broken, revealed wriggling, squirming earth worms, which were eagerly pounced upon by the boys and carefully deposited in a wooden box.

"Well, I don't know; seems as though you are pretty small to go fishing; but then, the sooner you begin the more fishing you'll get. Yes, if your mother's willing, you may go."

The little red-headed, freckle-faced boy instantly transformed from a baby, who must always stay at home, to a boy, who could go fishing, and do other things boys do. Perhaps he might go swimming soon.

"Oh, Uncle Ed," he'll scare all the fish," cried one of the others, perhaps three years the red-headed boy's senior.

"And maybe he'll fall in," chimed in the other.

But the man explained that four poles would catch more fish than three, for the more baits, the more the fish are attracted, and so it was harmoniously decided that the "kid" might go. For, you see, the man was a diplomat, and whatever Uncle Ed said was generally right in the boys' estimation.

In a short time the box was half filled with worms, which were covered with a little earth. Then the party quickly cut around the hog pen, through the cow yard, and so to the wagon shed, where were the fishing poles.

"Say, bub, you run in and ask your ma, while I fix a pole and line," and little red-head scampered in at the back door.

He was gone some minutes, during which time the man deftly attached a heavy linen line to a short, light, cane pole. The line was made long enough to equal the length of the pole, and was firmly tied to the tip, while the longer end was wound spirally around the pole, till it came nearly to the larger end, where it was securely fastened. A stout pout hook, with a long shank, was then tied to the free end and the outfit was completed with a liberal supply of tea lead and cork.

Just then a troubled little face appeared at the door,

followed by the worried face of the mother.

"Say, Uncle Ed, didn't you say I could go?"

"Why yes, Em, let him go; I'll look out for him, and fishing is good for boys."

But the mother could hardly believe that her baby was big enough to go fishing, and it was only after a fall of bitter, but still hopeful tears, that it was arranged that the boy might go, but the mother and an aunt were to follow to see no harm came to the party.

While the boy keenly felt the humiliation of having the mother follow, still the fact of going with the other fellows made him feel quite like a man.

They followed the main road, down through the pretty village, past the blacksmith's shop, where that morning the boy had watched a yoke of oxen shod, till they reached the brook, which, with numberless turns and crooks, winds for nearly a mile down through a long, green meadow, without tree or bush, with many a deep pool, homes of numberless pickerel, perch, pout and sun-fish, and an occasional trout.

Just below the bridge is a big deep hole, where the brook broadens out into a miniature pond, just right for boys to fish in. And here, after hooks were baited, four corks serenely floated while as many fishers anxiously awaited "bites."

Soon the boy's cork was jerked under, and with a mighty pull the line and bare hook whizzed through the air.

"Next time let him have it till he has a chance to swallow the bait," admonished the uncle, but in a minute the operation was repeated. Soon, however, when another bite came he waited—waited till the cork went down, down out of sight, and the boy must pull, or be pulled into the brook, it seemed, and then—the boy had caught his first fish, a goodly pout.

Then, perhaps, he wasn't glad to have the mother and the aunt smiling down on him from the bridge, and they must needs come down to the bank and admire it, and "heft" it, which they did after the uncle had strung it on a forked stick.

After the man had shown him how to take a pout off the hook without getting "horned," the boy's hook was rebaited and he again cast in.

During this time the others had been successful and the water pail boiled with captives. After the boy had caught another pout and a kiver, which "horned" him cruelly, bringing the tears which would come in spite of him, his cork was pulled down stream with such a mighty tug that the pole was nearly jerked from his hands.

With a long, strong pull, he threw, flopping, on the bank behind him, the most wonderful fish he had ever seen, with mottled back, white belly, red fins edged with black and white, and the prettiest red and gold spots on its sides, a splendid trout, over a foot long, plump and in the best of condition.

That was twenty-seven years ago, years full of joys and sorrow, during which the boy has fished on every possible opportunity, has learned much in the school of experience, and has taken other boys fishing just as the uncle did on that memorable evening so long ago.

For nearly a decade the uncle has lain in the grave yard on the side hill overlooking that same brook. How often the boy wonders whether his uncle is now where quiet streams run through green meadows, and if the fishing is good, and whether they shall not some time wander again together through meadows and woods as they did so many times in those happy days.

WORCESTER, April 11.

## Fish and Fishing.

### A Backward Spring.

SOME of my correspondents in the United States have been calling me to account for failing to say anything in these columns about the spring prospects for trout fishing in Canada. The fact of the matter is, however, that so far there are no prospects here, either of spring or of trout fishing. We are within a week of the first of May at present writing, and there are still from two to three feet of snow in the northern woods, while all the lakes and smaller streams are still covered with ice, which also extends from shore to shore of the St. Lawrence, within ten miles of the city of Quebec. The weatherwise say that the prospects are for continued cold weather for another week or ten days, and that spring, or rather the summer, will be on with a rush at the expiration of that period. Local anglers are not overmuch disappointed at the lateness of the season, for it is a well-known fact that the best fishing is experienced, in northern Canada, in those seasons which open the latest, and though the law permits trout fishing from the first of May in the Dominion, it is generally long past the middle of the month before the fishing can be called good.

I have not heard yet of any American anglers who intend to be here on their way to their fishing preserves in the Lake St. John country before the last week of May, and the open fishing for the big trout of Lake Edward is scarcely likely to be at its best before the 20th of the month, although the fish commence to take bait beneath the surface of this body of water as soon as the ice has broken up and even before it has altogether disappeared.

It is understood that the management of the Amabish, the Triton and the Nonantum clubs expects many of their members for the spring fishing this year, and many inquiries are being made as to the progress of the season.

It will not be safe to count upon good ouananiche fishing in the Grand Discharge before the middle of June, and, in fact, it is unlikely that the hotel there will open before the 10th or 15th of the month. But in the mouths of the rivers flowing into the lake and round about its shores, within a few days of the departure of the ice, there will be, no doubt, good sport, the ouananiche generally rising in these localities from about the 15th or 20th of May.

From correspondents in Michigan and Ontario, I learn that the season there is also extremely backward.

A Chicago friend writes very complainingly of the laws of some of the Northern States which forbid the visiting angler from carrying away his catch, so that my correspondent says that it detracts from the pleasure of netting a two-pound brook trout, to know, when it is landed, that you can't send it to the loved ones at home as proof of your prowess. The Canadian laws are more considerate

to the angler, permitting him, as they do, to take away with him the result of a reasonable two days' catch.

E. T. D. CHAMBERS.

## When Do Fish Bite Best?

NEW YORK, April 20.—*Editor Forest and Stream:* I read lately in the New York Sun about large game fish not feeding early in the morning, and the writer of the article mentioned the big bass of Keuka Lake as being examples of this alleged fact. I would like to have an expression from your readers on the morning feeding of trout, pike, bass and pike perch. As to bass, I recall that in Schroon Lake the fishermen and their bait had to be on the grounds before sunrise or there was no string to bring home. Up at Port Henry, men who take the great pike perch in the channel between Chimney Point, Vt., and Fort Frederick (Crown Point), hie there with their pail of shiners, or brook chubs, not later than 4 A. M. and never fish after warm sun up. They often make great hauls before breakfast—with the lines, of course.

For three or four years I trolled for pike along the Vermont shores, from Chimney Point to Potash Bay, using a plain kidney spoon (Bull), and used to have splendid success with these huge wolves, just as the sun was rising, and also just as it was sinking behind old Bald Peak on the west shore back of my home. Either time was good, and I confidently expected a strike in certain bays and at well known points at these *points du jour*. There were some days when the pike and pickerel bit all day long and I recall my record catch, seven pike, total 33 pounds, so heavy that I called for the horse and wagon to carry them from the boat house homeward. The largest weighed 9 pounds, and there was not a really small fish in the string. This luck fell to me one holiday afternoon in front of a bunch of bulrushes. I fished for about an hour, all in one place, and had a lot of sport with the largest fish, which was hooked merely by a piece of loose membrane that kept giving as the line was pulled. A lady who watched the fight with a field glass told some nice things about the method of capture which the angler supposed were unobserved.

At Eagle Lake, while pike bite somewhat early, it is almost unwritten law to begin fishing for bass (small mouthed) and perch before about 6 A. M., and people mostly start out for success even one hour later. To begin earlier is considered a waste of time.

I have never found an hour too early to catch brook trout, and they will bite until dark. They are night feeders, for I have caught them in wild mountain streams early in the day when their craws were literally packed with big "June bugs." I have often wondered how bass could be caught after dark. A celebrated New York furrier told me of his success in New Jersey anchoring out and casting in toward shore, using an imitation mouse as a lure. He said he had excellent luck last year.

While trolling with a spoon I have taken at various times a chub, several clams, perch without number, pumpkin seeds, one bullhead, two or three pike perch, one of those white spine-rayed fish that we call "sheeps-head," on Champlain, and considerable pickerel weed.

I would like to hear what the brothers have had strike their "spoons."

PETER FLINT.

## New York Fish and Game Legislation.

ALBANY, April.—The following bills introduced in the Legislature amending the forest, fish and game law have been signed thus far by Governor Odell:

Assemblyman Coutant's (389-979), providing that set-lines and tip-ups may be used in fishing through the ice in Ulster county in waters not inhabited by trout.

Assemblyman Reeve's (376-1587), providing that the possession of wild deer or venison between Aug. 31 and the first Wednesday after the first Tuesday in November, and between the second Friday after the first Tuesday and Nov. 20, shall be conclusive evidence of a violation of this section, unless it appear that the same was lawfully killed within this State, or was killed without the State.

Senate Committee's (611-730), providing for the creation of a State park in the Catskill Mountains, to be located in Ulster, Sullivan and Delaware counties, and giving the public the right to use it at all times.

Assemblyman J. T. Smith's (293-771), relative to the close season for deer in Dutchess county.

Assemblyman G. H. Whitney's (741-876), relative to perch fishing in Saratoga Lake.

Senator Barnes' (410-987), forbidding the sale of trout caught in the waters of Rensselaer and Essex counties.

Assemblyman Simpson's (1140-1527), authorizing the sale of the building on the abandoned Beaver Kill hatchery in Sullivan county.

Senate Committee's (630-800), defining the boundaries of the Adirondack Park.

Assemblyman C. R. Matthews' (687-807), making the close season for lake trout from Oct. 1 to April 15, both inclusive, with certain exceptions.

In addition to the preceding bills amending the forest, fish and game law, signed by the Governor, the following bills passed the Legislature and are before the Governor awaiting his action:

Assemblyman Harvey's (482-848), providing that the close season for black bass in Seneca Lake shall be from Jan. 1 to Sept. 15, both inclusive.

Assemblyman Robinson's (1090-1416), providing that carp shall not be placed in Conesus and Hemlock lakes, Livingston county.

Senate Committee's (783-1013), concurrent resolution proposing an amendment to the Constitution authorizing the Legislature to direct the removal of dead timber on burned areas in the forest preserve so far as necessary for the purposes of reforestation.

Senator Elton R. Brown's (472-852), providing for the acquisition of sites for fish hatcheries.

Senate Committee's (611-730), creating the Catskill State Park.

Senate Committee's (630-800), defining the boundaries of the Adirondack Park.

Senate Committee's (818-1126), providing for continuing the acquisition of land in the Adirondack and Catskill parks.

Assemblyman Cocks' (1178-1594), providing that gray squirrels shall not be taken or killed or possessed at any time in Nassau county.

Assemblyman F. C. Wood's (950-1182), increasing the annual compensation of game protectors from \$500 to \$600, and increasing their yearly allowance for expenses from \$450 to \$600.

Assemblyman Reeve's (438-477), allowing leases of oyster lands to be renewed for terms of fifteen years.

Assemblyman Cowan's (518-1297), providing that there shall be no open season for Mongolian ring-necked pheasants, and that they shall not be killed or possessed, except in Suffolk county, prior to 1910.

Assemblyman Denisons' (1100-1455), providing that wildfowl shall not be taken in the night in Black River Bay, Jefferson county, from sunset until daylight.

Assemblyman Wolf's (383-886), relative to fishing in Jamaica Bay and adjacent waters.

Assemblyman G. H. Whitney's (552-1794), relative to fish and game in Saratoga county.

Assemblyman Graeff's (1267-1761), providing that no fish shall be caught through the ice in Lake Champlain less than five inches in length.

Assemblyman Dickinson's (160-883), relative to the close seasons for hares, rabbits, foxes, trout, etc., in Cortland county.

Assemblyman F. C. Wood's (1202-2032), providing for restocking the Adirondack region with moose and elk.

Senator Malby's (538-1040), relative to fishing in certain waters in St. Lawrence county.

Assemblyman Cook's (115-1470), relative to the close season for trout in Erie county.

Senator Le Fevre's (326-1041), relative to the close season for grouse, woodcock and quail in Orange and Ulster counties.

Senate Committee's (481-754), amending the game law generally.

Senator Townsend's (266-281), providing that trout caught in the forest preserve shall not be offered for sale or sold.

Senate Committee's (951-1363), to prevent waste of the timber in the forest preserves killed by forest fires.

Senator Townsend's (12-853), providing for the protection of wild black bear.

Senate Committee's (668-1014), relative to the prevention of forest fires.

Senator Malby's (758-980), relative to the proceeds of actions brought by the people for violations of the forest, fish and game law.

## Hints and Wrinkles.

Readers are invited to send for publication under this head hints and wrinkles drawn from practical experience, and pertaining to shooting, fishing, camping and outdoor life.

### A Rubber Wrinkle.

Now that cameras of some sort are so often carried into the woods by shooters, anglers and canoeists, anything that will make their use less complicated is generally read with interest; hence I hazard mentioning a wrinkle which, while not original, is very handy, and has saved me no end of trouble during the four or five years I have used it. This is a substitute for a focusing cloth. It consists of a heavy rubber band that will fit snugly around the camera, and a bit of rubber cloth sewed round the band. In form it exactly resembles the elastic cuffs sometimes worn by stenographers of the weaker sex. The rubber band should be a half-inch wide, and long enough so that it will merely fit the back of the camera snugly, yet not so tight as to jar the box while it is being removed for inserting the plate-holder. The rubber cloth should be long enough to encircle the camera easily. The ends are sewed together, leaving the form like that of a bag without a bottom. One end is then turned over enough to take in the band, then hemmed. The other end is trimmed, leaving the bag a foot or fourteen inches in length. Any woman can sew this bag in ten minutes, on a machine or by hand.

In use this bag is slipped over the back of the camera after the latter has been set up on its tripod, and the rubber band in the forward end will keep it in place, no matter how hard the wind blows, and at the same time exclude the light, which is the object sought in the use of any sort of screen. You poke your head into the rear end, and both hands are free to manipulate the instrument instead of making apparently insane motions every second in order to keep a focusing cloth within reach. With a box camera it will be necessary to remove the hood before inserting the plate-holder, but with the cycle style camera so generally used now the hood can be left in place, which gives it additional value. A hood of this sort is so compact it can be crushed in a wad, or folded, and stowed away in the camera, where it will occupy no more space than a silk handkerchief.

PERRY D. FRAZER.

## Camping and Canoe Cruising in Canada.

BY R. W. ASHCROFT.

(Continued from page 820.)

INSTEAD of an old bewhiskered Rip-van-Winkle hermit, we found the island inhabited by as genial a gentleman sportsman as we had ever had the pleasure of meeting, viz.: Dr. Woodruff, ex-surgeon of the steamship Moana, lately plying between San Francisco and Sydney. The doctor bought this island from the Canadian Government for a song (the officials of the Crown's Land Department said there was no such island, as the maps didn't show it), and has built himself thereon a comfortable cabin containing all the comforts of home. The walls are covered with trophies, and the doctor's arsenal and angling cabinets are most complete. That a physician's mind designed the place is evident by its neatness and cleanliness. The doctor has built two landing docks, one for use when the lake is high in the spring, and one when the water is lower in the summer and fall. Indeed, in all its appurtenances, the little kingdom is most complete; and pleasant it was to come across the place, so far away from any other evidence of civilization.

We ascertained here that we could reach Hollow Lake by two routes, both via Raven Lake. The first one was by proceeding to the north end of Lake Senora and then portaging two and a half miles through a swampy country to Wren Lake, with another portage of similar length to Raven Lake. As this meant an actual carry of our boats and stuff, without the aid of a wagon, it was out of the question with the weight we had. So we decided on the longer route, viz.: a five-mile wagon portage by the kind aid of Ward into the Black River and up the river into Raven Lake.

During the course of conversation, the doctor's guide, Nick Harrison, began to discourage about the trout to be found in Black Lake—a lake at the foot of Black River. Of all lakes, he said, that should be our Mecca. As we were keen for sport, we decided to make a side trip, at least, to Black Lake, to test the old man's assertion.

Toward sundown we parted with our good friend the doctor, and journeyed back to Ward's. Passing through the Narrows we observed a pretty little fawn on the shore, and managed to get within thirty feet of her before she took alarm. I shot her—with Gaffer's kodak—but the picture was a failure. We camped near Ward's place for the night.

It took us until one o'clock on Friday afternoon to reach Black Lake, and we made our headquarters in an old deserted lumber camp. We had been warned to be on our guard against one Fuller, said to be a jail-bird, and his two sons, who would steal the pennies from a dead man's eyes, and who were reputed capable of any crime if there was any plunder to be gained. Fuller's ostensible occupation is to keep a dam at the foot of Raven Lake. Maybe the government thought this was a good way to keep him out of mischief when he got out of jail. His two boys are said to be chips off the old block. Only a few days before we arrived in the locality the elder one was said to have made off with a colt belonging to a neighboring settler, and we plainly saw the print of the unshod hoofs of the animal alongside those of a boy, for a couple of miles toward and past Black Lake.

We thought we could fairly see the trout jump in Black Lake, and imagined we could hear the murmuring of the trout streams as they poured themselves thereinto. Even Zack caught the infection, and swore by his bottle of snake-bite liniment that he saw a deer drinking on the opposite shore—at two o'clock in the afternoon, mind you! Casker, in his anxiety to locate the best stream for the next morning's fishing, took Zack in a canoe on a tour of exploration. They were away two hours, and returned sadder but wiser men. They reported that Black River was the only stream emptying into the lake, and stated that their opinion was that "there wasn't a trout in the whole damn lake."

Old Nick! Lucky for you that you weren't around just then. Not even the doctor's guardianship and patronage would have saved your scalp at that moment. To send trout-hungry men to a troutless water! What more heinous crime could be committed?

After a hasty supper we commenced to migrate again toward Raven Lake, in order to make up for lost time. Old Nick's ears must have burned for the next two hours. Four of us took the canoes and pulled them and toted them and the light gear up the shallow Black River to the foot of the first slide; and two of us carried the heavy stuff back over the trail to the same point. Then we paddled for a quarter of a mile to the next dam, and found that it meant a carry from there to the third dam. At the third dam was a bridge, and the place was also known—to us, at least—as "Sand Fly Point."

It had been a warm day, and we were dressed lightly. Casker, for instance, had on a pair of duck pants and his woolen shirt. The duck pants were a tight fit, and proved his undoing. He was carrying a heavy load—as became his physique—when, through some unaccountable accident, or, maybe, Baxter street tailoring, the middle seam of his pants gave way and exposed that portion of his anatomy which most needed protection.

Camp Hoodoo.

tection. The sand flies observed his dilemma and made the most of their opportunity, until dispersed with pennyroyal and tar.

It was nearly midnight before we came across Fuller's habitation, as it was a dark night, and we fetched up in many a blind bay before we found the proper course. His domicile is a deserted lumber camp, too. We noticed a light in one of the windows, and word passed along to proceed silently. We did so, and expected to pass without being observed but failed.

Precipitous Heights.

There is a ford across the stream right opposite the camp, and all three canoes grounded on the gravelly bottom at this point. The noise was plainly audible, and the light immediately went out. I guess Fuller thought we were after the colt, so he kept quiet and did not emerge from his den. We managed to get over the ford and into navigable water again, and were soon in Raven Lake.

"But where, oh where, shall we camp?" was the cry. We spent half an hour in searching for a suitable spot, but none was sighted, so we finally went ashore on an island that seemed clear of trees. It was an isle of granite—nothing more and nothing less—so there was nothing for it but a granite bed, "with the starlight in our faces." We laid our waterproofs on top of our blankets to keep off the dew, and in that manner sought slumber. We found sore hips, and "Camp Gibraltar" will forever remain granity in our memory.

'Tis Saturday morning, and we are within hail of Hollow Lake—at least we think we are. So, despite our hard bed and curtailed sleep, we embark with avidity. Zack

pointed out what he thought was the right portage, but Casker had a dream on the granite last night where-in he saw a sign reading: "This way to Hollow Lake" at the head of a nearby bay, so up this inlet we paddled until we could paddle no more. Then we paddled back, with Casker apologizing at every stroke. We put Zack ashore at his portage, and in an hour's time he reported that the route was O. K. and that the trail was fairly good. However, he counselled that we cache about half of our edibles, which we did.

Oh, Zack, I do not envy thee the trails that it must have been thy lot to traverse, if this one may be called, with truth, "fairly good." I only know that, in my agony, and sore distress, when about half over it, I blurted out to the Gaffer some unprintable execrations.

Casker's blind bay had taken half the ambition out of me, and Zack's "fairly good" trail relieved me of more than I had left, and, for the first time, I felt like a quitter, as did the Guv and Gaffer.

Gun Lake was at the other end of the trail, and Hollow Lake was two more lakes northeast by north. We proceeded to the upper end of Gun Lake and then Zack took two hours to find the trail to Long Lake. We argued: One hour for a "fairly good" trail; two hours for—what sort of a trail?

So, when Zack returned, a council was held over the lunch pail, and it was decided that Zack and Casker should take one canoe and proceed to Hollow Lake, and that the rest of us would wait for them in Gun Lake until Monday.

They left us about two o'clock in the afternoon, taking two days' rations. How they figured out they would need no sugar during these two days, but all the baking powder, was beyond my culinary ken. I tried to make bread as per the recipe I found in the Plasmon cook book that we had with us, but without baking powder, and the result was a hybrid pancake.

Gun Lake was a blueberry paradise. How luscious that fruit was! Wild strawberries, raspberries and blackberries were not quite ripe, but we knew we would have our fill of these before our trip ended. And so we did.

We made camp at the end of the trail leading to Raven Lake, and there proceeded to indulge in two days' loafing. Little we envied Zack and Casker their express trip to Hollow Lake and back, even though it did mean a string of trout for them. Fatigue kills ambition, and our week's hard work demanded recognition.

Towards the close of the afternoon the Guv. decided to make a raid on some of the edible luxuries that had been cached, and went back over the trail to get them. He went alone, and he nearly lost his life, as it proved. He wore a sweater, and the color of it was the worst that could be selected for the woods. It was the shade of fawn. As he neared the end of the trail he heard a noise as of an animal breaking through the bushes. He thought it might be a bear; and, then, again, that it might be Fuller at our storehouse. He stopped, and the noise also stopped. Then he proceeded slowly and cautiously, and, as he rounded a bend in the trail, found himself covered with the ugly muzzle of a Winchester, cocked and ready for business in the hands of a woman fifty feet away.

The Guv. can't recollect whether he said, "Don't shoot!" or "Good morning!" to the lady, but, anyhow, he finally induced her to lower her weapon. As I remarked once before, the Guv. is essentially a lady's man.

A few yards behind the woman stood her husband, with their canoe over his shoulders. Explanations followed, and they parted good friends.

I was alone at the camp when the pair reached there. I thought the Guv. had made a mighty quick trip, over and back, and was flabbergasted to see two strangers approaching me. The sensation was similar to what one would receive if Broadway became absolutely deserted at noon on a week-day.

It turned out that the farmer and his wife were one of the two or three families of settlers living on Hollow Lake; that they had bought a cow in Minden a week before, and that aforesaid cow had apparently started during the preceding night to make tracks for her old home. Anyhow, at four o'clock that morning, there was no cow to milk; so the pair had immediately started in pursuit. They tracked the animal for twenty miles or more, and then had lost the scent and were returning home, feeling sure that she would fetch up in her old stall at Minden, and that they would get her there a few days later on.

That cow was a plucky beast! When we got back to Dr. Woodruff's hospitable cabin the following Tuesday—in time to attend the settlers' picnic, of which more anon—we told him about the cow. He said that on the Sunday afternoon toward dusk the cow had swam across Senora Lake, about half a mile to the west of his island. The distance across the lake at this point was fully a mile and a half. They sighted her with the glass when she was half a mile from shore, flying sig-

nals of distress, and at once set out to help her. She readily followed the canoe, and was soon on dry land. Old Nick said he never saw a cow with a fuller milk bag, but, somehow, we don't believe Old Nick now.

Our trinity of loafers put in a quiet day on Sunday, bathing, blueberrying and salmon fishing. Our farmer-visitor had told us that we could expect to get them as high as 25 pounds with the rod, and pointed out the spot. The Guv. collared a 17-pound beauty, and one weighing 34 pounds made off with my minnow. They are lazy brutes—these land-lock salmon—with hardly a pugilistic ounce in their entire make-up.

We were enjoying fine, clear, moonlight nights, and so we lingered around the friendship fire exchanging yarns until quite late every evening. This night, about an hour after we had turned in, I was awakened by a noise outside, and opened my eyes to see, reflected on our canvas by the moonlight, the figure of a member of the family of bruin. He couldn't quite make us out, and was snuffing around the guy ropes in an interrogatory manner, evidently thinking he had struck the wrong blueberry patch. I woke up the Guv., but the noise we made in getting ready for action scared his royal highness, and he promptly shuffled off into the bush. That was as near as we came to bear-meat, although we saw several of the tribe on various occasions at safe distances.

Promptly at lunch time on Monday appeared Zack and Casker, and we bartered sugar, salmon steak and blueberries with them in exchange for trout and baking powder. According to Casker there is but one place on this hemisphere worthy the reputation as being a rendezvous for trout, and that spot is Hollow Lake, or rather the streams tributary thereto. We intend to test the truth of this assertion next year, but will go in at Dorset then.

"Homeward bound!" was the cry an hour or two later, and it was not unwelcome. All we did on Monday in that direction, however, consisted in making the portage to Raven Lake, and this time we camped on a more arable island in the middle of the lake.

We started out bright and early on Tuesday morning, as we wished to reach the Doctor's island in the afternoon, in order to take part in the picnic. Moreover there was a five-mile tramp from Black River over to Ward's, in order to get his rig to carry our boats, etc., to Lake Kushog.

On the way down Black River we met Fuller and his younger boy, and passed the time o' day to them. The elder boy had evidently not returned from his

colt-selling expedition.

The Guv. and I tramped over to Ward's and found the whole family in their "Sunday-go-to-meetin's," just about to embark en route to the picnic. Here the Guv.'s social and domestic attainments again stood us in good stead, as he immediately volunteered to go to the picnic as Ward's proxy. The way he handled those children and the milk bottle, and wrapped up Mrs. Ward's lemon pies, would indicate that he will be a marital treasure to the girl who gets him. While he paddled the family over to the Doctor's habitation I kept Grandfather Ward company, and learned for the first time how the battle of the Boyne Water fulfilled one of the Biblical prophecies—I have forgotten which.

I have neglected to state heretofore that Gaffer was a crack rifle shot. I recall the fact at this time because, toward the close of this Monday afternoon, Grandfather Ward and I heard five rifle shots in quick succession over toward Black River. I concluded they came from our party, and scented big game. The Gaffer—so I learned on his arrival—had shot a partridge at fifty paces. Has a more astounding feat ever been recorded in the columns of FOREST AND STREAM? Gaffer, here's to you!

We reached the picnic in time to enjoy the squarest meal that it has ever been my pleasure to masticate. The settlers' wives had spent all day Monday in preparing their special tid-bits, and no one appreciated their offerings more than our humble quartette. So amiable did we feel toward the entire company that we even didn't tell Old Nick what an execrable advisor he was.

Outside there was circus lemonade and peanuts and shooting contests and canoe races and what not else! Any 'varsity boat race is tame compared to that girls' race at the Doctor's. These girls handle the paddle as deftly as a matinee girl manipulates her fan. The course was once around the island, and it didn't take long to cover it. The competitors all fought gamely for supremacy, and it was nip and tuck until within a short distance of the tape. The entire land force rushed around the island, vociferously cheering one or another of the contestants; and no winner of the Diamond Sculls ever felt prouder than the two girls who came out ahead and got their prize of a quarter-dollar apiece.

All the settlers round about that island have a warm spot in their hearts for the Doctor, and so have we. May he live long and picnic often!

We reluctantly left the island early—about 7 o'clock

in the evening—our object being to get to the south end of Lake Kushog before camping. 'Twas a bright moonlight night, and the memory of that five hours of rhythmic paddling down a long lake, that was never more than half and never less than a quarter of a mile in width, and whose wooded banks rose steeply from the water's edge at either side, will ever fade away. Three silently gliding canoes with bows abreast, a fathom's length apart; six paddles concurrently caressing the peaceful water; six voices raised in tuneful melody!

The owls were hooting midnight when we arrived at Camp Portage, the spot at which we camped during the rain on our way north. Next morning we made this portage without assistance, and reached Minden, via the Horseshoe Lakes and a four-mile portage, shortly after noon. Here the Gaffer gave up his unerring weapon, got his golden eagle, less 10 per cent., and made a loving au revoir to the fair Mindenite. It will be a hard job to get the Gaffer to go in at Dorset next year.

Wednesday night we camped at the head of Moore's Falls, and met the hospitable occupant of the house at this spot. Our itinerary for Thursday had Coboconk for its destination, and all day long we had in pleasurable prospect that mile of rapid water leading to the town. On the Norland River the portages at Elliott's Falls, Natural Dam and Norland are not difficult, although one should be careful when launching a canoe below the slide at Norland. The Guv. and I nearly met disaster here.

The log drive had disappeared from the Norland River, but when we reached Coboconk River we found it chock full of logs—"a raw right-angled jam"—and perforce gave up any attempt to navigate it, but portaged into the town instead.

This practically ended our trip, as we wished to reach Lindsay the next day, and it would have meant a hard paddle. So we went aboard the little steamer "Manita" and slept on her deck. This boat leaves Coboconk at about 6 o'clock every morning, and reaches Lindsay about noon.

While the steamer was locking at Rosedale, Casker remembered those bass of his, and couldn't withstand the temptation. So he disembarked with Zack, taking one canoe, for a couple of hours' fishing. The rest of us remained on board. As we were passing the locks at Fenelon Falls, the keeper remarked to our pilot: "Where did you ship them Italians?"

'Twas the unkindest cut of all!

## Designing Competition.

### Second Prize Design.

IN this issue there appears the design which was awarded second prize and also the Zerega prize, for the best interior arrangement, in our competition for a 40ft. waterline cruising boat. The drawing was submitted by Mr. Harold W. Patterson, of Yonkers, N. Y. Mr. Patterson sent in the following matter with his design:

#### Description.

IN working out this design the idea has been to produce a boat combining roomy accommodations and seaworthiness with a fair amount of speed and good appearance. The displacement was made rather large to permit of substantial construction and capacity for stores without drawing too much on the stability.

The lateral plane has been left comparatively long, which should make an easy steering boat and one that does not require continued nursing to keep on a course.

The lead also was stretched out, to help make hitching easy.

Judging from the restrictions governing the rigs, it was assumed that they are to be interchangeable, and to simplify the change, not only are the mainmasts and gaffs the same in both sail plans, but the bowsprit and all rigging as well. Topsails, spinnakers and all head sails are also the same, with the exception of the jib, which is a trifle smaller in the sloop rig.

In arranging the cabin plan the idea conveyed by the requirements has been carried out, and ample room aft for three been provided, rather than cramped accommodations for a greater number.

The companion stairs lead into a steerage with a chart room on port side and store room opposite. This arrangement enables one to remove oilers, boots, etc., in wet weather and also for the man on watch to refer to charts, etc., at night without disturbing the occupants of the cabin. The chart room is provided with lockers and table, with a place under where charts may be kept flat. The small locker for instruments has a shelf on top, within easy reach of the cockpit, for marine glasses and any small articles which may be wanted handy.

The store room has lockers for boots, oilers, etc., dress suit cases and miscellaneous stores. Sliding doors separate the steerage from the saloon, which keep it warm and dry in stormy weather.

On either side of the short passage are cabinets with glass doors, for guns, fishing tackle, etc. The saloon is fitted with fixed berths, 2 feet 6 inches by 6 feet 6 inches, with springs on each side. These can be made up in the morning, thus avoiding the nuisance of stowing bed clothes during the day and trouble of making them up when ready to turn in. In front of the berths are cushioned seats, 21 inches wide, with drawers under. At the after end are two hanging lockers for clothes, and two smaller ones at the ends of the berths. Forward on the port side is a buffet, fitted with lockers and drawers for table linen, silver, wine, etc. This is conveniently located for the steward when serving the table. A large skylight and four air ports give ample light and ventilation. Forward of the saloon on the starboard side is the owner's state room, with permanent berth, 2 feet 8 inches by 6 feet 6 inches, with drawers under, dresser, lavatory, hanging lockers and seat. Part of the saloon skylight and an air port give light and air.

Close to the bulkhead and in the passage is a part of the centerboard trunk, extending above the water line, for accessibility in case the board becomes jammed. A brass pipe for the pennant extends to the roof. Opposite the stateroom is the toilet, fitted with w. c., lavatory and lockers. It is convenient, especially for the owner, at the same time is not conspicuous. A circulation of air is obtained from an air port and ventilator in the roof.

A door leads from the passage into the galley. This is fitted with stove, sinks and dish racks on port side and lockers, ice box and table on starboard side. The ice box has a capacity of from six to eight hundred pounds. The doors open above and below the table. There is full floor and head room all over, and a skylight and two air ports should keep it well lighted and ventilated.

Forward of the galley is the forecabin. This is larger than usually found in boats of this size, and provides lockers and berths for three men. On the port side is a w. c. A folding wash basin could also be fitted in here, if desired, although it is not shown. There are two air ports on each side of the forecabin, and although they may detract somewhat from the outside appearance of the boat, they ventilate and help keep decent these quarters, which are generally the opposite. There is a maximum head room of five feet. Forward are chain lockers and storage for lamps, oil, etc.

#### Dimensions.

## An American Challenger in Foreign Waters.

Editorial in the New York Herald.

IN a wind that blew half a piping gale the schooner yacht Ingomar left our coast yesterday for a port of arrival in British waters. The run across the western ocean is at this season apt to be boisterous, and we may confidently expect that the stanchness of hull and seamanship of crew and master will be tested to the sharpest edge of their metal. No holiday work awaits her. Fresh honors are to be won and one old defeat awaits a brisk and hopeful challenger, and so the good wishes of the country follow an owner who has for the welfare of the noblest game shown so much sporting interest.

In the forthcoming contests the Ingomar will fly the pennant of our senior yacht club, thus reasserting its ancient tradition for outside races and, let it be hoped, maintaining its old record of blue water successes. How much the New York Y. C. has done for this particularly stirring aspect of the sport is either unknown or forgotten save by a few enthusiasts, and therefore the marvelous account of its sea work, published in the current number of FOREST AND STREAM, is little short of a revelation. The study of these achievements off soundings may well be commended to yachtsmen, both as a publication of our claims as a seagoing people and as an incentive to their support of the outside races promised for this year.

DESIGNING COMPETITION—DESIGN WINNING SECOND PRIZE AND ZEREGA PRIZE FOR BEST INTERIOR ARRANGEMENT—LINES, CABIN AND SAIL PLANS.  
Submitted by Howard W. Patterson, Yonkers, N. Y.

## Boston Letter.

**Boston, April 25.**—Com. Laurence Minot, of the Eastern Y. C., has reappointed I. Tucker Burr, Jr., fleet captain, who has issued the commodore's orders for a cruise, as follows:

Friday, July 15—Rendezvous at Marblehead; captains report on board flagship at 8:30.

Saturday, July 16—The fleet will sail at 3 P. M. for Gloucester.

Sunday, July 17—Gloucester to Isles of Shoals.

Monday, July 18—Isles of Shoals to Peaks Island.

Tuesday, July 19—Peaks Island to Boothbay.

Wednesday, July 20—Boothbay to Islesboro.

Thursday, July 21—At Islesboro, or elsewhere, as may be decided at a captains' meeting after the beginning of the cruise.

Friday, July 22—Islesboro to Bass Harbor.

Saturday, July 23—Bass Harbor to Bar Harbor.

Sunday, July 24—At Bar Harbor.

Monday, July 25—Eastern Y. C. regatta at Bar Harbor. Fleet will disband.

Suitable prizes will be awarded to winning yachts in port-to-port runs in classes specified by the regatta committee.

The regatta committee of the Quincy Y. C. has announced the following fixtures for the season:

June 4, Saturday—Club race.

June 16, Thursday—Interclub race at Wollaston.

June 25, Saturday—Interclub race at Squantum.

July 4, Monday—Club race.

July 16, Saturday—Interclub race at Quincy.

July 29, Friday—Y. R. A. open.

July 30, Saturday—Club race.

Aug. 6, Saturday—Club race.

Aug. 20, Saturday—Club race.

Sept. 5, Monday—Club race.

It has been announced that the Corinthian Y. C., of Marblehead, will take charge of the race from Marblehead to the Isles of Shoals and return on June 25. Three classes have been provided, as follows:

Class A, handicap—Yachts 30ft. and under 50ft. waterline. Cup offered by Mr. Lawrence F. Percival.

Class B, handicap—Yachts under 30ft. waterline. Cup offered by Mr. Henry A. Morss.

Class C, 22-footers. Cup offered by Mr. H. H. Walker.

In addition to the cups offered cash prizes will be given in each class. The race will be started off the Corinthian club house at 8 on the evening of June 25. The boats will proceed to the bell buoy off White Island, passing outside of Thatcher's Island and the Salvages, and return. H. S. Goodwin, Marblehead, is chairman of the committee.

Mr. Lawrence Percival has announced that he will put Sally VII. in commission this season. In this case it is more than likely that Early Dawn III., owned by ex-Com. J. E. Doherty, of the Columbia Y. C., will also be in the racing field. It is quite probable that clubs holding open races will provide a class for these boats.

Wilson & Silsby have received orders for new sails for the following yachts: Thirty-footer designed by Will Fife, of Fairlie, for Finland; 35-footer Ranger, H. P. King; 25-footer Kalama III., David Rice; suits for 10 Bay State dories; 70ft. schooner Seneca, R. A. Rainey; 30-footer Sauquoit, T. K. Lothrop, Jr.; schooner Emerald, W. E. Iselin; 60-rater Weetamose, H. F. Lippitt; 25-footer, Richard Stone; 21-footer for J. M. Zurn, of Philadelphia; 18-footer for C. H. W. Foster; 18-footer for L. B. Goodspeed; 22-footer for C. H. Davis; 18-footer for H. M. Jones; 70-foot schooner Katrina, J. B. Ford; 19 suits for White Bear Lake, for 17 to 20-footers; 4 suits for Seawanhaka cup boats; 22-footer Urchin, John Greenough; 35-footer Umbrina, W. H. Childs; 71ft. schooner building for H. C. Tinker, of New York; schooner Corona (ex Colonia), A. F. Luke; 10 suits for Northaven centerboard class; sloop Petrel, R. H. Dorby; yawl Petrel, H. V. R. Kennedy; steam yacht Anona, Paul Rainey; 22-footer Tayac, W. H. Joyce. They have also orders to furnish about 20 suits of sails for export, including Finland, Sweden, Durban, Natal, Sidney, Germany and Italy.

A joint meeting of the Lake Winnepesaukee Y. C. and the Kingswood club, of Lake Winnepesaukee, was held at the New Hampshire Exchange Club last week, at which ways and means for improving Lake Winnepesaukee were discussed. Ex-Gov. Rollins, of New Hampshire, and Dr. C. W. Bray, commodore of the Portland Y. C., were guests.

Announcement of the fixtures of the Wollaston Y. C. for the season of 1904 by the regatta committee, published in pamphlet form, has been made as follows:

May 30, Monday—Club championship.

June 4, Saturday—Hardy cup.

June 17, Friday—Interclub race, at Wollaston.

July 2, Saturday—Interclub race at Squantum.

July 4, Monday—Club championship.

July 9, Saturday—Interclub race at Quincy.

July 27, Wednesday—Moonlight sail.

July 30, Saturday—Hardy cup.

Aug. 6, Saturday—Clambake.

Aug. 13, Saturday—Club championship.

Aug. 20, Saturday—Hardy cup.

Aug. 25, Thursday—Moonlight sail.

Sept. 3, 4 and 5, Saturday, Sunday and Monday—Club cruise.

The Cohasset Y. C. has elected the following officers: Com., D. N. Tower; Vice-Com., Alanson Bigelow; Secretary-Treasurer, G. W. Collier; executive committee, L. G. Willcutt, C. H. Cousens, A. A. Barron, C. W. Gammons and F. R. Pegran; house committee H. B. Cousens, F. N. Ridley and D. C. Tower; regatta committee, B. R. Williams, F. J. Moore, W. R. Sears and James Dean; membership committee, J. N. Willcutt, S. C. Bates, F. R. Nichols, Odin Towle and C. H. Tower.

Murray & Tregurtha have finished a 22ft. launch for William Whytal & Son, of Arlington. The 35ft. launch for G. H. Prior, of Winthrop, was launched last Thursday and showed up well on her trial trip. The 30ft. launch Talisman was launched last Monday and had a trial trip to Marblehead and return. The same firm have

sold a launch owned by E. W. Burdett to John M. Devine.

T. K. Lothrop Jr.'s 30-footer Sauquoit, designed by Burgess & Packard, the first boat in the class recently adopted by the Y. R. A. of M. to be completed, was launched at Salem last Thursday afternoon. The Sauquoit is 48ft. over all, 30ft. waterline, 10ft. 2in. beam and 6ft. draft. She will carry 1,200 feet of sail.

The steam yacht Jule, designed by Mr. Fred D. Lawley, and built by the Lawley Co. for Com. B. P. Cheney, of the Boston Y. C., was launched at the yard of her builders last Saturday. The Jule was christened by Mrs. B. P. Cheney as she started down the ways. Com. Cheney will use the Jule as a ferry between the Boston and City Point anchorages of the Boston Y. C. and his summer estate on Brewster Island.

JOHN B. KILLEEN.

## Southern Letter.

IN the hundred-mile stretch between Mobile and New Orleans there are now seven yacht clubs, and the banding of these seven sisters into a yacht racing union three years ago has had a most beneficial effect upon the destinies of the sport, and in the use of uniform classification and racing rules and of an interchange of entries and participation in the events of all there is made possible a regular yacht racing "circuit," a novelty in its way, which extends from one end of the line to the other, starting on the Fourth of July every year and upon succeeding Saturdays, touching at place to place until each club has had its turn, the combined fleet moving from course to course as one. The affairs of the Southern Gulf Coast Yachting Association are in the hands of the right men, yachtsmen who are progressive and aggressive, and it is fair to assume that it will one day make its brightness felt in the yachting world, and there is already that in the combined strength of these seven strong clubs other than a similarity of numbers which presages a veritable pleiads in the yachting firmament.

The first step toward laying a foundation for a substantial organizing of yachting along this arm of old ocean was to adopt a racing rule that, while being entirely satisfactory to all and well adapted to the conditions prevailing, would give, from its very simplicity, no hindrance to the advancement of the sport along healthful lines, and which would permit of the encouraging of certain desirable classes prevailing in other parts of the country. The idea was to place for the cabin classes the needful safeguards against machines and freaks, not in a racing rule of much complication; sail area only is measured; but in the classification and in restrictions on scantlings and on extreme over all lengths. The saving grace of the whole business was in the rule giving to the race committee the power to finally designate a boat's class; "model" or "special," freaks or machines being included in the latter. There was a well defined object in view of not attempting to encourage too many classes, but to try and build up about three divisions of model racing cabin sloops. A class conforming to the size of the 25-footers of the Y. R. A. of Mass., a second class of about the size of 21 and 22-footers of the same association, for the third a one design class of 20ft. centerboard knockabouts; and the fourth class to be left open to freaks and machines of smaller size and 500sq.ft. sail area, there being room here for a class of this kind, the waters being warm and shallow. Recruits for the two larger classes of cabin sloops could be purchased in the big yachting centers which would conform to the restrictions, and the freak class mentioned is on the lines of the Seawanhaka Cup boats and of the "Class A" racers of the Inland Lake Yachting Ass'n. This latter class is growing rapidly. There are half a dozen fast boats here of local production, one designed by Crane and one by Mower, and last year a crack Northern machine was brought down, and now there are two of the fastest boats of the Inland Lake class on their way here. By next year it is hoped that the South will have boats of the class capable of entering the above international and inter-association contests with some reasonable chance of making a good showing. The outlook for the cabin classes is very encouraging, a number of boats being built here, and at least four having already been purchased in the North, all these being well and favorably known as racing-cruisers of the better type, such as Calypso, now enrolled in the Southern Y. C.

The racing rule used here was printed in FOREST AND STREAM, Jan. 31, 1903. It was thoroughly tried last year and all the clubs in the association are heartily in favor of it, as it seems to be entirely suited to the conditions and the plans for the future, which is all that is desired of the rule. The annual meetings of the other clubs of the association will all have taken place by the first of next month, when the season can be said to be in full swing, and then for the annual regattas of May and June, the racing circuit of July and part of August, after which the cup races, private matches, and then the closing regattas of early fall, and every Saturday of the long, breezy summer is accounted for. The fall and winter is left for cruising, and later some organization will be attempted for this part of the sport, and it is seen right now that if the South don't have a couple of hundred mile cruising races before the year is over it will still be behind the times. There could not be a better course than along the open Gulf from New Orleans to Mobile and back.

No matter how strong are the efforts being made to foster the sailboat fleet, just as effective measures are being taken to encourage the motor boat arm of the clubs of the Southern Gulf Coast Yachting Ass'n, and it will be a toss up which makes the best showing for the season.

The first of this series of "Southern letters" had to do with the conditions afforded for yachting along this corner of the Mexican Gulf coast, the second with the particulars of the sport at New Orleans and with the Southern Y. C. in particular, and this of current issue contains some of both, with a little on the perennial subject of "Racing Rule" thrown in for lagniappe. It is to be hoped that the next may deal with the real actualities of a busy season.

L. D. SAMPSELL.

## British Letter.

ACCORDING to the latest rumors received over here in connection with Sir Thomas Lipton's contemplated challenge for the America's Cup, the negotiations appear to be at a standstill. One thing is perfectly clear, and that is no British yachtsman will issue another challenge if the boats are to race under the old American rating rule.

Most of the fixtures of the big clubs are now published. The season proper commences, as usual, with the London River matches of the three principal metropolitan clubs—the Royal Thames, Royal London and New Thames—and the regatta of the Royal Harwich Y. C. For a great number of years the London River matches were started from Gravesend, but the increase in the shipping traffic and the general unsuitability of the course up Sea Beach and into Gravesend have caused the clubs to strike out a new line the last two or three years, and a far more suitable course has been mapped out from Southend, which, besides being down below the narrow reaches of the river, has the advantage of being quadrilateral, instead of merely straightaway and back. There was a certain amount of opposition from the older members when the new course was suggested, as it quite upset old time-honored customs, but modern ideas prevailed and the boats have now as fair a course as it is possible to get on tidal waters, whereas in the old days it was quite a frequent occurrence to see a boat which had been hopelessly beaten all day come drifting up Gravesend Beach on the first of the flood and save her time from the leaders, which had been hung up in the narrows near the finishing-line on the last of the ebb. This, of course, destroyed much of the interest of the races, but that is now fortunately a thing of the past, and the course from Southend Pier, round the Nore Lightship, West Oaze Buoy and Mouse Lightship has given universal satisfaction. The Royal Thames matches from the Nore to Dover on June 11 take the racing fleet away from the Thames, and after the regatta of the Royal Cinque Ports Y. C., on June 13, there will be a lull until the commencement of the Clyde Fortnight on the last day of the month.

The prospects for the Clyde regattas are not very bright. For some years the German regattas have proved sufficiently attractive to draw many British yachts to Kiel, and as the "Kiel Week" has now developed into a fortnight and takes place during the latter half of June, yacht owners have to make up their minds which function they will attend, Clyde or Kiel, as it is impossible to do both. It cannot be denied that in some respects Kiel has the pull, for the boats which go there can take part in the race from Dover to Heligoland, which starts a week after the Nore to Dover races of the Royal Thames Y. C., and only a few days after the Royal Cinque Ports June regatta, and they are, so to speak, on the spot. For some years, therefore, the German regattas have seriously interfered with Clyde fixtures, for in the absence of first-class racing and the 65-footers the presence of the big handicap boats is much to be desired, though it is very doubtful if many of them will be seen on the Clyde. It seems strange that the once brilliant series of regattas, familiarly known as the Clyde Fortnight, should be dependent upon the 52ft. class for their chief attraction. Such, however, was the case last year, and there is at present no reason to suppose that a better fate awaits them this season unless owners in the handicap class come to the rescue.

Mr. Cecil Quentin's handsome Fife schooner will not fit out this year, so if Ingomar comes over she will not find any British schooner fit to give her a run. If she goes to Kiel she will have good boats to sail against, but, although the Watson designed Hamburg—ex-Rainbow—and the new Fife schooner building for Germany, would possibly be worthy of her caliber if properly handled, they will be no match for her with German skippers and crews, and the German Emperor's Meteor is such a ship that she requires something like half a gale to warm her up. There is once more talk of Mr. Kenneth Clark fitting out Kariad now that he has sold his steam yacht, Katoomba, but nothing definite has transpired, and it seems unlikely on the face of it that Kariad will hoist racing colors unless she goes into the handicap class.

A burning question among small yacht owners on the Clyde is what is to become of the 23-30ft. length class, which has collapsed owing to the formation of the new restricted class. In all probability they will be compelled to join the already overfilled ranks of the four old rating class unless, as Mr. J. A. Leckie, the owner of Cymbeline, suggests, they be formed into a limited handicap class. This idea is well worth following out, as the form of the boats is pretty well known, and much sport should result from a form of handicapping which has been tried in other classes with excellent results.

E. H. KELLY.

## Eastern Y. C.'s Proposed Invitation Ocean Race.

NEW YORK TO MARBLEHEAD (ABOUT 325 NAUTICAL MILES), FOR YACHTS 30 FEET AND NOT OVER 50 FEET WATERLINE, DURING THE SECOND WEEK IN JULY, 1904.

Prizes.—Silver cups to be awarded in each class according to the number of starters.

In addition a suitable trophy to be awarded to each yacht completing the course, but not winning a prize.

Classes.—Classes D and E.—All schooners not over 64ft. rating measurement.

Class I.—Sloops and yawls not over 64ft. and over 51ft. rating measurement.

Classes C, J and K.—Sloops and yawls not over 51ft. rating measurement and not less than 30ft. load waterline.

Note.—Other classes may be added in the discretion of the committee.

Course.—Start from some point in New York Bay to be announced later.

Finish to be between Marblehead Rock and Cat Island. As the time of finish is very uncertain, each yacht will be required to take her own time when the monument on Marblehead Rock bears W.S.W.

Course.—Leave Sandy Hook Lightship and South Shoal Lightship on port. Each yacht must pass near enough to the South Shoal Lightship to be identified and reported by wireless. Each yacht to be furnished with

day and night signals showing her number for identification. Yachts to be requested to show their numbers if they pass near enough to Highland Light to be made out.

**Measurements and Rules.**—All yachts to be rated according to rules of measurement of the Eastern and New York Yacht clubs, and allowances to be figured from the rating according to the table of allowances of the Eastern Y. C. No restrictions on sails or crew, except that club topsails would not be allowed. The race to be sailed under the racing rules of the Eastern Y. C., except as they may be modified especially for this race, such modifications to be noted in printed instructions.

It is believed that this race would be a test of seamanship and the weatherly qualities of yachts rather than of speed, and it is hoped that many men who do not care for ordinary racing, but who own staunch, able cruising yachts, will take an interest in the race, and those owning such yachts are urged to enter their yachts for the race.

In order to make arrangements for the race, the committee must have a definite knowledge of the probable number of starters; therefore all owners interested are requested to send in their names as soon as possible, even if they are not sure at the present time that they could start.

**Privileges.**—Privileges of the floats and club house of the Eastern Y. C. at Marblehead would be extended to captains and guests of yachts participating in the race.

The annual regatta of the Eastern Y. C. will be held off Marblehead, Friday, July 15, and the club squadron will start on its annual cruise from Marblehead to Bar Harbor on Saturday, July 16. All yachts sailing in the ocean race will be invited to enter the annual regatta, and also to join the squadron on the cruise and compete for the prizes in the runs from port to port.

For further information apply to Henry A. Morss, 110 State street, Boston, Mass., secretary special ocean race committee.

HENRY HOWARD, Chairman,  
GEORGE ATKINSON, JR.,  
S. W. SLEEPER,  
LOUIS M. CLARK, Secretary,  
Regatta Committee.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

**SOUTHERN ELECTS OFFICERS.**—The Southern Y. C., of New Orleans, held its fifty-fifth annual meeting a short time ago and the following officers were elected: Com., Albert Baldwin; Vice-Com., A. M. Cooke; Rear-Com., L. K. Nicholson; Treas., J. J. Hooper; Sec., L. D. Sampson; Fleet Surgeon, Dr. R. L. Riley; Measurer, Holmes Harrison; Governing Committee: A. H. Clement, P. F. Donnes, Jr., T. D. Miller, S. F. Heaslip, D. H. Holmes.

**COM. MORTON F. PLANT SELLS "SLOOP NELLIE."**—Mr. Henry F. Parmelee, New Haven, Conn., has purchased the sloop yacht Nellie from Com. Morton F. Plant, through Mr. Stanley M. Seaman. She was designed by N. G. Herreshoff and built in 1903 by Herreshoff Mfg. Co. She is 52ft. over all, 36ft. waterline, 13ft. beam, 7ft. 6in. draft. The same agency has also sold the cruising catboat Jolly Roger to Dr. Mary H. Cotton, this city, for Mr. J. Wheeler Mallaby, Port Chester, N. Y.

**NEW ROCHELLE Y. C. FIXTURES.**—The regatta committee of the New Rochelle Y. C. has arranged for the following races: May 28, spring regatta; June 18, power boat race; July 2, annual regatta; July 30, club race; Aug. 6, ladies' race; Aug. 27, club race; Sept. 3, 4 and 5, club cruise, and Sept. 10, club race.

**UNQUA CORINTHIAN Y. C.**—At a recent meeting of the Unqua Corinthian Y. C. the following officers were elected: Com., Delancey T. Smith; Vice-Com., Francis Williams; Treas., Marshall Woodman; Sec., George F. Booth. Regatta, R. Blecker, Charles F. Hart, R. J. Ireland. Entertainment, W. A. Critter, E. S. Wingate and William Tuervy. House Committee, Edward Blecker, William Blecker, F. B. Dalzell, E. P. Foster and J. H. Ruwe.

The opening regatta will be held on May 30.

**LAURITA CHARTERED.**—The steam yacht Laurita, owned by Mr. George J. Smith, has been chartered through the agency of Mr. Frank Bowne Jones, of this city, to Com. George G. Tyson, Riverside Y. C.

**YACHTS AT ST. LOUIS.**—The officials in charge of the exposition at St. Louis have arranged matters so that yachts, launches and houseboats have been granted free wharfage space along the river front at St. Louis during the World's Fair. The concession lasts during the seven months of the exposition. The circular reads in part as follows:

"Yachts and steam launches—Yachts, steam launches and all boats propelled by their own power will be assigned wharf space between Chouteau avenue on the south and Biddle street on the north. No charge will be made for wharfage.

"Houseboats—Houseboats will be assigned wharf space north of Biddle street, and also south of Chouteau avenue. No charge will be made for wharfage.

"Application for wharf space—Application for wharf space should be made to Joseph P. Whyte, harbor and wharf commissioner, City Hall, St. Louis.

"Telephone service—Free telephone service will be furnished to visitors at the harbor, office, foot of Market street."

**SCAT SINKS AT SAN REMO.**—The Scawanhaka one design 15-footer Scat, owned by Col. Francis L. Leland, was capsized at San Remo, Italy, in a squall and sunk. Those on board were rescued by a boat from the Italian battle-ship Lepanto.

**COM. LYON BUYS THE STELLAR.**—The steam yacht Stellar, formerly owned by Mr. Truman Beckwith, of Providence, R. I., has been sold, through the agency of Henry J. Gielow, to Rear-Com. Whitney Lyon, of the Columbia Y. C.

**HARTFORD Y. C.'S OCEAN RACE.**—At a meeting of the Hartford Y. C., held at Hartford, Conn., on April 13, it was voted to have an ocean race open to yachts enrolled in the clubs of the Yacht Racing Association of Long Island Sound. There will be classes for boats of 36 feet and less in length over all and for boats of from 36 to 50 feet over all.

The competing yachts will sail in cruising trim. The course will be from the Fenwick Station of the club at the mouth of the Connecticut River around Block Island and return. The date and conditions will be announced later. Substantial prizes will be awarded to the winners.

**RACING SCHEDULE OF THE Y. R. A. OF GRAVESEND BAY.**—A meeting of the Yacht Racing Ass'n of Gravesend Bay was held in Brooklyn on the evening of April 23, and the following dates for special events were decided upon:

June 4—New York C. C.; spring annual.  
June 14—Atlantic Y. C.; annual.  
June 18—Marine and Field Club; annual.  
June 25—Brooklyn Y. C.; first championship.  
July 9—Bensonhurst Y. C.; annual club races.  
July 16—Bensonhurst Y. C.; second championship.  
July 30—Marine and Field Club; third championship.  
Aug. 13—Brooklyn Y. C.; club regatta.  
Aug. 20—Atlantic Y. C.; fourth championship.  
Aug. 27—New York C. C.; fall regatta.  
Sept. 5—Atlantic Y. C.; club regatta.  
Sept. 10—Bensonhurst Y. C.; open handicap.  
Sept. 17—New York C. C.; fifth championship.

**STEAM YACHT ROXANA REACHES NEW YORK.**—Mr. John W. Gates' steam yacht Roxana reached New York on April 10 from Chicago. She made the trip via the Mississippi River route. Roxana was built in the West last year.

**WEST END Y. C.**—The West End Y. C. elected the following officers on April 13, and the installation will be held at the club house on April 27, at 9 P. M. Com., John Fleming; Vice-Com., Fred Gegges; Fin. Sec., John Meyers; Cor. Sec., Wm. Ridley; Treas., Andrew Marshall; Steward, Adam Marshall; Meas., L. Ridley; Fleet Capt., Howard Lawson; Fleet Surgeon, David Garrick; Trustees, Philip Grauer, John Dalton, H. Grueling, John Homam.

**BRITISH YACHT SYBARITA PURCHASED BY W. GOULD BROKAW.**—Mr. W. Gould Brokaw, N. Y. Y. C., has purchased the famous English yawl, Sybarita, from Mr. M. B. Kennedy. Sybarita was designed by G. L. Watson and built by D. & W. Henderson, Glasgow, in 1900. Mr. Brokaw will race Sybarita in the British and German regattas this season.

## Answers to Correspondents.

No notice taken of anonymous communications.

Subscriber, Reading Terminal, Philadelphia.—Will you inform me whether what is called a king rail is the same species as the bird called a mud hen; if not, will you kindly describe each, male and female, pointing out the differences? The question from the commoner standpoint is that the king rail is the same as the mud hen. Ans. The question is one difficult to answer. In different parts of the country these two English names may be applied to two very different birds. "King rail," as the term is usually understood in books and by ornithologists, is a large long-billed bird belonging to the genus *Rallus*. It is brown above, striped with brownish black, changing to reddish brown on the sides, with the brownish or dusky flanks barred with white. Its length is from 17 to 19 inches, and the bill measures from 2 1/2 to 3 inches. It is usually found in fresh-water marshes. What is commonly called "mud hen" belongs to the genus *Fulica*, the coots. It is uniformly slaty or plumbeous in color, the head and neck darker, nearly black; the bill whitish with a frontal shield, which is dark brown in summer, running from the bill on to the forehead. It may be known as by having the toes lobed; that is to say, with flaps of scaly skin on either side the toe, which form a partial webbing. This is the bird commonly called mud hen. It has many other names, as sea crow, crow-billed duck, flusterer, blue-peter, and so on. It may be known always by the toes and the frontal shield. We have heard the Florida gallinule called "king rail," and mud hen is a term that is often applied to rail of various species. Compare Trumbull "Names and Portraits of Birds which Interest Gunners."

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

### Fixtures.

April 26-29.—Kansas City.—Spring target tournament at Blue River Park. R. S. Elliott, Mgr.  
April 27-28.—Americus, Ga.—The Interstate Association's tournament, under the auspices of the Americus Gun Club. H. S. McClesky, Sec'y.  
April 30.—Princeton, N. J.—Team shoot: Princeton University vs. Crescent Athletic Club, of New York.  
May 3-4.—Wabash, Ind., Gun Club tournament. Austin Flynn, Sec'y.  
May 3-4.—Derry, Pa., Rod and Gun Club.  
May 3-5.—Junction City, Kans.—Kansas State Sportsmen's Association annual tournament. E. L. Wetzig, Sec'y.  
May 4-5.—Rochester, N. Y., Rod and Gun Club spring tournament.  
May 4-5.—Nashville, Tenn.—The Interstate Association's tournament, under the auspices of the Cumberland Park Driving Club. Charles Eastman, Sec'y.  
May 7.—New Haven, Conn.—Intercollegiate shoot.  
May 11-12.—Springfield, O., Gun Club's target tournament. Geo. Morgan, Sec'y.  
May 11-13.—Spirit Lake, Ia.—Iowa State Sportsmen's Association tournament. J. Burmister, Sec'y.  
May 12-13.—Wilmington, Del.—Wawaset Gun Club annual spring tournament. W. W. Foord, Sec'y.  
May 16-18.—Southern Trapshooters' Association's thirteenth tournament at targets, under auspices of Vicksburg, Miss., Gun Club; \$500 added. J. J. Bradfield, Sec'y.  
May 16-21.—York, Pa.—Tournament of Pennsylvania State Sportsmen's Association, under auspices of York City Gun Club. N. M. McSherry, Sec'y.  
May 17-18.—Dubuque, Ia.—Gun Club's fifth annual amateur target tournament. A. F. Heeb, Cor. Sec'y.

May 17-19.—Davenport, Ia.—Cumberland Gun Club's annual amateur tournament. W. F. Kroy, Sec'y.  
May 18.—Boston, Mass., Gun Club annual team target shoot. H. Kirkwood, Sec'y, 23 Elm street, Boston.  
May 18-19.—Auburn, N. Y., Gun Club tournament. Jos. H. Knapp, Mgr.  
May 18-20.—Columbus, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament. G. A. Schroeder, Sec'y.  
May 19-20.—Oklahoma City.—Territorial Sportsmen's Association fifth annual tournament; \$300 added money. J. C. Clark, Sec'y.  
May 19-21.—Minneapolis, Minn., Gun Club handicap target tournament. Fred E. McKay, Sec'y and Mgr.  
May 20.—Charlotte, N. C., Gun Club tournament.  
May 21.—Princeton, N. J.—Princeton University vs. University of Pennsylvania.  
May 23-25.—Houston, Tex.—Texas State Sportsmen's Association tournament.  
May 24-25.—Marshalltown, Ia., Gun Club two-day target tournament.  
May 24-25.—Olean, N. Y., Gun Club two-day tournament. B. D. Nobles, Sec'y.  
May 24-25.—Natchitoches, La., Gun Club tournament.  
May 24-25.—Mt. Sterling, Ky.—Kentucky Trapshooters' League tournament. Frank Prago, Sec'y, Louisville, Ky.  
May 25-26.—Brownsville, Pa., Rod and Gun Club.  
May 25-26.—Shamokin, Pa., Gun Club Spring shoot. S. C. Yocum, Sec'y.  
May 28-30.—Butte, Mont.—Montana State Sportsmen's Association eleventh annual tournament at targets; \$500 added. C. H. Smith, Sec'y.  
May 30.—Utica, N. Y.—Riverside Gun Club all-day target tournament; free merchandise prizes. E. J. Loughlin, Sec'y.  
May 30.—Newport, R. I.—Aquidneck Gun Club's third annual tournament. J. S. Coggeshall, Secretary, Box 9, Newport, R. I.  
May 30.—Albany, N. Y.—West End Gun Club tournament. H. H. Valentine, Sec'y.  
May 30.—Detroit, Mich.—Winchester Gun Club fourth annual Decoration Day tournament. T. M. Brodie, Sec'y.  
May 30-31.—Norristown, Pa.—Penn Gun Club holiday shoot. A. B. Parker, Sec'y.  
May 30.—McKeesport, Pa.—Spring tournament of the Enterprise Gun Club. Geo. W. Mains, Sec'y.  
May 30.—Ossining, N. Y., Gun Club Decoration Day target shoot. C. G. Blandford, Capt.  
May 31.—Dayton, O.—Kohrer Island Gun Club spring target tournament. W. E. Kette, Sec'y.  
June 1-3.—Watertown, S. D.—South Dakota State Sportsmen's Association tournament. F. J. Cory, Sec'y.  
June 7-8.—Ligonier, Pa., Rod and Gun Club.  
June 7-9.—Sioux City, Ia.—Soo Gun Club's tenth annual amateur tournament; added money. W. F. Duncan, Sec'y.  
June 8-10.—Huntington, W. Va.—West Virginia State Shoot. F. H. Merrick, Sec'y.  
June 9.—Westchester, Pa., Gun Club target shoot. F. H. Eachus, Sec'y.  
June 13.—Middleton, Wis., Gun Club tournament. Frank L. Pierstorff, Mgr.  
June 14-15.—Wilkes Barre, Pa.—Hanover Park Shooting Association target tournament. E. L. Kipple, Sec'y.  
June 14-16.—Akron, O.—Ohio Trapshooters' League target tournament. G. E. Wagoner, Sec'y.  
June 14-16.—New London, Ia., Gun Club midsummer tournament. Dr. C. E. Cook, Sec'y.  
June 14-17.—Warm Springs, Ga.—Target and live-bird tournament. Chas. L. Davis, Mgr.  
June 15-16.—Battle Creek, Mich.—Tournament of the Michigan State Trapshooters' League. L. K. Forsythe, Sec'y.  
June 15-16.—Millvale, Pa., Rod and Gun Club.  
June 15-17.—Lincoln, Ill.—Illinois State Sportsmen's Association tournament. James Davis, Sec'y.  
June 21-24.—Indianapolis, Ind.—The Interstate Association's fifth Grand American Handicap at targets. One thousand dollars added to the purses. Elmer E. Shaner, Secretary-Manager, 219 Coltart Square, Pittsburg, Pa.  
June 27-July 2.—French Lick Springs, Ind.—Tournament of the National Gun Club. \$500 added money. John M. Lilly, Pres., Indianapolis.  
July 4.—Brunswick, Me., Gun Club all-day target tournament. G. M. Wheeler, Sec'y.  
July 4.—Richmond, Va.—East End Gun Club annual merchandise shoot. J. A. Anderson, Sec'y.  
July 4-6.—Winona, Minn.—The Interstate Association's tournament, under the auspices of the Winona Sportsmen's Club. Oswald Leicht, Sec'y.  
July 6-7.—Kane, Pa., Rod and Gun Club.  
July 8-9.—Wausau, Wis.—Wisconsin League of Gun Clubs' State tournament. H. G. McCrossen, Sec'y.  
July 12-14.—St. Paul, Minn., Rod and Gun Club amateur handicap tournament. J. L. D. Morrison, Sec'y-Mgr.  
July 13-14.—Scottsdale, Pa., Rod and Gun Club.  
July 19-20.—Shamokin, Pa., Gun Club midsummer shoot. S. C. Yocum, Sec'y.  
July 19-22.—Cincinnati, O., Gun Club annual handicap.  
July 27-28.—Grand Forks, N. D.—The Interstate Association's tournament, under the auspices of the Grand Forks Gun Club. W. M. Ferguson, Sec'y.  
Aug. 9-12.—West Baden, Ind.—Indian tournament; \$1,000 added money.  
Aug. 10-12.—Brantford, Ont.—Dominion of Canada Trapshooting and Game Protective Association's fourth annual tournament. A. B. Cutcliffe, Sec'y.  
Aug. 15-20.—Buffalo, N. Y.—New York State shoot.  
Aug. 24-25.—Hot Springs, S. D.—The Interstate Association's tournament, under the auspices of the Hot Springs Gun Club. H. A. Gayhart, Sec'y.  
Aug. 25-26.—Tarentum, Pa., Rod and Gun Club.  
Sept. 5.—Springfield, Mass.—Fall tournament on Labor Day; \$25 added. C. L. Kites, Sec'y.  
\*Western Pennsylvania Trapshooters' League tournaments. C. G. Grubb, Sec'y, Pittsburg.

## DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The next shoot of the Brunswick, Me., Gun Club, on the afternoon of May 19, at the Merry Meeting grounds.

June 9 has been fixed upon by the Westchester, Pa., Gun Club as a date for a target tournament. Mr. F. H. Eachus is the secretary.

Schenectady collocated Poughkeepsie and Ossining. In the recent team matches at Poughkeepsie, April 23, Schenectady defeated the Poughkeepsie team by 35 and the Ossining team by 47 points.

There was a large attendance at the shoot of the Trenton, N. J., Shooting Association. About forty shooters participated. Mr. "Jenks" Taylor was high man in the averages, with the excellent total of 157 out of 165. Mr. Lew Emann was second with 155.

At the shoot held by the South Side Gun Club, of Newark, N. J., on Saturday of last week, the first of the series for an automobile, there were eighteen entries. Mr. Chas. W. Floyd, one of New York's most expert shooters, won with a score of 91 out of 100.

Mr. J. A. R. Elliott, one of the most renowned expert shooters, of the Winchester Repeating Arms Co., tarried a while in New York on Monday of this week. He journeyed in the afternoon toward Pittsburg to attend the tournament of the Herron Hill Gun Club.

The managers, Messrs. Knox and Knapp, write us as follows: "The programme of the Auburn, N. Y., tournament, May 18 and 19, will be very attractive. Two nice hammerless guns will be the prizes in the merchandise events. Entrance \$1.50. Targets included at 1½ cent. Liberal added money and a good time for all. Programmes sent out May 1."

Messrs. J. S. Wright, of New York, and T. E. Batten, of Elizabeth, N. J., have signed an agreement to shoot a match at 100 targets, play or pay, on some day before May 1 next. The contest is to take place on the grounds of the Brooklyn Gun Club. The indications at present are that the match really will be shot, but the indications are not immutable.

The programme of the Ossining, N. Y., Gun Club for their Decoration Day shoot, May 30, provides seven events, three at 15, four at 25 targets, entrance \$1.30 and \$2; totals, 145 targets, \$11.90 entrance. Shooters may enter for targets only. Average moneys, \$5 and \$3. Competition begins at 11 o'clock rain or shine. A trophy will be given the contestant breaking high in the last 100 targets. Mr. C. G. Blandford is the captain.

The system of handicapping which will obtain at the tournament of the Wawaset Gun Club, May 12-13, is as follows: All known 90 per cent. men will stand at 19yds.; 85 to 89 per cent. men at 18yds.; all others 16yds. Thereafter handicaps are imposed according to place, thus winners of first go to 20yds.; of second, 19yds.; of third, 18yds.; of fourth, 17yds.; all others, 16yds. Targets 2 cents. May 11 will be practice day. Rose system, 5, 3, 2 and 1. Send guns and ammunition prepaid to Mr. E. Melchior, 214 King street, Wilmington, and he will deliver them on the grounds free.

The following, taken from the Shooting Times, clearly shows that one's degree of youthful skill and vigor is not necessarily measured by one's years. It also shows that there are some active old boys, keen of eye and sure of hand, in other lands than the United States: "At a pigeon shoot at the Cross Keys some days ago, Mr. J. Knott, a well-known Bathonian, who is now in his eighty-fifth year, divided two out of four sweepstakes. Previous to Saturday he had not shot for three years, and yet managed to kill 10 out of his first 11 birds, and altogether 11 out of 14. There is evidently life in the old dog yet."

The programme of the Shamokin, Pa., Gun Club tournament, to be held on May 25-26, provides twelve events each day, one at 10, the remainder at 15 targets, 50 cents, 75 cents, \$1 and \$1.50 entrance. Totals each day, 175 targets, \$12 entrance. There also is a professional shoot, 25 targets, entrance \$2.50, with \$5 added. And a five-man team shoot, 125 targets per team, entrance per team, \$2.50. To first high team, \$15; to second \$10. Guns and ammunition prepaid and sent to S. C. Yocum, will be delivered on the grounds free of charge. Refreshments and ammunition obtainable on the grounds. Professionals may daily for targets only.

The midwinter tournament given by J. F. Schmelzer & Son's Arms Co., Kansas City, Mo., April 18-22, was a distinct success. Some shooting performances were near the perfect degree of excellence. Mr. Chan Powers was high on the first day, with 192 out of 200. Mr. W. H. Heer on the second day was high with 195 out of 200. On the third day Messrs. Gilbert and Crosby tied on \$1 out of 100. Mr. Heer won professional high average with 473 out of 500. Mr. Chan Powers won amateur high average with 466. The Kansas team won the trophy for the team making the best scores during the series of tournaments. Mr. C. Dixon, of Joplin, won the Individual trophy. The Individual Schmelzer trophy was won by Mr. Russell Klein with 48. The individual championship, 25 live birds, thirty-five entries, was won with a straight score by Mr. John Wilmot, of Lexington, Ky.

A correspondent informs us that "a race is contemplated between teams representing the Country Club of Wilmington, Del., and the Wawaset Gun Club of the same city. Among those who will represent the Country Club are Messrs. Eugene duPont, Alexis I. duPont, Victor duPont II., Victor duPont III. and J. T. Skelly. Mr. Eugene duPont is one of the best shots in the club, and at present holds the R. E. championship. For the Wawasets, Mr. W. M. Foord, Luther J. Squier, J. A. McKelvey, Lester German, Edward Banks and others will be found at the score. The first shoot will be held in the near future, and will be in the nature of practice work for the Wawasets' annual tournament, which will be held in Wilmington May 12 and 13 next. By the way, anybody wishing a programme of that tournament can get one by applying to W. M. Foord, 213 West Sixth street, Wilmington, Del."

BERNARD WATERS.

#### Independent Gun, Rifle and Pistol Club.

EASTON, Pa., April 21.—With a raw wind blowing across the trap and the erratic flight of the bluerocks, twenty-six shooters, professionals and amateurs, faced the northwest and shot "holes in the air."

The three cash amateur prizes given by the club were won, after a hard fight, by O. Skeds with 156 breaks out of 180 targets; J. Pleiss with 151 breaks out of 180 targets, and E. F. Markley with 150 breaks out of 180 targets. The highest professional score was made by J. M. Hawkins with 159 breaks out of 180 targets. The professionals and trade representatives present were as follows: Sim Glover, J. M. Hawkins, Mr. Overbaugh, M. L. Herbein, F. E. Butler, and last but not least, the always cheerful and "friend maker," T. H. Keller.

T. H., not arriving on the grounds until after the tournament was started, decided to show all the boys that the "has been," as he called himself, could shoot a little, and made one of the three straight scores made in any event by any of the shooters.

Messrs. Glover and Hawkins both claimed to be under the weather, but yet, with the conditions taken into considerations, shot like old veterans.

Messrs. Overbaugh, Herbein and Butler, also with their kindly aid, put the finishing touches on to make the tournament the success that it was. It was pleasing to note that all the representatives present were pleased, as each one's goods were being used, and in the high scores each got a "taste."

Lunch was served on the grounds in the old-fashioned country style, and all the shooters took advantage of its "goodness" and ate heartily. The following scores show how easy it is to "blow holes in the air":

Events:	1	2	3	4	5	6	7	8	9	10	Total.
Targets:	10	15	20	25	15	20	15	20	15	25

E. F. MARKLEY, Sec'y.

#### Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., April 23.—At the shoot held on these grounds to-day, in which teams from Schenectady, Ossining and Poughkeepsie gun clubs competed, Schenectady made a clean sweep. In their match with the Poughkeepsie team they won by 35 points. In the match with Ossining they won by 47 points. The scores made in each event were hardly up to the standard of many of the shooters, a strong wind being accountable therefor.

The prize, a pair of cuff buttons, offered by the Poughkeepsie Club for best individual score in the Schenectady-Ossining match, was won by Senator Warnick. Scores follow, 50 targets per man in each contest:

Schenectady—Warnick 43, H. E. Greene 39, Valentine 42, Sanders 40, G. G. Greene 31, Livingston 43; total 241.

Poughkeepsie—Tall 41, Marshall 28, Hans 33, Smith 31, Traver 41, Du Bois 32; total 206.

Schenectady—Warnick 43, H. E. Greene 39, Valentine 42, Sanders 40, G. G. Greene 37, Livingston 40, Borden 36, Adams 39, Wallberg 39, Miller 32; total 387.

Ossining—Brandreth 31, Hubbell 32, Clark 36, Von der Bosch 37, Dykman 32, Hyland 39, Harris 38, Blandford 38, Washburne 40, Kromer 17; total 340.

Scores made in events 3 and 4 counted in team matches.

SNANIWEH.

#### Norwich Shooting Club.

NORWICH, Conn.—The weekly shoot of the Norwich Shooting Club was held on Saturday afternoon, April 23, the weather conditions being favorable. The attendance was small and scores below the average. Mr. Aborn was high with a score of 40 out of 50, which was very commendable, this being his second season at the trap. No. 3 was at 5 pairs:

Events:	1	2	3	Events:	1	2	3
Targets:	25	25	5	Targets:	25	25	5
Brown	20	19	5	Saunders	12	11	11
Aborn	18	22	11	Potter	11	11	11
Olcott	21	16	11	Mitchell	15	18	11
Amberg	15	16	2	Noble	21	18	5
Taft	21	18	6				

I. P. TAFT, Sec'y.

#### Brunswick Gun Club.

BRUNSWICK, Me., April 22.—The Brunswick Gun Club held their first shoot of the season yesterday afternoon with a programme of 125 targets.

The attendance of shooters was very light, as the weather conditions were unfavorable in the extreme. Quite a large number of spectators were on hand, as usual.

Four visitors from Portland enabled us to put up two five-men squads. The Portland shooters were Darton, Hinds, Bailey and Foster. L. C. Whitmore, president of the Brunswick Gun Club, was high gun for the afternoon, breaking 108 out of a possible 125, Darton second with 104, and Dunning third with 103. The scores were:

Events:	1	2	3	4	5	6	Total.
Targets:	20	20	20	20	25	15	
L. C. Whitmore	16	20	16	19	16	21	108
Darton	15	16	15	18	19	21	104
Dunning	16	14	19	17	18	19	103
Hinds	16	16	16	20	16	18	102
Foster	14	16	17	12	17	19	95
Wheeler	15	17	15	12	19	13	93
Webber	10	13	12	16	16	17	84
Fisher	6	15	13	17	15	18	84
Nason	8	13	11	11	9	11	52
Bailey	7	12	8	11	11	11	27
Libby	11	11	11	11	11	11	14
Graves	11	11	11	11	11	11	11

#### Ashland Gun Club.

LEXINGTON, Ky., April 14.—The Ashland Gun Club to-day gave a shoot in honor of Mr. Hood Waters, a distinguished trade representative, who is at present sojourning in Kentucky. He broke 91 straight and finished with 98 out of 100. In the afternoon he shot at 150 targets, which included 10 pairs, and he scored 145. Mr. Woolfolk Henderson scored 73 out of 75. Bob Skinner scored 49 out of his first 50 and lost 3 birds in his last string of 25, a total of 71 out of 75.

Victor Dodge, the veteran shooter, faced the traps for the first time in many months, and scoring 70 out of 75, showed that he has not forgotten how to shoot.

Frank Van Deren broke 42 out of his first 50, but fell down badly on his last 50, losing 17 birds, making his total score read 75 out of 100.

Other shooters shooting very well indeed were Messrs. Woolfolk Barrow and his guest, Mr. A. Mumford; Mr. Clifford Clark and W. B. Tolbert. Altogether the sport yesterday was high class and demonstrated the fact that Lexington has some splendid target shots.

Mr. Waters was in the city, the guest of Mr. Robert Skinner, and April 15 he left for Paris, where a shoot will be held for him to meet the Paris Gun Club.

## IN NEW JERSEY.

### Trap at Montclair.

Montclair, N. J., April 23.—The Montclair Gun Club held no shoot on its own grounds to-day, but paid a visit to the Montclair Golf Club and held a joint shoot on the grounds of the latter.

Event No. 1 was a match between the two clubs, teams of seven men each, 50 targets per man, losers to pay for the birds. The Gun Club was the winner. Scores: 244 to 224.

Event No. 2, 15 targets, prize a silver mug, went to Mr. T. E. Batten, of the Gun Club; score of 15 straight.

Event No. 3, 15 targets—5 doubles and 5 singles—prize a cartridge case, was won by Mr. Gunther, of the Gun Club, with a score of 13.

Event No. 4, 15 targets, prize a silver match safe, was tied twice by Messrs. Fitch and Kendall, but finally was won by Mr. Kendall, also of the Gun Club, by a score of 13 to 11.

Considering the exposed location of the grounds on the top of the Orange Mountain, and the stiff easterly gale blowing directly into the faces of the marksmen, remarkably good scores were made. The Gun Club felt fully repaid for their visit, they leaving nothing behind but some empty cartridges. Scores appended herewith:

Event No. 1, 50 targets each; teams of seven men:

Montclair Golf Club—Fitch 35, Holzderber 28, Allan 30, Green 23, Hyatt 34, Geo. Batten 36, Cross 31; total 222.

Montclair Gun Club—Soverel 30, Gunther 31, Crane 36, Kendall 31, T. E. Batten 36, Babcock 32, Wheeler 38; total 244.

Events:	2	3	4	Events:	2	3	4
Targets:	15	15	15	Targets:	15	15	15
Cocktail	10	7	3	Fitch	10	11	13
Matthews	11	8	8	Allan	7	10	10
Kendall	12	11	13	Geo. Batten	11	7	7
Crane	11	7	9	T. E. Batten	15	11	11
Howard	9	10	10	Holzderber	9	8	11

Green	11	11	12	Winslow	8	5	5
Cross	14	10	10	Babcock	5	10	10
Wheeler	13	11	11				

E. WINSLOW, Sec'y M. G. C.

### North River Gun Club.

Edgewater, N. J., April 16.—The scores made to-day and on April 9 are appended. On the latter date, event No. 6, handicap trophy shoot, was won by Mr. Fred Truax, this making the fourth win for him. He is declared the winner of the trophy. Handicaps apply to that event only. Scores:

Targets:	15	10	15	15	15	25	25	10	10
Eickhoff, 3	8	4	9	11	9	12	16	9	11

## WESTERN TRAP.

### Indianapolis Gun Club.

INDIANAPOLIS, Ind., April 18.—Saturday, the regular club day, found a small attendance, as the boys have not quite recovered from the tournament held last week. For the Hunter Arms Co. trophy, with the allowance on handicaps, Sayles, Michaelis, Medico, Moller and Nash made 50 straight. In the Michaelis, Partington contest for the English Hotel cup, Partington was badly off, losing 10 out of one string of 25, and finished with 77 to 85. Mr. Gus Moeller will next try conclusions with Mr. Michaelis, the contest for the cup to take place April 30.

The following practice scores were made: Michaelis shot at 150, broke 128; Head 100, 89; Moeller 125, 84; Medico 100, 70; Sayles 125, 100; Nash 100, 74; Williams 75, 52; Partington 100, 78; Benjamin 75, 56.

### Garrett beat Hirschey.

H. C. Hirschey arrived in Colorado Springs, Colo., April 19. He had a box of shells with him. As is the custom, John Garrett set out a case, and with a few of the locals repaired to the shooting park, and then the fun started.

Garrett shot at 200, broke 187; Hirschey 200, 183; Hervey 150, 86; Sanderson 150, 110; Rich 75, 51; Reasoner 125, 64; Genter 125, 76; Meredith 50, 38; and Weimer 25, 24.

### At Des Moines, Ia.

The season is now fairly on at Des Moines, Ia., and much interest is being taken in the fine gun offered by Hopkins Bros. The contest held April 19 shows the old-time interest. Shooting at 100 targets in two strings of 50 each, the scores stand: F. Sanders 92, W. E. Kessler 85, Oscar Close 82, H. Patterson 80, H. Nuples 78. French, Holgerson and Budd Hunter are thought to be able to show up among the high ones before the shoots grow much older. The race is young yet.

On April 19 the Lakefield, Minn., Gun Club, known as the duck shooters' club, held a shoot Monday, which resulted in a tie and shoot-off that was a hot one. Shooting at 25 targets, Winters made 22 straight, and then lost the last 3, Post 23, Bisping 23, Morrison 23, Winters 22, Keer 20, Rue 20, Root 19. In the shoot-off Post won with 10 to Morrison and Bisping 9 each. The club here wish to call the attention of all the clubs to the fact that the Peters trophy is still held by it, and a challenge would be accepted promptly.

### At Battle Creek.

Battle Creek, Mich., April 18.—The opening shoot at the Sanitarium City was a great success, as it would not be thought possible that fifty-three shooters would turn out to practice and witness the shooting of Mrs. Nellie Bennett, who was in the city on a touring trip. Mrs. Bennett made some good scores, although the wind was strong, she made 9 out of 10 and 21 out of 25. Class A had only four entries. Shooting at 25 targets, O. R. Hensler and McMakin tied on 19, Forsythe and Howes getting 18 each. On the shoot-off McMakin won the prize, a silver cigar and ash receiver. Class B was hotly contested. Mr. Gilkerson won the gun cleaner after a shoot-off with Francisco on a score of 14 out of 15, Mr. Ricketson taking the second prize.

Class C had the largest entry, there being five squads and three prizes. Mr. Snyder won first with 10 out of 15; Mr. Wiseman with 9 won second; Mr. Abbott with 8 took third. The scores: Robb shot at 35, broke 30; Ricketson 24, 21; Gilkerson 50, 41; Bush 70, 56; Forsythe 60, 48; Carpenter 10, 8; McMakin 35, 28; A. R. Hensler 35, 28; Howes 85, 68; Keef 70, 56; Hylar 25, 19; Wooden 25, 19; Ver West 70, 50; Francisco 50, 35; Essig 50, 33; Mrs. Bennett 110, 71; Gale 20, 13; Smiley 25, 16; Snyder 25, 16; Modan 25, 15; Barnard 50, 30; Wiseman 25, 15; Wetsen 10, 6; Green 10, 6; Hames 35, 20; Breigel 25, 14; Washburn 25, 14; Karcher 25, 14; Beek 25, 14; Davidson 25, 13; Bock 10, 5; Abbott 25, 12; Kelsey 25, 11; Willard 25, 10; Grodin 25, 10; Post 25, 10; McKenzie 25, 9; Phillips 25, 9; Murehead 25, 9; Robertson 25, 9; Bartholomew 25, 7; Shine 25, 4; Evans 10, 1; Southern 25, 2; Barcroft 25, 2; Bryant 20, 5.

### Congress of Illinois Shooters Tournament.

Litchfield, Ill., April 21.—For some months the combined efforts of the trapshooters of southwestern Illinois has been lent to the building up of a shooting park at Litchfield that would be attractive and worthy of the name of the best place in Illinois. Among other things provided was a stove, and though hardly intended for use, it was the best thing on the ground during the snow-storm which fell the second day.

Those who left their overcoats and mackintoshes at home were surely hugging the stove when not trying to shoot.

The handicapping seemed to work well, and will be continued at the future five tournaments to be held monthly. The professionals were Messrs. Standish, Vietmeyer, Adams, Boa, Bronough. The missionaries did good work assisting the management.

Cadwallader has broken into the game, and is now shooting and traveling in the interests of the Peters Cartridge Co. All his old friends were pleased to meet him. Tuesday, after the regular events, Connors, the Pekin enthusiast, proposed a 100-target race, and there were four entries, and the proposer came out fourth best. H. Spencer made 96, Scott 95, Mermod 92, and Connor 88.

The third day a somewhat similar race was shot, and though scores were much less, Scott won with 85. The scores:

#### First Day.

#### Notes.

At the Columbus, Neb., State tournament, the State Association will add \$300 cash, two prizes and one trophy; each of the thirty-three events will have \$6 added thereto. The 100-target event will be for \$100 shotgun. Write Gus Schroder, Columbus, for programmes.

E. L. Wetzig, secretary of the Kansas Association, writes that the live-bird race on May 6 will have the Rose system of dividing the money.

The Ashland Gun Club, of St. Louis, Mo., will open up for the season on May 1, and a fine summer's shooting will be the result.

On May 11 there will be a tournament at Decatur, Ill. There will be six 10-target events, four 15 and four 20 target events. After the programme there will be a 50-target event, open to all, with a handicap. Ninety per cent. men shoot at one extra target for every three misses. The 80 per cent. men one target for each two misses. Nine or more men, money divided 50, 30 and 20. The shoot will be run by the old established promoters, Rupert and Kiester.

At Abilene, Tex., the scores of the April 18 shoot were: Stitch 13, Winnifred 18, Middleton 12, Jackson 18, Douglas 18, Briggs 19. In the 25-target race Winnifred made 22, Craig 23, Holt 21, Lughts 16, Douglas 19, Stitch 16, Middleton 10, Jackson 9, Briggs 16.

The Lakefield, Minn., Duck Gun Club held their shoot April 18, at 25 targets. Winners made 22 straight, lost last 3. Then Rost made 23, Morrison 23, Winter 22, Keer 20, Rue 20, J. Rost 19. Rost won with 10 straight in the shoot-off.

### Belle Fourche Gun Club.

Belle Fourche, S. D., April 18.—The Northwestern Stock Growers' Association held their convention here on the 15th and 16th, and the gun club took advantage of that circumstance by holding a two days' tournament.

The weather proved the drawback, and kept many away; otherwise the shoot was a success from start to finish. The first day the snow covered the ground two inches deep, the sky was cloudy and the north wind was strong, making conditions anything but pleasant.

Shooters came principally from Hill City and Hot Springs. Capt. A. H. Hardy, of Hyannis, Neb., was present.

The second day the wind was blowing a gale, and the shooting was more handicapped than on the first. The scores, as shown by figures herewith, look low, but in reality were good. The east wind was so strong as to blow the shooters from the score at times.

The high averages are shown in regular order.

The visitors were much pleased at the way they were entertained by the members of the home club, and all will show up at Hot Springs when the Interstate shoot is on. The scores:

#### First Day.

### St. Louis Tournament.

St. Louis, Mo., April 18.—Sunday, the opening tournament was held at the Central Gun Club grounds, with Lenharth as manager. The weather was fine, and ten shot the whole programme through. Those present included Miss King, of St. Louis; Mr. Vietmeyer, of Chicago; Mr. Chas. Spear, the well-known powder man; Hugh Snell, of Litchfield, Ia; Fred Scheiss and Wm. Cottrell, of Alton; Thos. Roff, Eugene Delitine, Steve Lopage, of French Village, Ia. Wm. Clay was high man, losing but 9 out of 150; Mr. Scheiss second, Mr. Baggerman and Vietmeyer were third and fourth. The scores:

## Haverhill Gun Club.

HAVERHILL, Mass., April 19.—Our Patriots' Day tournament proved a great success; in fact, far beyond all expectation; forty-eight enthusiasts being present. While the sport was not rushed, 5,150 targets were broken. The background being none of the best, and quite a strong wind, the shooting was anything but easy; but a glance at the summary will show some very fine scores.

Horace Kirkwood landed high average for the entire programme, and as a consequence, wears a new stick pin. E. J. George was second.

In the five-man team match there were seven entries. Birch Brook, of Lynn, was an easy winner, and are carrying their matches in silver boxes, while the Boston G. C. were awarded Lefever gun cleaners, in hopes that they would swab out their fuses, and do better next time.

Among our many visitors were Mr. Gus Greiff, of New York, who remained this time until the curtain rung down. Mr. E. B. Thompson, who did not shoot, but was willing to tell us all about his company's guns, shells, etc.; Messrs. Powell and Alexander, of Newport, R. I.; Hallam and Corson, of Dover, N. H. Boston, Lynn and Lawrence were represented by whole crowds.

One of the pleasing features was the number of new-comers in the game, several having never before gunned for the birds, but are now prospective record-breakers. Events 1, 4, 7, 9, regular; 2, 5, 8, 12, unknown; 3, 6, 10, reverse; 11, straightaway. The summary follows:

Five-man team match, 50 targets per man, 15 regular, 15 unknown, 10 reversed, 10 straightaway:

Birch Brook, Lynn.	Taylor	30
Frank	Eastwood	18
Everett	Daley	25-139
Straw	Independent No. 2.	25
Bell	Lawler	34
Kirkwood	Bryant	33
Powwow, Amesbury	Corson	37

## Springfield Shooting Club Tournament.

SPRINGFIELD, Mass.—One of the largest gatherings of trapshooters ever held in this city attended the spring tournament of the Springfield Shooting Club on Patriots' Day, April 19. Many old-timers were present, and many new ones. The club felt quite proud of the success of the meet.

Shooters were present from Rochester, N. Y.; New York city; Providence, R. I.; New London, Conn.; Boston; Greenfield, Mass.; Pittsfield, Mass., and many surrounding towns.

Shooting started in at 9:30. Darkness called a halt after the tenth event, leaving two events still unshot. The National Sportsmen's contest took a lot of time to run off, having forty-nine shooters to compete out of ninety-three entered. This event, being handicapped, was very interesting to watch.

The day was perfect in the morning, but at noon it clouded up and a snow squall set in, which made it very uncomfortable for the shooters, who seemed glad to hug the stove in the club house whenever an opportunity presented itself.

The trade was represented by Neaf Apgar, T. H. Keller, Jr., E. D. Fulford and T. E. Doremus.

E. C. Griffith easily captured special high gun prize of a \$5 gold piece, shooting an average of 90 per cent.

The National Sportsmen's contest was a handicap event, from 15 to 25 yds. Hawes (17 yds.), of the local club, and Knowlton (20 yds.), of New York City tied on 19 each for first and second prizes. In the shoot-off Hawes won first and Knowlton second. There were four ties of 18 each for third and fourth prizes. Dr. Keith (20 yds.), White (20 yds.), Clark (22 yds.), and Coats (18 yds.). In the shoot-off Dr. Keith won third and Coats fourth prize. These prizes were donated by the publishers of National Sportsman, and were as follows: First, a Winchester Brush gun; second, Winchester repeating rifle; third, Stevens hammerless ejector gun; fourth, Waterman fountain pen.

Three of the four prizes were won by club members. Scores in this special merchandise distance handicap event, 25 targets, follow: Keyes (16) 7, E. L. Cady (16) 11, Kimball (16) 9; Fisher (16) 2, Mott (16) 6, Rice (16) 6, Bradford (16) 8, Dr. Hubbel (16) 14, A. Snow (16) 10, Parsons (16) 15, Peck (17) 14, Hawes (17) 19,

Gesner (18), 11, Graeff (18) 18, Coats (18) 14, W. H. Snow (18) 11, Hartwell (18) 8, Bridgeman (18) 6, Dickinson (18) 3, Swan (18) 6, Walker (18) 6, Story (18) 10, Oscar Cady (19) 12, Kites (20) 14, Dr. Keith (20) 18, Dr. Newton (20) 16, Sidway (20) 13, White (20) 18, Cooley (20) 15, Knowlton (20) 19, Hackett (20) 7, Ochford (20) 16, Douglass (20) 17, Prest (20) 14, Root (20) 13, Mectalf (20) 12, McMullen (20) 13, Le Noir (21) 15, Dr. Moore (21) 16, Barstow (21) 14, Shaw (21) 12, Smith (22) 14, Manchester (22) 14, Chapin (22) 15, Greenwood (22) 17, Adkin (22) 12, Clark (22) 18, Dennison (22) 8, Griffith (25) 15.

The best shooting of those shooting all day was done by the following:

Shot	at.	Broke.	Cent.	Shot	at.	Broke.	Cent.
Griffith	175	159	90	Glover	135	112	82
Apgar	175	154	88	Adkin	175	141	80
Barstow	175	151	86	Keller	150	110	73
Fulford	175	146	83	Doremus	150	104	69
Clark	175	144	82

### Midwinter Tournament.

KANSAS CITY, Mo., April 20.—The Western trapshooters met at the new Schmelzer Athletic and Shooting Park, lately fitted up by the Schmelzer Arms Co., of Kansas City, Mo., on Monday morning, April 19, to engage in the fourth Interstate midwinter tournament.

A perusal of the programme was sufficient to show that the tournament would be held on a grand scale, but the new grounds were a surprise to all. Everything new, seven acres of level ground, surrounded by a single snow-white fence, fine spacious club room with lunch room attachments, all complete. The trap pits were sodded and the targets from the Dickey auto-traps came forth as from mother earth. Every one was delighted with the shooting facilities afforded; and from this on, with twin shooting parks, Kansas City will be in the first rank of this great country of ours. Having held the G. A. H. here twice, and having a record-breaking crowd each time, there is an undercurrent now being felt for offering inducements for the 1905 shoot, to be assigned to the great shooting center of the West, where the shooters live.

The name Interstate, as used by this Association, is a little bit confounding with that of Mr. Shaner's Interstate Association, but it should not be so, as it means that the shooters of the Missouri Valley, or properly, including Missouri, Iowa, Nebraska and Kansas, combines the Interstate, and the term midwinter, used designates the shoot properly.

That the shoots have been popular and have drawn well, it will only be necessary to look up back numbers of the FOREST AND STREAM and read the reports. The first shoot, at St. Joseph during the last week of 1903, was a revelation for a winter shoot, and much interest was taken, especially in the five-man team target race and the five-man team live-bird race. Then the individual live-bird trophy has since brought out the most wonderful records ever known to the world.

The second shoot at Omaha was a grand one in point of attendance and interest, and the team and the individual race grew more interesting, and some wonderful scores were made. The shoot was held in Iowa, and will be the last shoot that will be held by the Omaha club wherein live birds are used, for it does not seem to be generally known that both Iowa and Nebraska State laws now prevent pigeon shooting. It is thought that Parmelee scented this afar off, and that is why he moved to Texas, where he could at least cast a hook and take in the very festive tarpon.

The third shoot was held in March, at Seneca, Kans., and though not so largely attended, the quality of the live birds furnished there kept the boys guessing, and they were somewhat outwitted by the Kansas corn-fed birds.

Now we come to the fourth and the last one of the season, though a fifth one had been scheduled for Arnold's Park, Iowa. Yet the stopping of live-bird shooting made it necessary to award all trophies at the close of this, the fourth, shoot.

The opening day found a large gathering of the profession, the expert amateur and the amateur, as well as the big-gunner, who is willing to dip in and try the game, present when the opening hour came.

Everything looked so new and clean that there was a haste to don the sweaters and to get their names registered by Fred Whitney, so as to have a try at "them" are Dickeys." While the traps worked finely and threw a moderate flight, the angles were correctly adjusted, and all things, save the shooters themselves, were in "fine fettle." There was a disposition to visit and get acquainted, and only Chauncey Powers was at his best. He easily led with honors easy with a grand total of 192 out of the 200. Crosby was going steady, and ground out 189, while Ed O'Brien and Wm. Heer, the well-known Kansas boys, tied on 188. Gilbert, after a long rest, had a few bad half hours, and dropped 15, and gave an exhibition when he dropped four in one 15-target event. The scores:

#### April 18, First Day.

#### April 19, Second Day.

The weather was fine, and the scores made show an improvement over the first day. Everybody was in for a good time, and they had it. Interest was centered in W. H. Heer, and he won the high honors. He dropped one in the first event, then ran the next four straight, and then he got "balled up" and dropped four out of the sixth event, this being the half-way mark. He tightened his belt and went the line for 100 straight and a great total of 195. He was, shooting in a squad where there were delays and little annoyances; that do not occur when a squad of old-timers or experts shoot together.

Gilbert had his rabbit's feet crossed to the extent that after he went the first 100 with a 99 clip his trigger-pull got wrong, and he dropped six out of the last 100, and 193 was his wind-up—"very fine."

Billy Crosby lost but 9 for the day. Russell Kline, shooting a new gun, came well on for fourth place with 189. Tom Marshall, showing a decided improvement over first day, landed 188, with Chauncey Powers just one to the rear, having missed the unlucky number.

The squad that attracted the most attention was composed of O'Brien, Riehl, Cunningham, Gottlieb and Marshall. In one event they came within three of a straight score. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	Broke.
Targets:	15	15	20	15	15	20	15	15	20	15	15	20	193

Hayes	167	151	78	396
Timberlake	176	158	74	408

Interstate target team race, five men to a team, 50 targets to the man; a silver cup to the highest individual score:

Experts, targets only—Gilbert 45, Crosby 44, Powers 42, Riehl 43, Heer 42; total 216.

Kansas—O'Brien 46, Wetzig 43, Anderson 36, Johnson 37, Timberlake 41; total 203.

St. Joseph—Arnhold 39, Libby 38, Hardy 41, Eisenhaur 38, Cunningham 45; total 201.

Kansas City—Clayton 26, Holmes 41, McGee 46, Gottlieb 41, C. Dixon 46; total 200.

Nebraska—Veach 36, Townsend 44, Schroder 37, Reed 37, Thorpe 45; total 199.

Iowa—Burmister 23, Ford 29, Kline 44, John B. 25, O. N. F. 30; total 131.

Ed O'Brien, of Florence, Kans.; W. McGee, of Kansas City, and C. Dixon, of Onarga, Mo., tied on 46. Shoot-off, Dixon won; score, Dixon 22, O'Brien 21, McGee 20.

The Schmelzer amateur individual championship target trophy, 50 Dickey birds, open to amateurs: Kline 48, McGee 46, Veach 46, Timberlake 43, Arnhold 43, H. Dixon 41, Libby 41, O'Brien 40, Reust 40, Dr. Hardy 40, Wetzig 40, C. Dixon 39, C. Pierce 38, Townsend 37, Hays 35, Eisenhaur 33, Schroeder 35, Dr. Plank 41.

Kline wins first and the cup; others in the money as per scores, as there was an optional sweep of \$2 on the side.

This cup will be contested for monthly at the Schmelzer Athletic and Shooting Park. All who have won it will contest for final possession.

Winners of special cups offered by Schmelzer: Sunday, Dr. Plank, of Kansas City; Monday, Dr. Hardy, of Mo.; Tuesday, Wm. Veach, Falls, Neb.; Wednesday, H. Pierce, Chicopee, Kans.; also Russell Kline won extra for a wind-up.

These were put up by Schmelzer Arms Co. at the close of each day, and proved to be interesting events, and further evinced the liberality of Schmelzers, the promoters of the tournament.

#### Those Present.

Shooters were present as follows:

Iowa—John Burmister, Fred Gilbert and Russell Kline, Spirit Lake; O. N. Ford, Central City.

Illinois—W. R. Crosby, O'Fallon; C. M. Powers, Decatur; Tom Marshall, Keithsburg; W. L. Hayes, Dwight; Frank Riehl, Alton. Nebraska—Wm. Veach, Falls City; Wm. Townsend, Omaha; Reed, Iowa.

South Dakota—H. G. Taylor and E. Spatz, Meckling. Kansas—E. L. Wetzig, Junction City; Ed O'Brien, Florence; Wm. Heer, Concordia; B. Johnson, Le Loup; Henry Anderson, Salina; D. Timberlake, Baileyville; Frank Hodges, Olathe; E. Decker, Pleasanton; Geo. R. Mackie, Scammon; Walter Peterson and O. F. Brae, Pleasanton; H. and G. Pierce, Chicopee; Chas. Kleinhaus, Grantville.

Missouri—F. B. Cunningham, St. Joseph; C. Gottlieb, John Cornett, Wm. Campbell, Joe Batchellor, Jr., Wm. Clayton, A. C. Holmes, Alva Wilson, Dr. Plank, Forest Wickey, Walter Howe. Tom Norton and Harry Sherman, of Kansas City; Dr. Hardy and B. Eisenhaur, Hale; C. Dixon, Joplin; H. Dixon, Oronargo; J. M. Marshall, Dr. R. L. Hamilton, W. A. Smith, and Dr. R. Sevier, Richmond; F. E. Rogers, Bucklin; Joe Batchellor, Sr., St. Joseph; C. Willis and E. Willis, Bean Lake; S. L. Beasley, Pleasant Hill; R. Dougherty, Bean Lake; John Wilmot, Lexington; Geo. Essig, Plattsburg; Joseph Leggett, Carthage; J. S. Thomas, Pleasant Hill.

O. Cundy, Atlanta, Ga.; A. E. McKenzie, Denver, Colo.; C. F. Reust, McLeod, O. T., and C. F. Legg, Chewelah, Wash.

#### Business Meeting.

On Tuesday evening the officers invited all the shooters to a business meeting in the hotel parlor, Chris. Gottlieb in the chair.

The first business was to decide as to the trophies for the team contests, taking into consideration that the live-bird shooting has been prohibited in Iowa. It was carried that the three best scores should decide the team trophies. A proposition had been received as to taking Denver into the Association. Mr. McKenzie was called upon, and he stated that it had occurred to them and to those in the Missouri Valley that the distance was too great and would not be feasible.

Officers for next year were selected as follows: Chris. Gottlieb, President; Ed. O'Brien, Vice-President; Frank Cunningham, Secretary; W. D. Townsend, Treasurer; John Burmister was added to the list of officers to constitute a board for running the tournament. Three more names were to be selected by the president and added to the tournament committee. It was voted to have five shoots during the winter of 1904 and 1905, and that four best team scores should count on general average.

Mr. Gottlieb called Tom Marshall to the chair and offered the following resolutions, which were unanimously adopted:

#### Resolution of Respect.

Whereas, we have learned with profound sorrow of the death of M. J. Elliott, the mother of friends and comrades J. A. R. Elliott, Robert S. Elliott and Dave Elliott; be it

Resolved, by the trapshooters in attendance at the tournament in progress at Kansas City that we extend to our brothers and all members of the family our sincere sympathy in this hour of their great sorrow.

Resolved, That a copy of these resolutions be forwarded by our secretary to the members of the family, spread upon the records, and also furnished the several sporting papers. Signed Chas. J. Schmelzer, Chris. Gottlieb, Tom Marshall, W. Fred Quimby, Fred Gilbert, Tom Norton.

F. B. Cunningham, Sec'y.

#### April 21, Fourth Day.

The day was not of the best, yet it was a good day to make live birds fly, as the strong wind was an assistant that is not always appreciated by the shooters. During the forenoon, the clouds hung heavily, and through the afternoon the sun shone for a couple of hours. The shoot was continued until late into the evening, when dark clouds again made the light bad.

There were thirty-five entries for the individual championship; open to all, with handicap; 25 live birds, \$20 entrance, the winner to hold, subject to challenge, the Wyeth trophy that Fred Gilbert won at St. Joseph at the first midwinter tournament and has successfully defended until it was called in and put in open competition here.

Owing to a late start in the morning, the shoot was not ended, yet enough shooters finished to show that the only straight score, which was made by John Wilmot, of Lexington, Ky., could not be tied.

Mr. Wilmot proved a fine shot, though publicly heretofore was rather an unknown shooter. He showed up well with the first barrel, and shot so quick that the most of his birds seemed fairly easy. He used the second shot but eight times. He had luck with him on one occasion, as a bird struck the wire.

Those who had hard luck to lose a dead out or skip one were Russell Kline, Tom Marshall, Ed O'Brien and Gorman. The 23s had many for its division, yet as the Rose system was used, each received \$24.45.

Where the topnotchers landed shows you the class of birds furnished. They came from Chicago and were handled by R. C. Cox. Most of the retrieving was done by dogs, and they did well, especially the dog owned by Arthur Gambell. They were handicapped by the fresh cinders, which cut their feet. The scores:

Crosby, 33	1222122011221122222000222-21
Wickey, 27	2022111210202222202020*22-17

#### April 22, Fifth Day.

The morning opened up bright, with a quartering strong southwest wind, which blew through the day, making left-quartering incomers hard to get down before passing the boundary. The handicap was finished, and then the Interstate five-man team race was shot, which kept the traps busy until after 4 P. M.

There were five teams entered, two from Missouri, and one each from Kansas, Nebraska and Iowa. The shooting was better

than on the previous day, as the scores improved. Cunningham and Zim, of the St. Joseph team, each made 25. Kline for Iowa, and O'Brien for Kansas, duplicated. Anderson and Gorman, of Kansas made 24. In their class came the Schroeders, of Nebraska.

The team race was very hotly contested, and was not decided until the last shot. Kansas landed the winner by killing 118 out of 125—landed not only the winner for this meeting, but landed besides the high average for the series of midwinter shoots, beating out St. Joseph by two birds. It was unfortunate for the St. Joseph boys that the committee had so changed the programme as to count only the three highest scores, as, providing the four highest had been counted, then St. Joseph would have won by six birds. For this shoot, Iowa and St. Joseph tied on 116, but this was due to the good shooting of Kline and Ford, who shot two strings—Kline dropped but one, and Ford four out of the 50.

The Kansas City team fell so far behind that it lost the general high average. Kansas City did not have their regular team entered, as three of them were new men. The scores:

St. Joseph Team.	
Cunningham	2111111222212222122222-25

#### PUBLISHERS' DEPARTMENT

The Hearthstone Inn, near Livingston Manor, P. O. address De Bruce, Sullivan county, N. Y., offers to anglers good fishing and comfortable quarters within a reasonable distance from New York. Excellent bass and trout fishing are had there, together with many other attractions. Mr. Wm. F. Royce, the proprietor, has an attractive booklet which he is very glad to send to applicants.

Catches of trout at the Spruce Cabin Inn., Canadensis, Pa., have been very good this spring, notwithstanding the extraordinary lateness of the season. The streams are all in good condition, and the trout running large, so that the prospects from now on are good. About forty visitors have registered there already this season.

#### New Advertisements.

The hunting and fishing along the Detroit & Mackinac Railroad—the Turtle Route—makes it one of the most attractive in the world for people living in big cities who wish to make an inexpensive outing, with some active interest. Of course, the shooting does not come until fall, but the fishing will be on now just as soon as the snow gets out of the woods. The general passenger agent of the Detroit & Mackinac Railroad at Bay City, Mich., will send, on application, a copy of the little booklet describing the resources of the country.

Beginning not so very many years ago, tarpon fishing has taken higher and higher rank in the estimation of anglers, until now many of them regard it as calling for more skill than any other form of the sport. The most accessible tarpon waters are those of Florida, and these are described in the booklet on "Sarasota Bay," which is sent on application by Mr. C. B. Ryan, G. P. A. of the Seaboard Line, Portsmouth, Va.

Great as is the black bass, all attempts at his artificial propagation have failed, until within the last year or two. At last, however, the problem has been solved, and Mr. Henry W. Peckman, of New Preston, Conn., having demonstrated that the small-mouthed black bass can be artificially reared, is prepared to furnish fry of different sizes up to fingerlings to those persons who desire to stock their ponds.

While neither the angler nor the gunner is likely to suffer from coughs and colds while he is afield, nevertheless these maladies do sometimes overtake him, and for his own comfort he must cure them as quickly as possible. The cordial known as Schnabel's Rye Whiskey and Rock Candy is said to be strictly a medicinal preparation, and very effective against such troubles. What it will do is told in a pamphlet, to be had of Frederick West's Nephews, 89 Water street, New York.

Lake St. John, we take it, is still snow-bound, and its trout and ovananice are still under the ice; but this is about to break up, and a few warm days will turn the thoughts of the Northern angler to this well-known resort. It is reached by the Quebec & Lake St. John Railroad, and all information about it may be had by applying to Mr. Alex. Hardy, G. P. A., Quebec, Canada.

## BAKER SPECIAL PARAGONS.

Strictly high grade. Built to order at regular prices. \$60, \$75, \$200 and up. Carefully fitted and highly finished. Baker guns have a long established record for hard shooting and great durability.

Send for FREE QUARTERLY and 1904 booklet fully describing all grades.

BAKER GUN AND FORGING CO.,

Cor. Liberty & School Sts., BATAVIA, N. Y.

## MY TRAP SCORES

A pocket trap score book, containing 50 pages of score sheets and the Interstate Association Rules for target and live bird shooting, and for shooting under the Sergeant System. The cover bears the title "My Trap Scores," and the pages, in number and form, are arranged to make a complete record of the shooter's doings at the traps. The pages are ruled to make a record of the place, date, weather conditions, number of traps, number of shooters, gun and load used, events, etc. The score sheets are ruled for 25 targets. Bound in leather. Price, 50 cents.

FOREST AND STREAM PUB. CO., 346 Broadway, New York.

# FOREST AND STREAM.

## A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, SATURDAY, MAY 7, 1904.

VOL. LXII.—No. 19.  
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

### THE LOUISIANA PURCHASE EXPOSITION.

ON Saturday of last week the Louisiana Purchase Exposition, commonly known as the World's Fair, at St. Louis, was formally opened with dignified, appropriate ceremonies whose every detail was majestic and harmonious, as was befitting the launching of an institution so world-wide in its scope, and so honored by the presence of an innumerable host of people. By proclamation of the Governor of Missouri, that day was a holiday in that State in honor of the great centennial event.

The Exposition, while sentimentally commemorative of an important national enlargement which happened one hundred years ago, is practically devoted to the world's best interests and doings. With all possible comprehensiveness it presents the sum total of human progress up to the present time in the arts, the manufactures, and the varied forms of agriculture obtaining in different climes and countries. The diversified products of the earth, the air and the water most serviceable to mankind from the raw to the finished state are quite fully presented for the study of the sightseers.

The elaborate opening exercises were held near the magnificent Louisiana Purchase monument on the great Plaza of St. Louis, commencing soon after 9 o'clock. President D. R. Francis, the chief executive of the Exposition, presided. Grouped about him were members of the National Committee, several Senators and Congressmen, the officers and directors of the Exposition, the Board of Lady Managers, the representatives and commissioners of foreign governments, the orators of the day, important committees, a choir of several hundred singers, while the plaza was occupied by the immense gathering of the people, the power which made the Exposition possible. The chief orator was Hon. W. H. Taft, Secretary of War, who represented President Roosevelt.

A brief address by President Francis opened the formal exercises, after which, by the director of the works, the key of the Exposition was presented to him, which signified that all was ready. This was followed by speeches, the playing of bands, the booming of cannon, the hymnal outbursts of the grand choir, and the applause of the assembled thousands. All was brought to a climax by the unfurling of flags, which followed the starting of the machinery by President Roosevelt, who, at Washington, in the presence of the members of his cabinet, members of Congress, the diplomatic corps, and distinguished ladies and gentlemen, touched the Morse key which formally opened the Exposition, the time being 12 M. at St. Louis and 1 o'clock at Washington.

Thus was brought to gratifying realization the gigantic centennial scheme which was suggested in an editorial of a St. Louis paper in 1898. It took material form at a convention held in January of the following year at St. Louis, and called by the Governor of Missouri for its consideration. The complete work is thus the development of an original idea presented by a journalist.

The Exposition is in commemoration of the acquisition of the vast territory purchased by the United States in 1803, and known as the Louisiana Purchase. It contained 1,000,000 square miles and cost \$15,000,000. That territory is now occupied by Louisiana, Arkansas, Missouri, Oklahoma, Indian Territory, Kansas, Nebraska, Iowa, the two Dakotas, and by parts of Colorado, Wyoming and Montana. It is the centennial celebration of one of the greatest and most beneficent events of American history.

In cost and space occupied it surpasses all prior world's fairs. The Columbian Exposition at Chicago in 1893 had 613 acres and 150 buildings at a total cost of \$40,000,000. This was the St. Louis World's Fair's greatest rival. The other great expositions, at Paris in 1900, Glasgow and Buffalo in 1901, Charleston in 1902, were very much

smaller. The St. Louis fair has 1,240 acres and 250 buildings, great and small, at a total cost of \$50,000,000. Forty-four States and fifty foreign countries are participants.

FOREST AND STREAM has been an exhibitor at all the important world's fairs from the Centennial at Philadelphia in 1876 up to the present time. At each of them—the Centennial, the Columbian Exposition at Chicago, the Paris Exposition, besides other minor exhibitions—FOREST AND STREAM has been officially recognized to the highest degree which the awards allowed, by medals and diplomas—the last a grand prize and gold medal from the French Exposition at Paris in 1900. These recognitions of its merit by the many eminent men who were judges at the various fairs have been granted on the ground of the paper's high order of literary merit, for its services in matters pertaining to the preservation of game and fish, to the advancement of fishculture, to the sport of yachting, and for its general interest to those who use the gun, the rod or the sailing vessel.

We have an exhibit at the World's Fair in St. Louis, at which, among other things, is shown a complete set of the sixty-one bound volumes of FOREST AND STREAM, which include a complete history of game protection and fishculture in the United States, besides a vast amount of most interesting reading for the sportsman in any field. At this exhibit—in the Forestry, Fish and Game Building—all readers of FOREST AND STREAM and all who are interested in the sports which it covers will be very welcome.

### A NEW GAME BIRD.

TO MANY game dealers and hotel keepers the enactment into law of the FOREST AND STREAM Platform Plank, forbidding the sale of game, seemed a real hardship. When this plank was first announced it was received with derision by those whom it would most certainly affect, but time has shown that it appealed to the public and that it has come to stay. That some people should be hurt by the non-sale law which prevails in many of the States was inevitable, but it was a case where the greatest good to the greatest number had to be considered.

Meantime, the hotel and restaurant keepers have been looking for a way out of their difficulty; and this is the parable of one of them: This man keeps a large summer hotel in an important town in a State where the sale of grouse and woodcock is forbidden. When the bill forbidding the sale of upland game birds went through, he began to think and to think hard. He did not wish to violate the law, but he must either do that or provide for his guests a satisfactory substitute for the grouse he had been accustomed to serve. A substitute was found, and one so satisfactory to his guests that even after the season opened and grouse might lawfully be purchased, there was no demand for them. His guests preferred the bird that he had been serving, and the hotel keeper believes that this bird is destined to take the place of the ruffed grouse in all leading hotels and restaurants.

This game bird is a young turkey, weighing from one to one and one-quarter pounds. They cost the hotel keeper last summer \$1 each and were served at \$2.50. Last year, although 2,500 birds were bought and served, the supply was not equal to the demand. For the coming season the hotel keeper has large contracts at \$1 per bird, and hopes to have an abundant supply.

For this new game bird he claims the advantages of (1) unlimited supply, as they can lawfully be placed in cold storage and kept until needed; (2) they can be served at any season; (3) there are no shot-torn birds; (4) they are in better condition and give better satisfaction to the guests than game birds.

It is understood that the same hotel keeper has contracted with neighboring farmers for 2,500 young guinea hens, which he may possibly use as a substitute for woodcock. He purchases his trout from a hatchery and keeps them in ponds until they are needed. He uses no wild native trout.

Besides the advantage to hotel keeper and guests, the commercial effect of the course here outlined is worthy of consideration. The purchase of these young fowl benefits the farmers by stimulating one of their industries, raises the price of fowl, and is a real help to the neighborhood from which the birds come. Thus, on every hand, it would seem that the substitution of these domesticated fowl for the wild and untamable native birds is an ad-

vantage to the community, and the changed point of view of a man who has been a large consumer of wild game may be commended to the consideration of other persons who are carrying on commercial pursuits similar to his.

From this it may be fairly inferred that where there is a will there is a way, and that hotel and restaurant keeper may obey the law and still suffer no great hardship.

### ADIRONDACK FOREST FIRES.

THE extensive fires which took place in the Adirondack region in the spring of 1903 led to much discussion in the columns of the FOREST AND STREAM as to the causes of these fires. The timber land burned over amounted to more than 600,000 acres, and about \$175,000 was spent in fighting the fires, which were at last extinguished only by heavy rains. The total direct loss has been estimated as between \$3,000,000 and \$4,000,000, while the indirect loss due to the destruction of young trees, which should form future forests, and the injury of the forest soil caused by the burning out of the vegetable matter required by growing trees cannot be estimated.

The Bureau of Forestry has investigated the burned area and a number of matters connected with the fires, and has just issued a circular, illustrated by a map of the Adirondack region, showing the location and area of the various burned districts. The report is made by Mr. H. M. Suter.

The very severe spring drought of the spring of 1903 left the forests ready for the flames. The snow fall of the winter of 1902-03 was light, and between the 17th day of April and the 7th day of June there was a rainfall of only about 0.2 inch. On June 10, 11 and 12, there were heavy rainfalls, and the fires were thus extinguished.

"As a result of this protracted drought the whole forest was inflammable to an unprecedented degree. On cut-over land, the debris left after lumbering was ready to catch fire like tinder, and to spread it almost like a powder magazine. Throughout the Adirondack region, which is one great forest, broken only by lakes, marshes and clearings, every chance spark left unextinguished by smoker or camper, every glowing cinder from locomotive or brush burner's fire, carried the potentiality of a great conflagration. This was at the season when fishermen were building camp-fires and smudges in every direction. Under such conditions many incipient forest fires were and will always be inevitable. The only hope of preventing wide devastation at such times is through systematic watchfulness to extinguish every little blaze before it has time to gather headway."

Some of the worst fires were near Lake Placid, in Keene Valley, in the Nahasane Preserve, near Catlin Lake, near Horse Shoe Pond, on the DeCamp tract, and on the Rockefeller preserve. The fires were fought by the State administration, as well as by individuals, and this fighting was carried on during six weeks.

Besides the money and indirect forest losses, there was undoubtedly a large loss in fish and game. The breeding and nesting season was at its height, and there must have been a great destruction of young birds and animals. Trout suffered—in shallow streams probably from the heat alone; in deeper streams from the lye leaching from the wood ashes into the water.

By far the greater part of the fires were caused by culpable carelessness; many by deliberate incendiarism, and a few by accident. Fully one-half of the fires due to carelessness are charged to locomotive sparks from railroads passing through the Adirondacks, and an examination of the map shows how the burned areas follow the paths of certain railroads. The burning of brush by farmers caused many fires, and much of this brush burning was done contrary to law. It is believed that the strong feeling of hostility to private preserves existing in some portions of the Adirondacks was responsible for a number of incendiary fires, especially those which started on the preserves; and the fact that \$2 a day is paid as wages for fire fighting is thought in some cases to have led to the setting of fires in order to keep the work going.

Of the conclusions drawn from the fires by Mr. Suter, the most important is that should another long drought occur the State would be powerless, under present methods, to prevent a repetition of the calamity of last spring. An improved fire service, based on a careful study on the ground of the whole Adirondack region, can alone combat the terrible fire evil.

### VIII.—Alexander Mackenzie.

#### II.—Across the Continent.

The next day the forests seemed to be on fire, since clouds of thick smoke rose from the wood with a strong odor of burning resin. On the afternoon of June 19 they saw smoke on the shore, but before they could reach land the natives had deserted their camp. Mackenzie sent his Indians after them, but they were threatening and discharged five arrows, which, however, did no harm. They had left some property behind them, which the men desired to take with them. A few things were taken and some useful implements were left in exchange. The next morning they were off early, in a fog, and saw two "red deer" at the edge of the water. Another was seen and might have been killed but for the dog, which frightened it. These, Mackenzie says, are "not so large as the elk of the Peace River, but are the real red deer, which I never saw in the north, though I have been told that they are to be found in great numbers in the plains." Here the natives had stripped the bark from many of the spruce trees, presumably to roof their cabins. A house was seen thirty feet long and twenty wide, evidently to be occupied by more than one family.

The constant accidents to which their canoe had been subjected and the carrying it from place to place had so racked and broken it that it seemed almost hopeless to go further in it. On Friday, the 22d, Mackenzie, recognizing the possibility that on his return he might have nothing to eat, made a cache of ninety pounds of pemmican in a deep hole, over which a fire was built.

The next day, as they went on, they saw a small canoe drawn up to the edge of the woods and soon after another came out from a small river. The man who was in it called to his friends, who at once appeared on the bank, armed with bows, arrows and spears. Although they were evidently much alarmed they were very threatening in their gestures and let fly a volley of arrows, which did no harm. Mackenzie landed on the other side of the river and stopped there, his interpreters trying to pacify the Indians, but without success. Two men went off in a canoe down the river, apparently to procure assistance. Mackenzie, now having taken the precaution to send one of his Indians with a gun into the woods to keep within easy reach of them and to shoot any one who might attack him, walked along the beach and invited the Indians to come over and see him, while his interpreter declared to them that these people were his friends. At length two natives came over in a canoe, but stopped a hundred yards from the shore. Mackenzie signalled to them to come to land, showing them various articles which might be attractive, such as looking glasses, beads and other things. Very slowly they drew nearer to the shore, but at first would not venture to land. At last they came near enough to get some beads, and were persuaded to come ashore and to sit down. It was found that his interpreters could talk with these people, and though Mackenzie tried to persuade them to come to his canoe they did not wish to, and asked his permission to go back to their own side of the river. This he granted, and their return to their friends was evidently a matter of great rejoicing, while the articles that they took back with them were examined with the greatest curiosity. After a little time the white men were asked to come over to their side, which they did. The Indians were still timid, but the distribution of a few trinkets among them and a little sugar to the children seemed to strengthen their confidence.

These people reported that the river ran to the south and that at its mouth white people were said to be building houses. There were rapids and falls and also very terrible people along the shores; people who lived in underground houses, and who might do them great harm. The night was spent here.

Still traveling in his crazy canoe, Mackenzie kept on. Before long he came to a camp, the Indians of which, as usual, threatened, but the new friends made the day before soon set their fears at rest. Among the Indians here was a Rocky Mountain captive, taken by the Crees, who had carried her across the mountains, but she had escaped from them, and in the effort to return to her own people had been captured by the tribe with whom she was now living. As he saw more and more of these natives he found not a few people from the Rocky Mountains with whom his own hunters could perfectly well converse, and under these circumstances he did everything in his power to learn about the course of the river down which he was passing. There was evidently a considerable trade between the coast and the upper country, for iron, brass, copper and beads were had from the west.

Mackenzie now had remaining about thirty days' provisions and not more than 150 balls, with about thirty pounds of shot, which also might be used for balls, though with considerable waste. He was somewhat doubtful what to do, not only on account of the

shortness of his supplies, but because of the great length of time that it would take him to journey to the sea and return. If he went to the coast by this river it would seem impossible to reach Athabaska the same season. He now called a council and asked the advice of his people, saying that he wished to try to reach the ocean over land, because he thought it would be a saving of time, but declared that he would not attempt to do this, but would go by water unless they would agree that if the land journey proved impracticable they would return with him and continue the voyage to the discharge of the waters, whatever the distance might be. The men were most loyal, and all declared that they would follow him wherever he should go. He now set out to go back up the river to that point which should seem nearest to the seashore. Their guide preferred to travel on the shore, and although Mackenzie did not greatly like this, he thought it unwise to oppose him. The next day, as some of the men were walking along the shore with the guide, they met some Indians who threatened them. The guide ran away, and Mackenzie's people kept with him. Finally the guide escaped from them and the people returned to their leader. Every one was now greatly alarmed, no one understanding what had happened, nor why the Indians were frightened, or enraged, whichever it might be. Mackenzie's people were absolutely panic-stricken, and it was all he could do to hold them together. They selected a position calculated for defense and distributed arms and ammunition.

Now followed a time of great anxiety. A young woman came to the camp, but they could secure no information from her. That night an old blind man was captured, returning to the house, having been driven from his hiding place in the woods by hunger. He was fed and well treated and soon regained confidence. Occasionally an Indian was seen on the river in a canoe, but none of them would approach nor reply to any call. At length Mackenzie decided to leave this place and to continue up the river. The canoe was absolutely unfit for service, and one man was kept bailing all the time, to keep her afloat. On the 27th they stopped at an island where there seemed to be on the mainland trees which would furnish the proper material for a new canoe, and here they stopped and built one. Here, too, their guide, who had deserted them at the time of the panic, returned, claiming great credit for keeping the promise that he had earlier made to them. On the 1st of July, however, he left them again, with his companions, going up the river. The old man they still had with them, but he was anxious to get away. The canoe having been completed and proving serviceable, they started up the river from this island, which they had named Canoe Island. It now seemed necessary to reduce the rations, again cutting the people down to two meals a day, which they did not at all like. Their food now consisted chiefly of the dried roes of fish, boiled with a little flour and grain, so as to make a substantial and not unpleasant dish. At Canoe Island flies had been very troublesome, so that Mackenzie says, "During our stay there we had been most cruelly tormented by flies, particularly by sand flies, which I am disposed to consider as the most tormenting insect of its kind in nature."

The way up the river was difficult, often impracticable for paddles, and it was hard to use a tow line on account of the steepness of the banks. On July 3 they reached a point which answered to the description of the place where they should leave the stream to go overland to the west, and here a river came in, which Mackenzie calls West Road River. Some of the men thought it would be better to keep on up the stream a little further, in the hope of finding an easier crossing, although at this point there was a beaten trail. They proceeded, therefore, and before long met their guide, who apparently had twice deserted. He was accompanied by some other Indians, called Nascud Denee, who were friendly, and who declared that from their village, a little further up the stream, the road to the sea was short.

On reaching the place where they were to leave the river, Mackenzie cached some pemmican, wild rice, Indian corn, powder and trade goods and also took the canoe out of the water, placed it bottom up on a platform and protected it as well as possible. They now started on their foot journey, carrying about 400 pounds of pemmican, the instruments, some goods and their arms and ammunition.

The journey westward was slow and difficult. They met many people, all of whom were friendly, and when their guide left them, as he did in a day or two, they succeeded in procuring other guides, for short distances, from the various villages that they passed and went forward with comparatively little difficulty, although the almost continuous rain was unpleasant enough. The people whom they met as they proceeded showed more and more evidences of intercourse with the whites, having a number of articles obtained by trade. Most of these people seemed to belong to different small tribes of Athabaskan stock. They seemed less and less surprised at the appearance of the white men

and, while still more or less astonished at their fire-arms, did not appear to be frightened by the explosions. Game was so scarce that practically none was killed, their provisions being largely fish, obtained from the natives or caught by themselves. The killing one day of two eagles and three gray partridges is important enough to be mentioned.

Mackenzie describes in considerable detail some of the houses of the Indians which he passed. He notes also, on July 14, that he had reached a place where it is the practice of the Indians to burn the bodies of their dead. On the 15th they fell in with a village of particularly clean and attractive people, who were on their way to the sea with articles for trade with the white people. They said that in view of the fact that the women and children with them could not travel fast it would be three days before they could reach the end of their journey. This was welcome news to the explorer.

Before they had gone very far, however, these people changed their minds, and determined to go to the sea by a different and somewhat longer route, and so the white men separated from them, having procured guides from four new Indians, who had just joined the party and belonged to a tribe Mackenzie had not yet seen.

The way was difficult, full of swamps and fallen timber. Ground hogs were seen, and a number of them captured, and before long a deer was killed. They were now high up in the mountains, and were marching through the snow. The country became very rough and they traveled along precipices, while snow-covered peaks frowned on them from above. On these mountains, according to their guides, were many animals, which, "from their description, must be wild goats." The timber grew very large.

On this day their guide hurried ahead, leaving the laden white people to follow, and when it grew dark the men were anxious to stop for the night, but Mackenzie pushed on, and at last reached a village where he saw fires with people cooking over them. He entered a house and shook hands, and the people directed him to go to a large house, where he was cordially received and fed with roasted salmon. A little later they were regaled on salmon roes, pounded fine, beaten up and flavored with something bitter, which we may conjecture to have been soapollalie. The natives here were capturing salmon with their dip nets and by weirs. They were kindly and hospitable, and had very strong beliefs and feelings with regard to their fish. Mackenzie declared that they never taste flesh, and that one of their dogs having swallowed part of a bone left at the camp-fire was beaten by his master till he disgorged it. A bone having been thrown into the river by one of Mackenzie's people, a young man dived, brought it up and put it in the fire, and then proceeded to wash his polluted hands. The chief of the tribe declined to let the white men have a canoe, because they had with them some deer meat, which, if put in the canoe on their river, would cause the fish to leave the river, so that the people must starve. Mackenzie asked what he should do with the meat, and the Indian told him to give it to a native present who belonged to a tribe of flesh eaters. The canoe was then loaned them.

These people seemed to belong to a different family from the Chipewyans; at least Mackenzie says their language appeared to have no resemblance to that of the Atnahs. Seven natives with two canoes took the explorers and their baggage down the river. They traveled fast, and the skill of the Indians greatly impressed Mackenzie, who says: "I had imagined that the Canadians who accompanied me were the most expert canoe men in the world, but they are very inferior to these people, as they themselves acknowledge, in conducting those vessels."

Just above a village the whole party landed, the Indians preceding the white men to announce their approach. When they reached the village they found it in a turmoil, the natives armed and rushing about apparently in a great state of alarm. There was nothing to do except to face the music, and Mackenzie walked boldly forward into the midst of the village, when most of the people laid aside their arms and came forward to meet them. He shook hands with those nearest to him, when suddenly an elderly man broke through the crowd and embraced him, as did also a younger man, the chief's son. Another son of the old chief approached, and as Mackenzie stepped forward to shake hands with him, the young fellow broke the string of a handsome robe of sea otter skin which he had on and put it over Mackenzie's shoulders. The chief took Mackenzie to his house, and treated him in a most hospitable manner. He was offered a dish made of the dried inner bark of the hemlock tree, soaked in fresh salmon oil. Food was plenty here, for the salmon run was at its height. Fish were drying on lines strung all about the village. These people were also very careful that nothing should be done to alarm their fish. They objected to water being taken from the river in an iron kettle, on the ground that the salmon disliked the smell of iron. Wooden boxes for holding water were given the explorers, however. Here were seen panels made of thick cedar boards, neatly joined and painted with hieroglyphics and figures

of different animals, such as are commonly seen on the coast.

Here Mackenzie was obliged to do some doctoring, and he describes the methods of the native physicians in treating their patients.

Mackenzie had several times asked the chief for canoes to take the party to the sea, but his requests had received little attention. When, however, he tried to take an observation the chief objected, not apparently because the natives were afraid of the instruments, but because their use might frighten the salmon from that part of the river. Just as they were about to embark in the large canoe, forty-five feet long, four feet wide and three and a half feet in depth, it was discovered that an ax was missing, and there was a short halt. Mackenzie's resolution procured the return of the ax, and they went on. Villages were seen along the river, and once or twice they stopped. The people they passed seemed to have more and more articles of European manufacture, and they treated Mackenzie very well. On the evening of this day, at a village where they stopped, Mackenzie says, "I could perceive, personally, the termination of the river and its discharge into an arm of the sea."

The Indians now seemed unwilling to go further, but two of them were persuaded to keep on, and, taking another canoe, about eight o'clock on Saturday, July 20, they left the river and reached an arm of the sea. The tide was out, and the large mud flats, seaweed covered, were bare. Gulls, eagles and ducks were seen. The weather was boisterous, and before long they put ashore in a cove for the night. One of the young natives here deserted, but, being pursued, was brought back. Since they had left the river porpoises and sea otter—or seals—had been continually in sight. Fresh water was had from streams running down the mountains, and just after dark the young chief from up the river came into camp with a large porcupine, which was eagerly devoured by the half-starved men. The next day they came across three canoes with fifteen people, one of whom seemed to have had some trouble with white men not long before. The people now met were somewhat annoying, for they begged, pilfered and seemed to wish to see everything that the white men possessed. They constantly spoke of a white man named Macubah, very likely meaning Vancouver, and for the negative, distinctly answered, "No, no."

On the face of a rock at this point Mackenzie inscribed, with vermilion, a brief note, "Alexander Mackenzie, from Canada, by land, the 22d July, 1793." Here also he was able to establish his position with some exactness, and this done he started to return. At a village near the mouth of the river a number of people rushed toward Mackenzie, apparently about to attack him, and it seemed that these were the ones who had been fired on by the white people not long before. Mackenzie stood ready with his gun, and the Indians, seeing his attitude, dropped their knives. There had been something of a scuffle, though Mackenzie was uninjured, and the Indians had made off with his hat and cloak. After a little while, the young chief returning, made an explanation that the men belonging to the canoes, which had met them below in an inlet, had declared that the white people had killed four of their party. An explanation that this statement was false brought about a hollow truce, but relations were still somewhat strained. The Indians brought them food, however, and gave them setting poles, all of which were paid for.

Mackenzie's people were very much frightened, and were determined to leave the canoe and to start on foot over the mountains. So firm was the resolution that they threw everything that they had, except their blankets, into the river. Mackenzie, however, with his usual patience and resolution, set to work to guide them in the right way, and declaring that now he had accomplished his object, he had no other object but the common safety that he wished to return in the easiest and safest way, and that one of their party was sick and could not travel, and that they must stay with him. The result of this was that his people agreed that they would continue to follow him; but a number of them declared that they would not again enter this canoe, of which they were much afraid. Five people, therefore, including Mackenzie and the sick Indian, entered the canoe, and made their slow way up the river. When they came in sight of a house they saw their young Indian, who had left them a day or two before, coming toward them, with six people, in a canoe. This encouraged them, as showing that the natives who had been spreading here reports about them had not been listened to. At this village they were treated well. At the main village above the old chief received them as cordially as before, and fed them on fish and berries.

Further up the river it appeared that a sick man, to whom Mackenzie had given some simple remedy, had died, and it was feared that the death might have been attributed to this remedy. Above this point they took again to the trail. They were very suspicious of the Indians, as the Indians were of them, and were constantly alarmed; and a panic in one party was succeeded by a panic in the other. At other villages they were kindly received, and various presents were given them, and Mackenzie devotes many pages to a description of the habits of these people. When they left the friendly village each man carried about twenty pounds of fish, and they also had a little flour and some pemmican. The sick Indian was slightly better, but could not travel fast, and in crossing rapids or difficult streams Mackenzie carried him on his back.

It was now the last of July, the weather was warmer, the grass green and the wild fruits ripe. High up on the mountains, though, the snow still clung, and the frost was hard. They were now marching fast, and as they went along they recovered, from time to time, the provisions that they had hid on their westward journey. On the 4th of August they reached the place where they had left their canoe, and found all their property in good order. There was not a foot-print near their cache. The Indians whom they met near at hand were frightened at first, but soon became friendly. Notwithstanding the fact that they had left the property of the explorer absolutely untouched, they took

away from the camp a variety of small articles which Mackenzie recovered by informing them that the salmon, which was their favorite food and necessary to their existence, came from the sea which belonged to the white men, and that since at the entrance of the river it was possible to prevent those fish from coming up it, the white man possessed the power to starve the Indians and their children. "To avert our anger, therefore, they must return all the articles which had been stolen from us. This finesse succeeded." On a Tuesday, the 6th of August, they embarked in their canoe on their return journey. The stream was full of salmon, and the work of pushing up the river was slow and difficult, but they were on the march toward home. Rains were frequent, but not long continued. On the 15th they reached the place where the canoe had been wrecked on the 13th of June, and made unsuccessful search for the bag of balls then lost. The following day they came to the Continental Divide, and it was here that Mackenzie had the thought of transferring some living salmon from the head of the Columbia to that of the Peace River. But, like most of his men, he was now in pretty bad condition from privation, excessive labor and cold, and he was unable to carry out the desire. On the 17th they carried across from the little lake to Peace River, and started down that stream. The passage was swift, and on the 18th they went down in one day what it had taken them seven to come up.

They were now again reduced to a short allowance of food, and Mr. Mackay and the Indians were sent ahead to try and kill something, while the remainder of the party began to repair the canoe and to carry the baggage around the rapid, which, on their ascent, they had called Rocky Mountain Portage. About sunset Mr. Mackay returned with the flesh of a buffalo, and we may imagine what the sensations of these northmen were when they again put their teeth into this familiar food. The journey down the river continued swift, and they were careful to land at the head of each rapids and inspect it, but the canoe being light they passed over most places without difficulty. The hunters killed fat meat, and Mackenzie gives an idea of the appetites by saying that the ten people and a dog, in three meals, ate up an elk.

On the 23d they were passing through a beautiful country full of buffalo, and on this day they killed a buffalo and a bear. On the 24th of August they rounded a point, and came in view of the fort. "We threw out our flag and accompanied it with a general discharge of firearms, while the men were in such spirits, and made such an active use of their paddles, that we arrived before the two men whom we left here in the spring could recover their senses to answer us. Thus we landed at four in the afternoon at the place which we felt on the 9th of May. Here my voyages of discovery terminate. Their toils and their dangers, their solicitudes and sufferings have not been exaggerated in my descriptions. \* \* \* I received, however, the reward of my labors, for they were crowned with success."

GEORGE BIRD GRINNELL.

## The Woman's View.

*My Dear Complete Angler:*

It seemed very queer to read your letter of cold and snow and sleighing while we are in the midst of the daily unfolding beauties of the spring. Our lawns are gay in green and gold, as Burroughs says:

"Dandelion's coin of gold is freshly minted on the lawn."

and the children, little misers, are eagerly clutching at the yellow treasure. I saw a magnolia warbler this morning, and a purple finch yesterday; our fruit trees are lovely in pink and white. Don't these things make you a bit envious?

Don't buy a ranch and stay out there forever. If you do I shall run away and hide myself in some vast wilderness and turn misanthrope; perhaps I shall lose my mind. I'll go to some lone mountain hut and live by myself, and some day I'll jump off a rock and the leaves will cover me, and no one but the bluejays will know what has become of me. Now, will you be good?

Violets have I, adder's tongue, arbutus, early meadow rue, bishop's cap, Jack-in-the-pulpit and columbine in my room to-day. I shall get up before breakfast in a day or two and go to see the columbines dance on the cliffs in the sunshine. The last time I was there (Ah! it was a year ago), I was not alone; I had a long, long tramp over the fields, ate my luncheon from a hill top at sundown, came home in the sweet April twilight and heard at dusk the woodcock's song, the whistling marmot and the bush sparrow. And everything I saw and heard was enhanced because I was not alone, and the memory of it all is doubly dear because I was not alone.

Now, I must tell you what a beautiful day I had yesterday.

Two enthusiastic fishermen who let Prudence and me accompany them on a fishing expedition a week ago, little thought what would grow out of their indulgence. We had enjoyed our outing and pretended to fish, but it was most tantalizing to be confined to the banks when the men waded the stream, and to be told that further down where they went there were no end of beauties and trout and adventure denied us who calmly meandered on the banks where the walking was good and where the trout disdained even to nibble at our bait. True, these same boastful fishermen came back that first day without a single trout to show for their long absence, but there was that in their faces that spoke of other things caught besides trout, and Prudence and I vowed a vow, and the next few days saw the fulfilment of said vow.

Accordingly, when yesterday, after a drive of twenty miles up in the wilds of Sullivan county to Serrine Brook, we reached that enchanting spot, Prudence and I mysteriously disappeared with sundry bundles from under the wagon seat; after some hesitation and much trepidation we emerged from our hiding place minus encumbering skirts, soberly clad in dark gray blouses and Turkish trousers, with high rubber boots and soft felt hats, armed for the fray with creel and rod. Never till then did I know the meaning of emancipation. To be able to wade that stream, to step boldly over logs, to go and come with-

out the hampering thoughts that always cling to the skirted creature, ah! how we exulted in our new-found freedom. No wonder men are called the lords of creation when they can stride over barriers insurmountable to the feeble being in skirts. Intoxicated with our freedom, I should have found delight enough in its realization had the day held no other pleasures.

We set out at 5 o'clock in the morning and were in the brook fishing at 9.

All day we fished except when we stopped for dinner. The long drive over the mountain there and back was delightful, and that brook! How you would have enjoyed it. Masses of rhododendrons on the banks gave it a semi-tropical look (like rubber plants and orange leaves), and the running water and the mossy stones and logs—every glance back was a beautiful picture.

I caught—took, I mean—four trout; two others got away before I could land them. They were all small; my largest one was not much over seven inches. We brought back twenty-six, none of them very big; we had to throw a lot more back that were under size.

Such quantities of arbutus as there were in the woods about us! but we were so consumed with the angler's ardor that we only gathered a little while going back to camp.

What a day it was! Out of sight and hearing of each other nearly all day long, except when we met at dinner, yet none of us thought of being lonely. I found myself singing once or twice in sheer delight with the scene and the solitude, singing while wading knee deep in that hurrying stream.

When I pulled out the first trout it was different from what I had expected. I felt quite calm, but found myself saying aloud, "Honestly?" I could hardly credit it—a real trout on my hook—but I proceeded to take him off as though I had done it all my life. Then the reaction came. By the time I began to rebait my hook I was so hurried and excited that it seemed I could never get that worm on. A worm never squirmed so before, I'm sure. I put my trophy on the bank near a wake robin, and feverishly returned to my fishing as though my very life depended upon it. It wasn't long before I took the second trout, then two little fellows got away from me, then we had dinner, and in the afternoon I got several bites—strikes, I mean—each one a distinct event which made memorable the spots where they occurred, and two more trout, and at 6 o'clock we came away. A bare outline as I look back upon the day. It seems a funny thing to spend all that time contentedly, and only catch four trout, but you know better than I can tell you how much else I caught—how full the beautiful day was. Oh, I caught a little green crab, too, and saw a garter snake, and found a yellow violet and some tiny white ones, and quantities of blue ones, and oh, the strawberry blossoms, and the arbutus—literally carpets of it—I found in a wood road that led back to where we met for dinner.

We built a camp-fire and had a gypsy dinner on the banks of the stream. Our horses standing near, the covered wagon, the blankets spread on the ground—these gave a touch of real gypsy life. And how good our coffee tasted, and the broiled chops! But we were eager to be done with dinner, appetizing as it was, and get back to the alluring stream.

I wanted to write to you about it all last night while the experience was fresh with me, but my aching eyes and an unwonted prudence stayed my hand. Long after I put out my light, until I fell asleep, I could see the varied pictures of the day—the shad blow's feathery beauty all along the mountains, the blood roots, violets and anemones in clumps as we drove by, the dandelions in the grass, the cowslips in the meadows, the plum and cherry and peach blossoms, and then up on the mountains the rocks and the bare trees, with the dark evergreens in scattered patches, and the frequent gleam of the shad bush in the midst of the brown and naked trees.

What a forlorn stretch of country up there in the mountains where the pole shavers dwell—a shiftless lot of people who live in hovels remotely scattered in the wilds. Such miserable, neglected looking children swarming at the doors and windows, too. They peered at us in curious timidity from eyes half hid by their tumbled, tawny locks. The hollows in the road over which we jolted were filled in with shavings from the poles. These people just manage to eke out the barest kind of subsistence at this work. It was depressing to think how poor and mean their lives are. What makes it so much more deplorable is that dwelling in the midst of this wild beauty they are blind to it all. If they had the compensation of sensing the beauty, one could feel that they were amply repaid for much that they lose—much that we feel so necessary to our existence, but no, they are utterly incapable of seeing and feeling all this which had been such a boon to me the whole livelong day. It was this that made me pity them more than anything else, more than for the poverty and the squalor of their benighted lives.

Of course, all that I experienced yesterday was novel to me, but an old story to you. Just go back in your memory to the first time you tried to manage a pole—rod, I should say—and a perverse fish hook, and the line that shows an aptitude for doing just the thing it ought not to do. Why, I had some of the most tantalizing experiences with my hook and line that are conceivable, yet I suppose every full-fledged angler knows all about similar experiences. It made me think of the title of one of the popular novels—"The Disentangled." I would get so exasperated, then the perversity of the thing would be so extreme that I was forced to quell my irritation and smile a grim smile as I wondered helplessly to what lengths such perversity would go. Many a time I found myself reflecting on the excellent practice in patience one could get from an attempt to fish for trout.

Of course, it is bad enough to catch your hook in stones or logs or grass so deep in the water that you have to bare your arm to the elbow and poke around till your fingers ache unbearably with the cold, to release your hook; and your frantic efforts to disentangle your line from rhododendron leaves and the tiny twigs and buds of overhanging branches; these are all bad enough, I'll allow, but you haven't encountered the worst thing that comes to you along this line until you have succeeded in hooking yourself in the trousers so far behind you that you are like a dog chasing his tail, as you twist and struggle to liberate that perverse hook. This I did twice

yesterday. It was maddening! How I tugged and tugged at that hook, but the serge of my bloomers is new and strong; it wouldn't give way, and all the time there were the most promising looking pools, while there I was self-caught—a most ludicrous sight, and miles away, for all I knew, from any one to help me. Finally, I bethought myself of my hatpin; with that I managed to tear, one by one, the strong fibres of those new bloomers, and to release myself from my own net. If the truth must be told, the greater part of my time was spent extricating myself from various predicaments. I had many a laugh at my own expense at the comical positions and situations I got in from time to time. The day was warm; my thirst was often extreme. Many a time I threw myself prone on the stones, or on a log, and drank from the stream. I got so I could do it without strangling, and how good it was!

Dear me! how I have reeled off this tale. When will you tire of your ranch life and come back to civilization? Come and go with me to Serrine Brook, and we'll see who is the better angler, the modern Izaak or,

Yours faithfully,  
MOLLY COTTON.

## Natural History.

### Feeding the Snakes in the New York Zoological Gardens.

In the reptile house in the New York Zoological Gardens, up in the woods of the Bronx, among the huge glass cages, where giant pythons and boa constrictors lie coiled, wherein the lazy diamond-backed rattler glides inquisitively toward the glass which separates him from the visitor, and where myriads of smaller snakes hang entwined in uncanny knots in the limbs of cage trees, there is many an extraordinary happening which a visitor to the house is not allowed to see. Only during certain hours of the day—usually between 9 A. M. and sunset—are admitted to the house the thousands of sightseers who on pleasant days come to look at the marvelous collection of snakes.

Interesting as the sight is during these visiting hours, it is really less so than at other hours when visitors are not admitted. When the snakes are on view to the public they are groomed, as it were, to show off, and are on their good behavior.

But once the doors are closed and the keepers are alone with the uncanny reptiles; when Curator Raymond L. Ditmars opens the glass door of the cabinet that contains his surgical instruments, and prepares for operations that are required for the good of one or another of the inmates; then, unless interest overcomes repulsion, the stranger, who, as a special favor, has gained admittance, longs for the open air.

But it is not only the occasional tooth which must be drawn from the jaw of a boa constrictor, or the occasional growth which must be removed from the mouth of the copperhead, the rattler, or the moccasin, which is gruesome; the very feeding of the animals is an uncanny thing to contemplate, especially when it comes to seeing them fed with their own kind.

Many snakes are snake eaters, as is generally well known. Those used for feeding the big fellows are all raised at the reptile house, except such as are added to the commissary department by men who hunt the reptiles in the woods of the park itself. Over four hundred garter snakes are now being raised by Curator Ditmars for the sole purpose of multiplying and furnishing food for the long, thin gullets of the larger snakes. Of the four hundred snakes intended for breeding food for the big fellows, about two hundred may be counted upon as adding from forty-five to forty-seven snakes to the collection each year. A total of over nine thousand garter snakes is thus secured as food for the big rare snakes, in whom life must be kept at any cost or sacrifice. This total does not include many hundred snakes of other varieties that are brought into the house by the hunters who catch them in the woods of the park.

"You'd think," said Curator Ditmars to the writer, "that a sixteen-foot boa constrictor would gobble up anything which happened to come near its terrible jaws, from a mouse to a young hippopotamus. As a matter of fact, however, the great snakes are choicest in their selection of food. They carry their epicureanism so far that they would rather starve than eat anything for which their delicate palates have no liking.

"To correct these suicidal tendencies the persons in charge of the reptile house have to resort to all sorts of expedient, even to violence, to make the snakes eat. Deprived of their natural food which, in the native state, consists of young antelopes, agouti, rabbits and other living animals, snakes in captivity do not take kindly to other sorts of nourishment. Rather than eat they will die.

"For months after they arrive it is impossible for us to get them to eat. As a rule, we let them go a long time before attempting to feed them. Of course, it is better if they will eat of their own accord. At times they take to the food rapidly; but I have had snakes at the reptile house which have not taken food for thirteen months.

"While starving themselves in this way they get thin and the natural gloss of their beautiful coats fades. The debilitated condition of the snake may bring on all sorts of ailments. Some get congestion of the lungs, others a species of diphtheria; some have skin diseases. When we think a snake is getting in bad condition from lack of food we have to stuff it.

"This is not so pleasant or easy as some might think. A twenty-five-foot python is not a gentle creature when handled. The muscles of these snakes are very powerful. The coils of a python could easily crush the life out of a horse. The weight and strength of a man—even of a Jeffries—would not count in a fight with a boa constrictor or a python."

The history of Curator Ditmars' efforts to make snakes eat is very interesting. When a large snake is brought to the zoological gardens it is placed in a cage and allowed to remain undisturbed for a week or two. Usually

it lies quiet for this length of time.

When it begins to manifest an interest in its surroundings, food is offered it in the shape of a plucked chicken on which the head and feet are allowed to remain. The chicken has to be absolutely fresh. Snakes are extremely fastidious in the matter of food, and should the meat be the least bit tainted they reject it at once. As every one knows, most snakes are fond of very young birds, and the plucked chicken is offered at first because it resembles a bird just out of the egg.

In a snake's delicate tongue seem to reside all his sensory organs except that of sight. The snake whips out his tongue with lightning rapidity and ascertains whether or not his food is fresh. If his preliminary investigation proves satisfactory, he goes ahead with his meal in a very leisurely fashion.

The chicken is swallowed whole, as snakes do not masticate their food. The powers of accommodation possessed by their jaws, however, is something marvelous. A snake can easily swallow an animal four times its own diameter. In fact, boa constrictors manage to get into their throats even fair sized deer and other large animals.

In killing the prey in their native state they constrict it tightly in their folds until all movement on the part of the doomed animal ceases. The popular idea that they first crush the bones before beginning the swallowing process is erroneous.

Mr. Ditmars has observed some very remarkable phenomena in connection with the digestive powers of the large snakes. It seems that the gastric juices of their stomachs are so powerful that they dissolve even the bones and teeth of the animals they have swallowed. A peculiar fact is that on occasions when the snake has accidentally swallowed one of its own teeth the tooth will be found undigested; whereas the teeth of its prey always disappear in the snake's digestive process.

When a valued snake in the New York Zoo refuses to take kindly to plucked chicken, and lets months roll by without any evident intention to eat, no matter how enticing the food which is offered it, measures have to be taken to prevent it from committing suicide. Usually large snakes are placed in cages with several others of their kind. It is a difficult matter to extract from his cage one of the snakes without exciting the others.

The greatest precautions have to be taken by those conducting the food-compelling operations. Under Curator Ditmars are assistants Charles Snyder, Frederick Dahl and George Stockdale. It is the province of the first named assistant to enter the python cage and throw blankets over the heads of the snakes which are not to be fed.

This task is not free from danger. Aside from the fact that the snakes might envelop the man in their coils, the man runs great risks from bites. The bite of the python, anaconda, and others of his class, is not poisonous, but it is very painful.

These snakes have well developed teeth and powerful jaws. There are four rows of teeth in the upper jaw and two in the lower. The teeth are very sharp. When a boa constrictor bites he shuts his mouth tightly and pulls back with his strong neck muscles. This tears the flesh and makes a frightful wound.

Watching his opportunity and ready to leap from the cage at the slightest sign of danger, Assistant Snyder throws a small gray blanket over the head of each snake. As soon as the snake's head is covered by the blanket he remains quiet, as a rule. There are times, however, when the snake resents being blanketed in this fashion, and insists on popping his head out as soon as the blanket touches him. At times it takes several hours to get the heads of the snakes covered.

When the snakes have been covered the one to be fed is seized by the body just back of the head. With a remarkably quick movement the head of the snake is then drawn from the cage.

As soon as the snake has been pulled from his cage he begins to resent the treatment. His coils mount up with wonderful rapidity. At this point, Assistants Dahl and Stockdale throw themselves upon the reptile and prevent him from constricting. The greatest care has to be taken in performing this task in order not to let the snake get the folds of his body about any of the men.

They keep well outside the terrible circles by jumping over the snake's body whenever he gets them in "chancery," as it were. This often requires a nimbleness on the part of the assistants which would be almost laughable were it not so fraught with danger.

When the body of the snake has been drawn entirely out of the cage, from twelve to fifteen other men throw their weight on the folds of the snake and compel it to remain in a straight line.

The snake is then carried out into a large room in the reptile house, where its enforced meal awaits it. Usually a meal for one of the big anacondas or pythons consists of five or six guinea pigs strung together. They have been killed and soaked in water previous to the feeding hour. The guinea pigs are attached to a long pole. The jaws of the snake are forced open, and this pole, with the pig's attached, is thrust down the snake's throat. When the pole has passed down about one-sixth of the snake's length, it is withdrawn minus the guinea pigs.

Up to this time the snake has offered very little resistance, save for the first rebellious paroxysm. Now, however, he begins to assert himself very forcibly. He makes desperate efforts to rid himself of his meal by a series of convulsions which would do credit to any contortionist. It seems to an onlooker as if he were trying to tie himself in knots, from a half hitch to a "granny." The fifteen men are swayed about as if they were mere children. It requires all their combined force to keep the reptile straight. If once he is allowed to draw himself into a knot coil all the feeding has to be done over again.

After about five minutes' of strenuous effort to free himself from the hands of his captor the snake seems finally to reconsider his decision not to swallow his food. One can observe the guinea pigs go down through the body of the reptile in the form of a great lump. When it has reached about half the length it comes to a standstill.

The snake is now taken back to the cage. The door is opened and the head of the snake is thrust in. The rest of his body is forced in after him, and the door is closed with a sharp snap—sometimes just in time to prevent the other snakes from darting out; for, while the absent snake is being fed, they usually emerge from their blankets and

are on the *qui vive* for a chance to get out as soon as the door is opened.

When the fed snake finds himself back in his cage he begins to take life easily once more. In one corner of his abode is a tank of water. Into this he crawls, coiling his folds about until he lies in a compact heap, with his head beneath the surface of the water. Here he will remain, occasionally coming to the surface to breathe, for many days. He is digesting his dinner. This is a rather slow process.

Several of the larger snakes in the collection are fed in this way about once every ten days. After two or three compulsory feedings boa constrictors begin to take to their food naturally. They will eat, when they have become used to captivity, rats, mice, chickens, rabbits and small birds and animals.

[TO BE CONTINUED.]

## Short Talks on Taxidermy.

### II.—Skinning the Bird.

It is not well to begin to skin a specimen immediately after it has been killed. It should lie for an hour or two, in order that it may cool and the blood and other juices of the body somewhat harden. If the bird is skinned too soon, the blood is likely to flow freely, and to make more or less trouble by wetting and soiling the feathers. You will provide against an undue amount of moisture in your specimen by having at hand a saucer or small dish of fine corn meal, which is to be sprinkled over—and will dry up—any moisture that makes its appearance.

A small pine table is good to skin on, and it is well to spread over this an open newspaper, which, at the end of the work, can be rolled up, with all the loose feathers, bits of flesh, scattered poison, etc., in it, and then can be thrust into the kitchen fire. Of course, one can skin a bird on his knee, or on pretty nearly any support when he knows how, but it is just as well to work, at first, at least, in the way which is easiest.

Suppose that you have returned to the house, have spread out your various implements on the table; have your specimen now cool and rigid before you. Look closely at the bird as it lies there. If you are going to make a skin, your ambition should be to so prepare the specimen that it will look as nearly as possible like the dead bird. Note, therefore, the appearance of the bird as it lies on its back. Its bill neither sticks straight up in the air, nor points directly out in the line of the body, but is turned up at an angle of 30 or 40 degrees with the horizontal. The bird is plump and round throughout, but the breast is fuller than the belly. The points of the wings almost meet under the tail, and the feathers of the sides of the neck and breast cover the margin of the wing at its bend and part way back to the tip. If you turn the bird on its side you will see that the back is not flat from side to side, but is rounded, and that when the bird is lying on its back the shoulders do not fall down and rest on the table, but stand up above it. The sides of the head about the eyes are more or less flat, yet the eye itself is full. If your skin is to be a good one it must resemble the dead bird.

After you have considered the specimen and have its form pretty well in your eye, you may as well begin to take off the skin. The stiffest and longest parts of the bird, and those least easy to handle, are the wings. For convenience in handling, it is customary to break the wing bones close to the body, except in cases where it is desired to mount a bird with spread wings; but we are now talking only about making skins. For a small bird you may, with your forceps, or your pliers, crush each wing bone close to the body on either side. Now place the bird on its back on the table, lying so that you can conveniently use your right hand in skinning. Some of the books recommend that the bird's head should be directed to the left; others, that it should point away from you. It really makes no difference, the desirable point being that it should lie so that it is most convenient to your hand. The feathers of the breast and belly must be parted by the fingers of the left hand, if you are right handed, and the naked skin exposed. Take your medium-sized knife, one with the blade not over two inches long, and make a cut from the middle of the breast bone down toward the tail, until you reach the vent. Since you merely wish to separate the skin from the body you should try to cut only through the skin. Over the breast muscles, where the cut begins, it makes very little difference whether you cut deep or not, but when you have passed beyond the breast, and are cutting through the skin over the belly, you must make short strokes, otherwise you are likely to cut not only through the skin, but through tissues covering the belly, and even into the intestines; and if you do this you will set free more or less fluid matter, which will be in your way and will very likely soil the feathers. If an undue amount of moisture appears, scatter a pinch or two of the cornmeal over it, and this will keep the fluid from spreading.

When you have cut down to the vent, take the skin on the left-hand side of the cut in your thumb and finger and lift it up, and then introduce the flat handle of your scalpel, if this is the implement you are using, and work it around, backward and forward, pushing the body of the bird away from the skin. With a little practice you can do this very quickly, and with entire safety to the skin; whereas, if you use the edge of the knife, you may either cut the skin, or cut more or less flesh from the body, which will afterward have to be cleaned off from the skin.

After you have worked the skin away from the body you will see just about opposite the posterior end of the breast bone the knee of the bird sticking up inside the skin. Take hold of this, either with the right-hand fingers, or with the point of the knife and the thumb, and with the forefinger and thumb of the left hand work the skin down toward the foot, always pushing the skin, never pulling it; then cut the leg off at the knee joint, either by pressing with your knife against your thumb, or with the scissors, and cut the flesh through to the skin. Be careful, however, not to cut through the skin. This can be avoided by holding your left forefinger under the skin, while the thumb holds the leg below the knee; then as the knife is pressed down through the flesh toward the

skin you will feel it on your left forefinger, and can avoid cutting too deep.

Now, turn the bird around end for end; that is to say, if, when you began, it lay with its tail toward you, now turn it so that it lies with its head toward you. Or, if when you started the head was to your left, turn it around so that the head points to the right, and perform on the other side of the bird precisely the operations that you did before. When you have completed them, both the legs are cut off. Now, taking the bird in your left hand, place it on the end of its breast, with the back toward you and so that the tail sticks straight up in the air. Bend the tail over toward your body, introduce the point of your knife under the tail bone, that is to say, just in front of what would be the pope's nose in a turkey, and placing your thumb on the bone, cut through it. Do this carefully, and above all, do not put your knife in deep enough to cut the skin on top of the tail, and do not be so violent in cutting through this bone as to permit your sharp knife to cut your thumb. For this cut the scissors may be used, but even with them you must be careful not to cut the skin over the tail.

Now push down the tail and its attached skin, and you will see that it will begin to slip easily from the almost fleshless bones of the back. You should hold the tail bone between thumb and forefinger of right hand and push the skin down the back with the left.

Beware of pulling the skin under any circumstances. In working it down over the back either use your thumb nail or the handle of your scalpel, and do not work in one place only, but push the skin down evenly all around the back and sides. You will find that it will go very easily, and before you know it the tail bone and the thighs will be free from the skin. It is easy to keep working the skin down until the neck near the body and the wings are free. The wing bones having been broken, the wings are attached to the breast only by some strings of muscle, which are to be cut through. Then, holding the bird's body in your left hand, grasp the inside of the skin on both sides of the breast between the right thumb and forefinger, press the two flaps of the skin together, and holding them firmly, move the hand down toward the head, and you will see that the skin will strip smoothly and easily from the breast, and your whole bird skin, turned inside out, will be hanging to the body by the bird's neck.

Still remembering not to pull on the skin in any way, put your right thumb and fingers close around the bird's neck bone, and gently shove the skin down toward the head. It will slip along, and finally turn over the head, just as a glove finger turns inside out, until presently you

will see the back of the bird's head, and the skin will hang to the carcass only by certain attachments about the head.

It must be remembered that this cannot be done with all birds; for ducks, woodpeckers, and some other birds, have the head too large—or the neck too small—to be turned inside out in this way. Mention will be made of this later.

The two most obvious attachments of the skin to the skull are now the ear membranes, which run back into the ear cavities on either side of the back of the skull. These must not be cut, but should be seized between the thumb and finger nails, close to the skull, and pulled gently out. They may tear, but if the work is done carefully they will not tear much. When both are loosened, the skin will slip down a very short distance, to catch again at the eyes.

The removal of these is somewhat more difficult, for care must be taken not to cut the eyelids, and not to cut into the eye, which is full of moisture that if broken will run out through the bill and may ruin the skin. Either with your forceps or with your finger nails, lift the skin away from the skull, and cutting close to the skull, directing the edge of your knife forward, you will soon cut through the tissue which unites the eyelid and the eye, and after you have done this it is easy to continue cutting this tissue, and to avoid touching either of the delicate parts. Do the same thing on the other side, and then push the skin down to the bill. Then take the handle of your scalpel and thrust it into the eye socket, just in front of the eye, and scoop the eye out. It will come easily, and no great force need be exerted. The same thing is to be done on the other side. Then, with the blade of your knife, cut the neck off close to the skull; or, if the bird is small, cut away the back and under part of the skull, without, however, interfering with the jaw bones. If properly done enough of the skull will be taken away to permit you to introduce into the brain cavity either the handle of your scalpel, or a flattened stick, with which all the brain must be removed. If there is much flesh about the jaws, or the roof of the mouth, remove it by taking your scissors and cutting out a triangular slice of bone parallel with the jaws. The point of the scissors should be introduced just within the mandible at the back, and a cut made parallel with the mandible, and reaching forward to below the eye. A similar cut on the other side will meet the first one, and the wedge of bone with its adhering flesh can be lifted out. Your skin is now free from the body, and needs only to be cleaned, poisoned and turned back again.

AMATEUR.

[TO BE CONTINUED.]

### A New Dusky Grouse.

In Vol. XX. of the Bulletin of the American Museum of Natural History, Mr. Frank M. Chapman, Assistant Curator of Birds and Mammals in the Museum, describes a new grouse from California. This is a hitherto unnoticed form of the dusky or blue grouse, to which Mr. Chapman has given the name of *Dendragapus obscurus sierræ*; the blue grouse of the Sierra or high mountains. The new form differs from the sooty grouse in being much paler above, but with heavier cross markings of brown and gray above, in the practical absence of neck tufts, whiter throat and paler under parts. Its range is given as California, in the forested portions of the Transition and Boreal zones, east of the humid coast belt and south from the Sierra to Mt. Pinos, north to Fort Klamath, Ore.

Mr. Chapman has made an extensive comparison of this new form with the older ones, and concludes that although the Sierra grouse more nearly resembles *obscurus* than it does *fuliginosus*, it apparently has been derived from the latter rather than from the former. In other words, it represents the southern extension of the north-west coast form and not a westward extension of the Rocky Mountain form.

### What Bird is This?

KALAMAZOO, Mich., April 28.—*Editor Forest and Stream*: I notice a query in your Natural History columns by F. M., "What Bird is This?"

We have the greater and least bitterns in large numbers in this neighborhood. In the spring—their breeding season—they make the peculiar noise F. M. speaks of. They can be heard a great distance, and the cry sounds like a person throwing rocks in the water very rapidly. Some of my neighbors call them pile drivers. I have never been able to see them when they go through this performance.

A. R.

### What is the Egg?

BROOKLYN, N. Y., April 29.—*Editor Forest and Stream*: The egg mentioned by J. L. Davison in this week's issue would seem to be that of the English starling.

No end of these birds have wintered in New York city for several years, and while I was not aware that the starling's range had extended so far as Lockport, it is not improbable that a few birds have wandered that far.

Like its fellow winter resident, the English sparrow, the starling seems to be getting into the habit of breeding early and often.

H. S. A.

### Condemned to Death.

My doctor had just left me. He had been with me for two hours. He had examined me thoroughly and scientifically. He had tried to be kind. He wanted to get away without telling me, but I had cornered him, and demanded to know how I was and what was the matter with me. I had fainted in my office and been carried to my rooms the day before. Finally he told me, in the kindest way possible, that I had not over a month to live. I asked him why, and what was the matter of me. He said, "You have burnt yourself out. You have overworked. You could have saved yourself if you had quit a year or six months ago, or even three months ago, but you are almost gone, and have one kind of consumption." I asked if there was no hope. "None," says he, "the days of miracles are past." We had been close friends, the Doc. and I, and I saw tears in his eyes. He took me by the hand, looked me long in the eye, and then went away silently.

I lay on my couch dazed. Where were my great financial ambitions now? What would my prospective millions be worth to me now, if I had them? Suppose that I had lived on ten, twenty or thirty years more, and piled on to the ample fortune that I already had, and was then facing what I was now? What would it all be worth to me? Nothing. I would then regret that I had not taken some pleasure in life, and that I had not taken time to bring round me a home and more friends. Then my thoughts ran on, and I saw that I had already made just as bad a mistake, although the figures were not quite so large. Here I am, thirty-eight years old, with no family and no relatives to speak of; wealthy, respected, and well known in the business world, and condemned to die. I would give it all to exchange places with a strong, healthy working man, that goes home to his family at night satisfied with his life. Well, I can soon get ready to go. An hour with my lawyer to-morrow, a few papers to sign, a few friends to see, and I will drop out, and a few days later I will be forgotten. Then I drop away and sleep.

I dream, and again I am a boy at play on my father's farm. I am in the forest, silence is around me; even the birds are still. How sweet the air, and how beautiful the colors. This is surely rest, and such satisfying rest. I breathe in the fragrance, and sleep on. Some one speaks and I awake. It is the doctor. His kind heart has called him back to me. He tries to look

cheery, and says, "Well, old man, how do you feel now?" "Wait," I reply. Then, as I came out from my sleep and my dream and to myself, it seemed that I could still smell the fresh grass and green leaves. I sighed, "I feel better since I went to the woods." He glanced at me and smiled. "So you have dreamed," said he. "No," I replied, "I really went." We were both silent for some time, then a new resolution took hold of me. "Doc," I says, "if I have got to die I am going to die in the woods, and the farther back in the woods the better I shall like it, and I want to be buried right where I die." His reply was, "If you had done that three months ago you would have had a chance to live." So it was fixed. My lawyers came. I signed a will, naming some far away cousins and some, no doubt, good charities, of which I knew nothing. Deeds were signed and a telegram sent to a long, gaunt man that I had hunted with in the north, and he came, and he and I started on a long trip. We finally stopped, and high mountains were all around us. A buckboard and team with driver were there, and we drove for several hours through gorges, over hills and in beautiful valleys, where all was green and the sparkling water laughed in the bright sunshine. Then we stopped at a rude but beautiful log house. A big man with a great beard came out, and a gentle, kind-faced lady took me by the hand and said, "Welcome," and I was at home.

Then began my first real life. My long Yankee friend, whom I will call Joe, took me in hand. We walked out early, and Joe would not let me sit down till I told him I was tired. Then more walks. Later on he took along a trout rod, and I fished for trout. And such trout as these were. Joe had a faculty of keeping me interested in something; he never seemed to give me time to think of myself. One week went by, and I had not had time to think much about dying. Another week, and I could feel myself stronger. With my hand I felt the muscles of my legs and shouted, "Joe, I am not going to die." A broad grin spread over his face, and he said, "I've knowed thet fer a week." Could it be true? Joe urged care and going slow, and we went slow, but each day increased our walks, and finally a rifle was added to the trout rod, and then came life in earnest. A deer was shot. As I gained in strength, higher up the mountain we went, and an elk dropped before my rifle; and I realized that I was a well man again, and far stronger than I had ever been before. But what a change had come over

me. I had no desire for the old life. In fact, I had a dread of a thought of the city. The forest had saved me, and I belonged to the forest and the mountains. The waterfalls called me, the rocky streams talked with me, and the green earth welcomed me to my proper home.

Out on the plain where two rivers meet there is a ranch. It is mine and Joe's. He has a cottage there, and cares for the cowboys and me. In his home he has a prim New England wife, and two fine boys toddle round his knee. We are happy. There is not a stronger man or better rifle shot for miles around. I weigh 190 pounds.

Last fall I sent for Doc. and he came. I met him at the train on a wild bronco. I tried to shake his arm off, and shook till he plead for mercy. I offered him a bronco to ride home, but he looked the bronco over, and begged so hard that I let him ride in the buckboard, while I rode along and showed him how a "corpse" could ride.

Mrs. Joe is calling us to supper, so I will say So Long.

"LYONS bones have no marrow in them, and are so hard that they will strike fire. Their neck is made of one stiff bone, without any vertebrae. They have five claws on the hinder foot, and the balls of their eyes are black. Lyons eat but once in two days, and drink in like manner. Formerly in England a Lyon could tell noble blood from base. There is a variety of Lyon with human faces. As for the rest, the tail of a Lyon is very long, which they shake oftentimes, and by beating their sides therewith they provoke themselves to fight. The nether part of this tail is full of haire and gristles, and some are of opinion that there is therein a little sting wherewithal the Lyon pricketh itself."—Four Footed Beastes, 1607.

"THE camel hath a manifold belly, either because he hath a great body, or, because he eats Thorny and Woody substances. God hath provided for the concoction. Puddle water is sweet to him, nor will he drink of river water, till he hath troubled it with his foot. He lives a hundred years, unless the Ayre agree not with him. When they are on a journey they do not whip them forward; but they sing to them, whereby they run so fast that men can hardly follow them."—Four Footed Beastes, 1607.

## Origin of N. A. Mammals.

FROM the Eighth Annual Report of the New York Zoological Society is reprinted, and issued separately, a paper of much interest to naturalists and big-game hunters. This is "The Origin and Relationships of the Large Mammals of North America," by Mr. Madison Grant, Secretary of the New York Zoological Society. It is a brief review of the living large mammals of the United States and Canada, and an attempt to trace their past history, the continent of their origin and the time of their reaching the new world.

In many respects there is a close resemblance between the faunas of the new and the old world, but even where the resemblance is most close, American naturalists—differing in this respect from those of Europe—believe that there is never specific identity—except in some circum-polar forms.

It is to the paleontologists that we must turn for information about the ancestry of existing mammals. This science has in many cases given us definite proof of descent, not only in the well-known case of the horse, but also in a number of other groups. Mr. Grant tells us of the radiation of certain groups of primitive mammals in the early tertiary, of the development and specialization of these groups, and the decline of the extraordinary and highly specialized types which has been evolved.

At the very last of the tertiary and beginning of the post-tertiary or pleistocene, the fauna of North America was numerous and varied, including camels, horses, ground sloths, elephants, and many carnivores, among them the sabre-toothed tiger. Most of these were swept away by the glaciers which followed, but Mr. Grant believes that the common deer, the pronghorn, the peccaries and the raccoons—distinctly American types—are survivors of this fauna. During tertiary time, at various intervals, broad land connections are believed to have existed between North America and the continent of Europe and Asia, over the present Bering Sea. Over such a land bridge animals might readily have passed in either direction.

The original home of the wapiti, for example, was probably in Asia, where to-day exist forms so like the American elk that they are called by their describers sub-species of *Cervus canadensis*.

The means by which animals may have reached this continent are migration by possible land bridge over the Atlantic, migration from South America, development in North America and finally—most important and most probable of all—migration from Eurasia by way of the Bering Sea. Mr. Grant believes that the raccoons, the peccaries, the pronghorn, and the typical American deer known as *Odocoileus*, all originated in North America; but the remaining large mammals, the wapiti, bison, muskox, mountain sheep, mountain goats, many cats, including the lynxes, bears, otters, wolverine, fisher, martin, mink and beaver, are all more or less recent immigrants from the northern continent of the old world. These animals are nearly all of them of northern or sub-arctic habit, and from this is drawn the inference that the land connection between the continents lay far to the north. That this land connection persisted until very recent time is inferred from the close relationship of North American mammals with the old world forms.

Mr. Grant takes up the different groups of animals and discusses them at considerable length, and his paper will be found very attractive by all who are interested in our mammals.

## His First Partridge.

A FARM lay nestled among the hills bathed in the hazy sunshine of an October day; five happy, joyous boys, brothers, started from the old farmhouse on that lazy autumn day to husk corn in the field. The eldest of the lads, about twelve years of age, carried a small shotgun, two of the youngest carried a tin pail filled with apples to appease the hunger which the arduous labor they were about to begin, of husking corn and killing mice in the cornfield was sure to bring.

As they started, their father asked the eldest what he was going to do with the gun. He answered that he was going to try to shoot a hen-hawk that was in the habit of alighting on an elm tree which stood in the meadow near the cornfield. If that father could have read the boy's mind he would have discovered that his real object was not to shoot but only to try to shoot the hen-hawk, as he well knew that he could not get within gunshot of the hawk while on the tree in the meadow, but that he sought to shoot a partridge that was in the habit of drumming on a log that lay on a wooded hillside near the cornfield. To have admitted that he desired to hunt partridge might have implied that he would neglect his work at husking corn, and in that view his father might have told him to leave the gun at home. Hence the hawk story.

The boys joyously started for the cornfield, gun and all. They had not been many minutes at work before the hawk soared and circled above their heads, and descending alighted upon the elm in the meadow. Now was the opportunity; gun in hand, the boy started toward the hawk, but before he had gotten within forty rods of the tree the hawk again soared, circling high up in the sunshine. The boy at once hurriedly dived into the brush on the hillside.

He well knew where the log lay. Many times he had listened to the drumming of the bird on that log, had sat upon the log, seen stray feathers and the droppings of the bird; had even seen that proud bird strutting back and forth on the log drumming in all his glory, and had heard the whirr of his swift wings as he flew away. He had longed and longed again and again for the time to come when he could have a gun and make that bird his own. He traversed a broad circle and approached the log from the bottom of the hill, worked cautiously up the hill toward the log, his heart full of nervous anticipation wondering if the bird would be there. At length he came within sight of the log. Carefully he raised his head above the twigs and leaves that surrounded him and what a sight met his gaze. There on the log sat the bird, craning his neck first on one side and then on the other to see what caused the noise made by the approaching boy.

Immediately the boy's eyes became twice their natural size, his heart leaped into his throat, he almost ceased to

breathe, and although he was within easy gunshot of the bird, he instantly resolved—through fear that he might fail of his mark—to get nearer. He dropped on his knees, crawled behind a large hemlock tree a rod or two nearer the log, again raised his head for another look. There sat the bird still craning his neck.

By this time the boy had ceased to breathe, his eyes fairly bulged out of their sockets, his heart thumped so loudly against his breast that he feared the sound it made would frighten the bird away. Although he had scarcely strength sufficient to do it, he raised the gun to his shoulder, closed his left eye, looked over the barrel of his gun with his right, aimed at the bird, pulled the trigger, and, to his utter astonishment, the bird fell backward off the log.

Then commenced a scramble through the brush to get the bird, and although he was no more than forty feet from it when he fired the gun, he stubbed his toe and fell upon the ground at least three times in making that distance. At last he tumbled over the log from which the bird had fallen, and fell, panting and exhausted, prostrate upon the ground, the expiring bird beating the ground with its wings by his side. Oh, joy! Oh, happiness complete! He had killed his first partridge. His hand was upon the bird. He held it in his arms. It was his—actually his own.

As soon as his heart ceased palpating and he had recovered his strength sufficiently, he started on a rapid journey to the cornfield to show his trophy. Only a short stop was made in the cornfield, the work of killing mice, roasting apples and potatoes in a bonfire and husking corn instantly ceased, and five boys ran, shouting with glee, back to the dear old farmhouse again.

Reader, if you were born upon a farm and spent your childhood there you know the happiness of such a day. To roam through the woods with dog and gun, to climb the hillsides' gentle slopes, to lie upon the ground in the soft shadow of the trees, dreaming of the wonders that he would some day perform, to be startled from his reverie by the unexpected whirr of a partridge's wings or to be aroused into sudden energy by the point of the dog; these were the joys that came to that boy after that eventful day, the recollection of which still brings to his memory most exquisite charms. Many a bird fell and many a bird escaped at the crack of his gun; but, hit or miss, the love of the pursuit never left him. In after years during the struggle and turmoil of a busy life, surrounded by greed and contention, he looks back to the joys of those innocent peaceful days as something almost heavenly. To have had parents who knew only good, and sisters and brothers whom he loved beyond the power of expression who shared his pleasures—sorrows he had none—was his lot in youth, the memory of which softens his heart and awakens its best impulses. In many of the most bitter struggles that came to him later, when discouragement and despair almost destroyed all hope in his soul, the memory of those days—those happy days of his youth—returned like a sweet dream to restore again his drooping courage.

HENRY F. COUPE.

## Deers' Powers of Scent.

LAST summer the question of the power of scent in animals was discussed in FOREST AND STREAM, and I was tempted to join in the fray, but the subject seemed to be in the hands of those of greater experience than mine, so I kept out of harm's way. But now that I have the time to write, as I did not then, and as Jack Frost has probably checked the blood thirst of those who raised their manes and lowered their horns against each other over Kipling's lines, I dare make a report of one instance that five deer showed conclusively that they possessed the power of scent.

In the spring of 1897 I with others was engaged in digging prospect holes in the quartz rocks of the Boar Tusk group of mountains in Polk county, Arkansas, seeking gold and silver, and four of us lived in a 12 x 16 board shanty, from January until July, in the heart of the woods and mountains.

About the last of March we sunk a prospect hole upon a quartz lode, four miles from the cabin, and as the leaves were filled with wood-ticks, and partially hid the snakes, we burned the country over one very damp foggy morning, and following our blazed trail we started to make a path to and from the cabin. On the fourth morning after the burning of the leaves three of us had passed over the trail and had reached the foot of the last mountain we must cross to reach our work, when we sat down upon a log to take a short rest before climbing the mountain side. While resting one of us saw five deer about half a mile further north, on the side of the mountain, slightly below us, to which he called the attention of the others, and then we silently watched them as they came up within an eighth of a mile of where we were, and then turned off at an angle and walked away from us to a distance of a third of a mile, when their course led them to the trail we were making. With loud snorts from some of the herd they all stretched their necks and put their noses to the ground, and then one took the lead and with nose close to the ground took the trail and started toward us, the others following, all seemingly following the scent of the trail like a well-broken dog about to flush a quail, stepping slowly, as if ready to come to a point at any moment. In this manner they came up within thirty yards of where we were sitting, when the trail, turning around the top of a fallen tree, and when they were almost in a line with us on the log, a slight breath of air from the mountain side passed from behind us direct to the deer, then up came every head, and no dogs in the hunting field ever made finer points than those deer made on us, standing like statues for probably one or two minutes, until one of the party said, "I'm going to throw a rock at them," and reached for one. At this the herd broke from their point, and ran off about 100 yards, and then all stopped and faced us again, but on the movements made in throwing the rock they all turned and loped over the hill out of sight. This herd consisted of three old ones and what we judged to be two yearlings, three does and one large and one small buck, and the strangest thing about their actions was that the largest buck was following the smaller one,

and the last one upon the trail, while the does were all in front of the bucks, with the largest one in the lead. Why they acted as they did, unless they did not follow the scent will have to be explained by some one who understands deer better than

W. F. R.

## A Hunt in Costa Rica.

THE afternoon of an October day, 1902, found me at Las Lomas station, a small village on the railroad line running from Port Limon to San José, the capital of Costa Rica, Central America. This was to be my starting point for a trip into the southeastern part of Costa Rica after peccaries (wild pigs), and any other game found in this locality. The way was to be through the jungle, filled with swamps, poisonous snakes and wild animals, with here and there an Indian village.

Las Lomas boasted of a few huts and a commissary, to the manager of which I had a letter asking him to find me two reliable men to pack my things and act as guides. That night I spent at the commissary listening to stories of adventures with animals and venomous snakes, among them the deadly coral snake, with which, later on, I formed a closer and dreadful acquaintance.

The next morning found me up before daybreak. My two men were ready. They were Jamaica negroes, and both good hunters. I would rather have a good Jamaica negro than a dozen native peons. They are trustworthy, interested in the work, and cheerful companions on a hunting trip. I had with me one 12-bore shotgun, a .30-30 carbine rifle and a pistol, beside the long knife or machete always carried in that country.

The first half day was easy going, as we followed well beaten paths through large rubber plantations. No game was seen, but occasionally a beautiful toucan or some other bright tropical bird flashed across our path, and we heard the call of the wild turkey off in the distance. This is not the turkey of the north, but a much smaller bird of dull plumage with a small head and shrill call.

After leaving the rubber trees, the going became harder. Here a small stream was to be crossed, there a large fallen tree to be clambered over—a tree quite unlike those of the north, being covered and wrapped with creepers and foliage in every direction. When one of these trees falls it carries down this mass in a grand jumble, which continues to live and grow. You may judge how vegetation thrives in the tropics when by actual calculation and measurement a wild bamboo has been known to grow twenty-four feet in nineteen days, and a wild banana tree eight feet in six days. Under such conditions one can see what a dense thicket is formed by the falling of a tree 150 feet high.

In places such as this one man advanced and cut the tangle of creepers even waist high, the others followed, sometimes crouching, other times creeping on hands and knees, but always with eyes wide open to guard against poisonous reptile or spider. This continued till almost dark, and it was then time to look for a camp for the night. At last a place was discovered on a small hill and fairly clear of undergrowth. After leveling with our machetes all the growth over the space needed, the two men cut down some black palms, made a lean-to, and covered it with palm leaves. They then collected enough wood to keep the fire going, and spread down rubber blankets and coverings. The camp being ready for occupancy, some coffee, bread and a can of corned beef brought from the commissary made up our evening bill of fare, and after a pipe full everybody turned in. The day had been a hard one, and we wanted to rise early and start by daylight.

Our troubles now began. I was almost in the arms of Morpheus when the gnats began their work, but by crawling entirely under the blanket and leaving just the merest hole to breathe through I could escape them. I fell fast asleep, but suddenly began to dream that I was tied to a tree and that Indians were amusing themselves by sticking spears into me. They kept coming closer and closer, and at last I awoke to find that part of the dream was true; something was sticking spears into me, but not Indians. In making the lean-to the men had interfered with the road belonging to a city of ants and they had resented it. The rest of the night was spent hunting ants, and to this day I carry the marks of that struggle.

At last the sky showed the approach of day. After a hasty breakfast of coffee and bread we started again, up hill and down, now cutting and now crawling. At noon we stopped for a hunk of bread and a smoke, and now at any moment we expected to come in sight of the Indian village. Once during the morning we had crossed an old pig trail and the track of a tapir, and stopped to listen to the call of a turkey, but so distant that we did not seek it.

At three in the afternoon we had come on a well beaten path that led to the Indian village we were looking for, where we were to make our permanent camp. The head man or chief came to meet us. After I had given him to understand that I desired to stay there and hunt, and wanted a house of some kind, he commenced to bargain. If I would give him my rifle when I left he would give me a fine house, or even the shotgun might do. I explained to him that I would very gladly do so, only I should more than likely use up all the shells, and then what use would be the gun to him? Well, then, would I give him so much money, naming enough to keep him in luxury for a year. No, I would not do that; but I offered to pay for a guide to go with me hunting, giving him and his people all the meat I shot. After much haggling this was agreed upon, with the addition of a few dollars for himself, and I was introduced to my quarters.

The Cherripos were supposed to have among them some of the best hunters in Costa Rica, and they were. But how they lived, or rather how their children lived to grow up and prolong the race, I could never see, for almost every child was a weakling, deformed from the want of proper nourishment and given to eating sand and dirt, which causes them to lose their teeth and hair, and nine times out of ten die. The greater part of the evening was spent by a large fire in front of the hut in interviewing aspirants for the position of guide.

That night I had dinner with my new friends, and when it was brought, in one big earthen dish containing some sort of stew, I did not want to ask just what it was,

for when one is hungry and far away from table appointments they do not stop to question, so with a tortilla for a plate, everybody, including the domestic animals, gathered around this family dish, scooping out their portion. At dusk everyone turned in; the family laid on mats and the writer on his blankets, and what a night! filled as the hut was, and though it was not quite as bad as the night with the ants, it would have been more conducive to a night's good sleep if the family house pig had refrained from snoring.

After donning hunting costume and taking breakfast at daybreak and stuffing a few tortillas in our pocket bag, we were ready to travel. I found the most comfortable costume for hunting in the tropics to consist of a pair of ordinary high rubber soled canvas tennis shoes, canvas leggings, and overalls, with a thin undershirt and kerchief, your ammunition in a good heavy belt thrown over one shoulder and strapped under the armpit on the other side. Matches, tobacco, and food were carried in a small bag hanging from the other shoulder. This leaves one light of foot, so that he can follow a trail all day. The advantage of the canvas shoes is that one may carry a half dozen pairs of such shoes to one pair of heavy hunting boots, and thus one can always start in the morning with dry shoes. This costume is as near a copy as a white man can come to the hunter of the tropics, who goes without shoes, but wraps his legs from the ankle to the knee in an old piece of canvas as a protection from the thorns and snakes, but leaves his feet bare.

We started out for a large swamp where peccaries had been seen a short time before. The Indian led the way, going straight through the trackless forest. After an hour we came to where footmarks were visible and wallows in all directions, but the animals had left the day before. The track where they had started off was well defined, so after them we went, up hill and down, sometimes crawling on hands and knees through a tangle of creepers, but never daring to make any noise for fear they were close at hand. Once in a while the boom of a monkey would come from somewhere away up over one's head. The monkeys are great black fellows called black howlers. Their booming can be heard a long distance. They are perfectly fearless, never moving, even after you have shot in among them.

We followed the tracks of the peccaries till noon, and then stopped to take a little refreshment, as the guide said they were traveling steadily and it might be impossible to come up to them. These animals are of two types, the smaller peccary which run in herds of not more than twenty-five are marked with a light brown stripe or collar across the shoulders, and are of uniform dark gray with heavy bristles. The larger ones are of the same color, but without the stripe or collar and with a white jaw and underpart of throat. These travel in droves of fifty to a hundred. They feed while traveling,

sometimes taking a direct path or swinging around in circles so as to keep near some favorite wallow.

After a few minutes' rest we were up and going again, this time leaving the pig track and starting to make a circuit around to the village. We had just crossed a small stream and begun to climb a hill when the guide stopped, saying, "Pigs," for he smelt them; none of us were thus educated. Then, by his instructions, we spread out and began to creep along the way the guide pointed. In a few moments all of us recognized that pigs were close by, the odor was strong, like that noticed in entering the animal house in a zoological garden. Suddenly grunts could be heard, and then we saw them wallowing in the mud. There appeared to me (who had never before seen the wild pigs) to be hundreds, but most likely there were not over fifty. I had singled out my victim and fired at the same moment that one of the negroes fired the shotgun, and the other negro the pistol. In a second the jungle was filled with the grunts and squeals of the pigs and the yells and shots of the men. It was everyone for himself, and after his trophies. The writer rushed along a hillside, hoping to cut off some of them, but failed to encounter another. The negroes could be heard away off somewhere banging away. After a while we all assembled to count the slain. One big old fellow that the good little rifle had brought down; none to the negroes, although the fellow with the shotgun swore he had naimed one so badly that he must be lying somewhere around. In a few minutes the Indian came dragging one in, shot just behind the shoulder, with the arrow almost coming out the other side. Where he got him, or how he could have been close enough to drive the arrow with all that force was a wonder.

After skinning them, leaving the heads on for mounting purposes, we started for the village, the guide leading us in a straight line directly thither. That night we stretched the skins and put the skulls in an ant-hill, that being the quickest way to clean them, and few taxidermists could have accomplished this task as speedily and as well.

The next day we were out again, but found no pigs. We ran into some monkeys called the red howler, and were lucky enough to get two, as they are very shy and travel like lightning through the treetops. That night we had monkey meat for dinner, and found it delicious.

For one month I lived among these Indians, hunting almost every day and finding them, for all their want of civilized ways, a kind and willing people. To tell of the different days and exciting times and animals shot would take up too much valuable space. At the end of the trip I had ten good large pig skins, one jaguar, and thirty-five monkey skins; also bow, arrow and spears presented to me by the people. Two days after saying good-by to the Indians and their village we were back at Las Lomas, and the next night found me in San José.

### A Man with a Gun.

I WAS standing on the railroad station waiting for the train and every one I saw was looking at me. A small boy came up to me, put himself in a spreading attitude, with both hands in his pockets fumbling his marbles, and said: "Say, mister, what are you going to shoot?"

"Nothing," I said, but he still stood around and admired the gun with now and then a question, and I stood there twirling one of the buttons on my hunting coat.

The next that came out of the crowd was the village doctor. He, too, was going on the train, but he was more interested than the small boy. He took the gun from my hands, and, with the position of a crack shot, pointed it at the fence posts, insulators on the telegraph poles and other objects. Then he asked me if the gun was loaded.

"No," I said, "I will break it and show you."

"No, no, don't break it; I believe you." But I showed him the workings of the modern fowling piece to his great satisfaction, and he said he was glad that he knew what it was to break without being broken. The doctor told me what a fine shot his brother used to be down in Virginia, but I refrained from telling him that many years ago I was captain of a raft 4x6 on a little pond in western Massachusetts.

The next one that oozed out of the crowd was a professional man from the land of the heather; polite and kind, a fine example from his native land. He started in with "Ah! my boy, out for robins this afternoon? I suppose they are quite plentiful, and it seems a shame to kill them." Then I started in and I read the riot act in a modest way and wound up with asking him if he could tell me why most foreigners thought always of killing our song birds. His answer was evasive and I know as much about it to-day as I did when I asked the question.

I told him I was going out after English snipe and he wanted to know how long since the English bird had been introduced here. Then my answer was evasive and I had to tell him they were also called Wilson's snipe. "Where do you find them, in field or fen?" "In the fields and 'fresh' meadows," I said. Then I had to explain the difference between a fresh and salt meadow.

The next to come along was a member of the National Guard, S. N. Y., from one of the crack regiments in the city. He picked up my gun, "hefted" it and said, "Light's a feather, aint it?"

I remarked it was classed in that weight. Then the train whistled coming to the station, and we all thought the same just then. \*\*\*

### A Day's Outing at Greensboro.

It was on the 21st of May that Bert and I decided to go to Greensboro. "To go to Greensboro" at that season of the year always means to go on a fishing trip to Greensboro Pond, or, to use the more pretentious name, Caspian Lake. We had been talking about going ever since opening day, but the unseasonably cold and rainy weather had not been favorable, and the reports from the lake that reached us had been rather discouraging. So we got our tackle ready and waited until the signs should be more promising.

The day before we decided to go we fell in with a man who came directly from the lake. He said they had started to bite and were biting in dead earnest; that he had caught 40 pounds the previous day in about three hours. He also told us of one Carter who had a camp on the lake for fishermen. He said Carter was the prince of good fellows and anglers; that he knew where each and every fish in the pond was at any time, and if they would not bite he simply made them bite. We listened to this report without a murmur, and concluded that Carter was just the man we had been looking for, and, as the next morning dawned warm and bright, we decided to cast our lines and fortunes with him that day.

We made good time and soon reached Morrisville and from there up the Lamoille valley through Wolcott, Hardwick and East Hardwick. The day continued pleasant and warm, the finest thus far of the spring. The road was good and our spirits were considerably higher than the schoolboys' out on a holiday. At East Hardwick we left the valley and, turning to the north, soon came to the hills we knew we must climb in order to reach the elevation of the lake. In about half an hour we were on the ridge and could look over into the basin of the pond, and presently we saw the water glisten along the eastern shore. Bert quickened the pace of the horses, and soon the whole outline of the lake was visible. The woods on the eastern slope stretched away from us in an unbroken line. At the south we saw a few houses of the little village, and on the north and west sides farms with their meadows

sloping down to the broken border of woods along the water's edge. It is a most beautiful sheet of water whose resting place is among the rock-strewn hills high above the valleys below. Its shores are lined with granite boulders and ledges. In fact, the lake itself would seem to rest in a granite basin.

Some thirty years ago, after unusually heavy rains and high water, those who lived about the south end of the lake believed that its outlet was deepening; that the water was breaking through its natural barrier and the pond would "go out." A fast horse and rider were hastened down the valley to warn the people below of the danger, and many left their homes for the high land. But the pond did not "go out," and it never will, for its outlet is over a solid granite ledge, which time itself can barely change. We delayed only a moment to enjoy the lake from its aesthetic side.

On reaching the village we learned that Carter's camp was at the extreme north end of the lake, so we urged our horses two and one-half miles further, or half way around the pond. We found the camp without difficulty, and a good one it appeared to be, nicely situated in a grove of spruces and birches, and commanding a view of nearly the whole lake. We pulled up in front of the wide porch with a loud "whoa," and a rather sanctimonious looking individual, dressed in a pair of overalls, flannel shirt and Van Dyke beard came through the trees on our left. He greeted us in a fatherly way, and on reaching us introduced himself as Mr. Carter and got into the carriage with Bert, to take the team up to a neighboring farm-house. In the meantime I busied myself putting the rods together and "stringing up." Bert soon came back alone, and I asked him what Carter said the prospect was. He answered that Carter said he guessed they were getting a few. But he seemed a little disappointed over something, and finally said Carter did not look just as he expected; that Carter appeared more like a church deacon than a fisherman; and if he wasn't a deacon he knew he must be an ex-Sunday-school superintendent, probably escaped from some picnic given on the shores of the pond. I inferred from this that such mild manners and devout appearance seemed to Bert a little inconsistent with a

character which, by sheer force of will, could compel fish to bite, and, although I remembered that the time-renowned Izaak is pictured as having similar characteristics, I was inclined to agree with him. Bert then cautioned me about my choice of adjectives when in Mr. Carter's presence, lest we offend him, and said he should try to restrain himself in case he got hold of a good fish and lost it.

After getting our tackle in readiness we went into the kitchen of the camp to interview the cook. We found him a young man industriously reading a dime novel. On asking him if the fish were biting much lately, he carelessly remarked that he got thirteen the night before after supper, fishing off the rocks just above the camp. As we did not appear to believe in so unlucky a number, he asked us to go out to the ice-house with him to look at them. We did so, and he brought forth from the sawdust a baker's dozen of nice "lakers" weighing about 2 pounds apiece. He selected two for our supper, and while they were cooking we once more arranged our tackle. Carter soon came in with his minnow trap, which had yielded plenty of bait for us, showed us how he put on a small sucker, and gave us general instructions. We hurriedly did justice to those trout as soon as ready, and taking our rods and tackle box started for the pond. Bert took the stern seat in the boat and I the bow, with Mr. Carter at the oars. Just as we were pushing off we noticed some distance out in the lake a fellow rowing by in a blue boat holding a trolling line in his teeth. At the sight of him Carter exclaimed, "There goes the pot-hunter" (market fisherman), and at once his sanctimoniousness seemed to fall from him like snow slides from a roof. Shaking his bailing dipper at the receding boat, he burst forth into a period of strenuous speech concerning "pot-hunters" as violent as it was unexpected. He unfeelingly condemned them to eternal punishment, and pictured their future abiding place more vividly than could have Dante himself. I looked over at Bert, and a relieved expression seemed to be passing over his face. He was already reaching into the bait pail for a minnow. Looking up he said, "Well, I believe we are going to get some fish"—and we did.

The lake abounds in several different kinds of fish. Lake trout, landlocked salmon, the native brook trout, locally called squaretails, and German brown trout are all frequently taken, but the "lakers" more than outnumber all the others together, and, taken from the cold, pure water of this lake, are a most excellent fish.

Mr. Carter sent the boat along with vigorous strokes and we soon threw over the anchor about 40 rods above the camp near the rocks, where the cook had his luck the night before. We sat here some fifteen or twenty minutes without getting a bite. Mr. Carter then suggested that we move up to the inlet, which we did. We had hardly gotten our anchor out here when I had a strike, and pulled into the boat a small laker of about 2 pounds weight. Bert soon had a bite, but he said he did not give the fish quite time enough, and when he got it to the top of the water lost it. I succeeded in landing another laker, the mate to my first one, and Bert had more bad luck, losing two good fish. Strangely enough Mr. Carter did not get a strike. As a lull followed in the biting and it was getting late, we decided to go in for the night. We found the camp well arranged for the night accommodation of guests, with movable partitions and as good and clean beds as one has at home.

At 3:30 the alarm clock sounded, and after a lunch of doughnuts and coffee, eaten around the kitchen stove, we put forth on the pond and through the drifting mist started for the inlet. It could not have seemed colder on a January morning, and sweaters, overcoats and gloves were greatly in demand. A half hour of sitting as still as we could in our shivering condition without result easily persuaded us to take a trip down the pond, so that we might get warm if nothing more. Each one accordingly arranged his live bait as a spinner for trolling, and let out his line. After a number of trips up and down the pond, in which we took turns at the oars, I became convinced that I had something on my line, and began to reel in. As there appeared to be no life on the end, I concluded the hook must be afloat a bunch of weeds, and Bert, who had not yet gotten a fish, said he hoped it was weeds. It proved, however, to be a small laker we had dragged around until completely drowned. As we neared the camp on the way in to breakfast Mr. Carter had a good strike and reeled in a nice laker of about 4 pounds.

As fortune had not thus far smiled on us we discussed at breakfast a change from the places we had already tried, and Mr. Carter suggested that we go out in deeper water near the center of the lake, where he knew there was a deep reef, to which we might anchor. He said he had never fished there, but had always wanted to try the place, for he believed if any fish were taken there they would be large ones. We agreed to this, and after breakfast Mr. Carter rowed us down the pond, and after some maneuvering located us over the reef. The wind was quite strong from the north, but had been blowing the past few days from the south. Bert still held down the stern seat, which was toward the north, and now certainly had his innings. We began to get fish almost at once. They seemed to be working along the reef toward the south with the wind. They would take Bert's hook first, Mr. Carter's next and mine last, and Bert got by far the greater number of strikes.

We had taken half a dozen or more good fish when Bert, after striking hard, exclaimed: "Boys, I've got a big one." He jumped to his feet, and as he started to reel up the tip of the steel rod shot into the water with a snap. For fully a minute the fish sulked on the bottom. Then Bert began slowly to reel up, playing it from time to time. He carefully led it up to the side of the boat, when Mr. Carter, getting his fingers in its gills, for he will not use a gaff, lifted it in. It was a handsome laker, and weighed a little over 6 pounds. Soon after this, while drawing up my line, I saw in the clear water following up the bait a fish which, somehow from its size and movements, reminded me of an approaching freight train. I quickly let out my line again, and was rejoiced to see it move off at a good pace. It went out about 100 feet, when the fish stopped to swallow the bait. I gave it plenty of time and then struck. It made a rush directly toward the boat, and in my haste to keep the line tight it got over the handle of the reel; so I dropped the pole and pulled in hand over hand for dear life. The fish came up close to the side of the boat, popped from the water like a cork from a bottle, and by its own momentum fairly landed itself in the boat. For fear it would continue its flight upward I hurriedly struck it on the head. We could not determine whether this fish intended to put up a hand to hand fight, or whether it was a case of suicide. It was a long-bodied laker and tipped the scales at just 8 pounds.

About 11 o'clock the biting stopped, and we decided to go in for dinner. Just as we were sitting down to the table we heard, out by the pier, a great shouting among some boys who were staying at the camp. Mr. Carter ran out and we followed him. One of the boys appeared to be flat down on his stomach near the end of the floating pier, which was covered with two or three inches of water. Mr. Carter carefully reached under the boy and pulled out a fish of surprising size, a German brown trout which weighed 8½ pounds. The boy said he was casting off the end of the pier in about 2 feet of water, for fun, when this fish seized his bait. He led it into the shallow water which covered the pier, when the hook pulled out. The boy was game, however, and threw himself flat down on the fish and held it until Mr. Carter came to the rescue. Mr. Carter said he was sure he had seen this same fish a number of times about the pier, where probably it came to get the dead minnows thrown out of his bait pail.

We finished our dinner without any more excitement, and as the wind had gone down Bert and Mr. Carter decided to try deep trolling for a time, while I, with a boy to row me, started for the salmon ground, for I was very anxious to get a salmon or two, though it was rather early in the season for them. I put out a Bacon spinner on 100 yards of line, and the first time over felt a vigorous pull. Instantly a succession of leaps from the water showed me that I had the much desired prize. True to its race and traditions, it was a brave little fighter, but it was hooked securely and was soon

lifted into the boat. My pocket scales gave its weight as 3 pounds—not much of a salmon, to be sure, but large enough to give the thrill which no other fish can. We turned the boat and went back over our course. As the spinner reached what seemed the very same place there was another strike, followed by the characteristic leaps, and I soon had another salmon in the boat, though a little smaller than the first. After this we trolled over the same ground a number of times, but without success, so decided to join Mr. Carter and Bert. We found they had had no luck with the deep water troll, and were pulling for our old stand over the reef. We followed, and both boats were anchored as near as possible to our position of the forenoon. We waited patiently a couple of hours without a strike, and then, getting uneasy, began to move about. During the afternoon we got three rather small lakers, and at about 5 o'clock decided to "call it quits," as we wished to get an early start on our drive home. The cook was faithful to his instructions, and we found our early supper waiting for us. While we were eating he got our fish from the ice-house, washed them and laid them out on a piece of sacking before doing them up. Though we had no very large ones, to our eyes they were a handsome sight—nineteen lakers and two salmon, which we estimated to weigh at least 50 pounds. About half past six we left the camp, giving Mr. Carter most sincere assurances that we would come again. We felt, as the boys say, that we had been used white, and that we could not recommend Carter's camp too strongly to our friends. We saw enough of him to know that he cannot do enough for his patrons. He furnishes everything—entertainment, boats, bait and even tackle if one needs it at the very low rate of \$1.50 per day. He is willing to get up morning after morning at 3 o'clock, and will row the boat from sunrise to sunset. His patience seems never to be exhausted, and he is always as smooth and even as the lake can be on a mid-summer eve, unless, as I have intimated, the "pot-hunter" invades his territory. He is, in short, a true son of the old Izaak.

We reached home a little before 11 o'clock, tired, but well pleased with our entire trip. In the morning our fish lay in state for a short time in the hotel office, where they were admired by the fraternity.

I have above described Caspian Lake as a beautiful sheet of water. It is to me an unusually attractive place, and as evidence that it has been always admired and appreciated I find on one of the earliest maps its name given as "Beautiful Lake." The sportsman who goes there for a day's fishing, however small his catch, will not consider his time wasted or his trip a failure, and if he comes as a summer vacationist with his family he will find beside this pearl in the hills a most delightful community, made up of the cottagers and campers. The fishing is always good enough to be interesting, and if one tires of holding the rod or troll line he can swing the golf stick instead. Whatever one may do there his spirits cannot fail to respond to those surroundings and his physical nature to the always cool and health-giving atmosphere. By day the laugh of the loon comes to one from over the water, and at night the old owl will awaken the echoes from the eastern hillside, always to be answered by the scarcely distinguishable hoots of fishermen and boatmen on the lake.

HYDE PARK, VT.

NUNC PRO TUNC.

## Fish and Fishing.

### Where to Get the Early Trout.

I AM frequently importuned by letter and interviewed in Quebec by visiting anglers or by those who are on the lookout for a trip to the northern woods, as to the most favorable localities where open spring trout fishing is to be found. The opening of the trout season is fixed by the laws of the Dominion of Canada for the 1st of May, and in some seasons I have had fly-fishing on that day in Lake Beauport and other waters in about the latitude of Quebec, which is the same as that of the northern part of Maine. There is reason to believe, however, that this year the ice will not leave Lake Beauport before the 8th or 10th of May, and it will be some days later before the fishing is good. This fishing is open, as also is that in Lake St. Charles. Both lakes are about fourteen miles from Quebec, and must be reached over country roads, which, though rather hilly, are otherwise in fair condition. The fish are not large, nor yet particularly plentiful, but what the proficient angler will like about them is that they are educated and shy and not to be taken in the crude manner that suffices for the unsophisticated fish of more northern waters. Larger fish are to be taken as early as those of Lakes Beauport and St. Charles, in Lake St. Joseph, which is reached by rail from Quebec at a distance of twenty-four miles from the city. Some of these trout run to two and three pounds weight apiece, though the majority are smaller. The best fishing for trout in this lake is had within the first few days after the disappearance of the ice, though later in the season there is also fair bass fishing to be had in another part of the lake, which is some ten miles in length, and extremely picturesque.

Judging from letters which have passed through my hands, there appears to be an erroneous impression abroad to the effect that almost the entire fishing and hunting territory north of Quebec is in private hands or leased to clubs, and that very little is available to the general public. This is a mistake. In the vicinity of Riviere-a-Pierre, fifty-eight miles from Quebec, on the line of the Quebec and Lake St. John Railway, in the neighborhood of Mequik, a few miles further on, and along the upper waters of the Batiscan River which hugs the line of the railway for so many miles, there are many free waters in which excellent trout fishing is to be found.

Nor must Lake Edward be forgotten in this connection. The reputation of this lake and the size of its trout rival those of the far-famed Nepigon, and the fishing is virtually free, being at the disposal of the only hostelry at which visitors can stop there, or which can furnish camps, and leased to it by the government in order that some of the best fishing in the country should be available to the

general angling community which has no claim upon any other specially preserved Canadian waters.

Under the same control are a number of other lakes reached by easy portages and canoe routes and also some good river fishing. Present prospects are that this fishing should be good this year by the third week of May. The railway people tell me that many members of different clubs along the line of their road intend going to their preserves about the middle of the month. I doubt if they will find the fly-fishing good before about the 20th or 24th of May.

### Nepigon Trout.

It is gratifying to learn from the report of Overseer McKirdy, now in my hands, that the fishing on the Nepigon River last year was fully up to the average, both in size and quantity. The river was well patrolled, and two new camping places opened to relieve the August congestion. A beneficial result is expected to follow the extensive work which has been done in the way of clearing the river of pike and suckers. Thousands of these pests were destroyed last year, and still more radical measures are suggested. While much may be done toward reducing the number of the spawn destroyers and devourers of young trout in the river itself, I believe it will be found necessary also to undertake the work on a very large scale in Lake Nepigon, whence they constantly descend into the stream.

Mr. McKirdy furnishes a very interesting contribution to the discussion, always to the fore, of the relative merits of fly and bait-fishing. Many of the leading sportsmen who visit the Nepigon have long expressed the very reasonable desire that only fly-fishing should be permitted in so magnificent a river. On the other hand, there are bait fishermen who cry out that the larger fish will not take the fly, and that if they had to depend upon fly-fishing for their catch it would contain only small fish. In order to sustain his contention that an expert fly-fisherman can take just as good fish in the Nepigon as the bait-fisherman, Mr. McKirdy quotes the record for last season in the river of Mr. Henry Bristol, of New York, who caught with the fly one fish of 7 pounds, one of 7¼, one of 6¼, three of 6 pounds each, two of 5½ and two of 5¼.

Surely, as he says, fishing such as this should be good enough to satisfy anybody! E. T. D. CHAMBERS.

## Bass Casting in Nebraska.

REGARDLESS of what the weather may be just now, the ideal season for outing and angling is coming on apace. By the time another month rolls by many Omaha sportsmen will be wading the mountain streams for trout or specking the blue waters of the Minnesota lakes with their minnows and frogs for bass. Of course, there are many ardent followers of old Izaak who have neither the time nor the money for extended pleasure trips, and this class must content themselves with frequent short trips to nearby waters, down on the Nisthna, up at Ericson, over at Manawa and out at Cut-off, for their excitement with the wary and gamy bass, waiting for the blessed vacation days before venturing up to Lake Washington and the northern lakes.

Just now I wish to chat upon the modern modes of fishing, bait and fly casting for black bass, the king, I think, of all game fish, and certainly the species we oftenest pursue and know the most about out here. The feeding grounds of the big mouth are commonly found among the moss beds, the splatter-dock and shallow weedy places along the shores of our tule-bordered lakes, while his more symmetrical and graceful cousin, the small-mouth, haunts the deep holes, under shelving rocks, around old stumps and half-whelped logs, where there is shade and cold water all through the summer days. They are also to be found largely in the Missouri, Niobrara, Birdwood and Loup, where they thrive better than their cavern-mouthed congeners, and always give you a better fight. Well, I will not say that either, for I have always found the Lake Washington big-mouth about as rangtankerous a fellow to handle, when once the barb has stricken deep, as is his slenderer relation. Many authorities, however, give unqualifiedly the preference to the latter, and such men as Myron Learned, George Entreken or Dr. Sherraden would rather hook one small-mouth than a half dozen of the big fellows. In the streams the small-mouths frequent much, the swiftest rapids, or the swirling pools formed invariably below abrupt turns in such streams as the Niobrara, and it is the handling of them in such waters that makes the fight seem the harder and more exciting.

In fishing on the lakes it is almost imperative that you use a boat, as the shores are generally of such a character as to preclude wading. But along the streams it is different, excepting the old Missouri, where, owing to the roily nature of the water, bassing is seldom attempted. But along all the lesser rivulets wading is always practical, and even were it not, the likely spots can almost always be reached by even an indifferent caster. In casting from a boat the one mode at Lake Washington, while the fish are on their feeding grounds, and where they are to be almost wholly found through the early summer days, you must use the utmost caution. Old Micropterus is vigilant, and once frighten him by undue floundering about in your boat, as you make ready for active operations, or loud talking, and you might as well move on to some other likely spot. When once within reach of a seductive looking cove or hole in moss, lily pads, or adjacent to sunken treetop, you must make your cast as quietly and as delicately as possible, to avoid alarming the wary fish lying in wait for his morning or evening meal.

A black bass is one of the most alert of all our game fishes. He is suspicious, contrary and sullen, always on the qui vive for trouble, and consequently getting his full share of it, but sees more valor in running away from mysterious sounds and sights than he does in remaining to give battle or investigation. Corner him and he will fight like a rat. But he is one of the most difficult of fish to fool.

The late Judge Charlie Ogden was a skillful caster and a most successful angler, and many's the time I

have sat idly in the bow of the boat, with Pat Sheehan at the oars, and contented myself with watching him as the boat backed imperceptibly, almost, to within reach of some bass's lair.

The Judge's skill, which would usually cause the old bass to make the mistake of his life, was something entrancing to behold.

Should the lure alight without tempting the bass from his hiding place and you have not been greeted by that electrifying splash and swirl, you may yet induce him to dart forth from moss or weedy perdu by carefully retrieving your line and slowly trolling through the little pool into which you have made the cast. Thus you cover a larger water surface than by casting and recasting, but you must understand the business, and here is where the Judge's skill was so superior. It mattered not to him whether he was using a Homan weedless or plain Skinner spoon, he easily and gracefully manipulated it through the tangle, almost as the ordinary fisherman would reel in through clear and unobstructed water.

But casting in the shallows is not always the thing, and when you score a failure here you must resort to deep water. Even the big-mouth, especially when a thunder storm is imminent, frequent the depths most of the time, and it is sometimes absolutely impossible to induce them to rise. In such a case you must humor him, another thing I learned from the Judge, and sink your lure to the depth they haunt. This, however, is more frequently the case with the small-mouth, who undoubtedly have a greater fondness for deep water than their clumsier relation.

I recall a personal experience when floating down the Minnesota River, two years ago, with George Scribner. At a point off from St. Peter we came to a deep hole in the river beneath a tangle of fallen timber lodged on a shelving ridge overhanging the water at a sharp bend. Noticing that it was an enticing spot we pulled above it, secured our craft to a protruding snag, stood up and cast our spoons out and under the overhanging mass as far back on the surface of the hole as possible, allowing them to sink several feet, then trolling them back carefully and slowly. The result was that we brought to basket thirty-nine small-mouth black bass in less than sixty minutes, each of us using a seven-ounce casting rod, a forty-five yard quadruple reel and an H size silk line. The average weight of these fish was one and a half pounds.

I might add here that I have caught all kinds of game fish, from maskinongé to trout, but bait-casting for bass is the most exciting and interesting of all. Drifting over Washington or Jefferson's rippling surface these exquisite days and taking these splendid fish with light rod and delicate bait-casting outfits is an experience fit for the gods.

A proficiency in this gentle art makes it easy for the sportsman to improvise many lures. There are scores of devices in the way of spoons and artificial baits on the market to-day that are in every way almost as killing and attractive as the live frog or minnow. This alone is sufficient to make the sport popular over that of any other species of fishing, for in the absence of available live bait you have your flies and leaders and can proceed to enjoy yourself without wasting hours in chasing frogs or hunting for grasshoppers or crawfish. But, so far as I am concerned, individually, this hunting and catching frogs is a very necessary part of the fun, but little behind the real thrill of catching the fish. If you simply have to touch the button the sport is immeasurably decreased, as all good old anglers I know will agree with me.

SANDY GRISWOLD.

OMAHA, Neb.

## Spring Sea Angling in California.

AVALON, Cal., April 20.—Never in the history of the "oldest inhabitant" has there been such good fishing all winter as during the past season. Yellowtails have been taken in Avalon Bay, Santa Catalina, all winter long. Sea bass were taken a month ago and tourists have been correspondingly delighted. The latter are often disappointed in the fishing here—supposing that tuna can be had at any time—but it should be remembered there are fishing seasons everywhere, and even in southern Florida and at Aransas Pass tarpon are conspicuous by their absence in the "winter months." The seasons of Santa Catalina fishes may be given as follows, always remembering that some years the season is early and in others it is late: Sheepshead, whitefish, albacore, rock bass (four or five kinds), blue perch, groupers, are taken every month in the year. The leaping tuna comes in May and lasts until August; yellowtail comes in March, giving a season of eight months. White sea bass arrive generally in May or April, and are caught off and on all summer. Black sea bass, April to December; sometimes all the year. Swordfish, barracouda, bonito and others, April to December. Then there are a lot of small fishes caught at all times. It is difficult for the average eastern angler to understand why the tuna is only caught at Santa Catalina and confined to about four miles of the coast there.

This is due to the character of the California coast. None of the above-mentioned fishes are taken (with rare exceptions) from the beach of the mainland. The tuna never comes in within ten miles of shore, and all the large fishes that are said to be caught at San Pedro, Long Beach, Santa Catalina, Ocean Park, Redondo and other ports on the main land are taken out to sea from two to five or more miles on sunken banks.

The coast of Southern California is a stretch of sandy beaches upon which the surf piles in before the trade wind and affords no protection to the big game fishes, hence the principal catch of the wharf angler in the mainland is the croaker—five or six pounds—redfin, halibut, surf—five or six pounds—and other small fishes, which can be lifted on to the high docks with stiff bamboo poles. Occasionally a yellowtail is taken, or a sea bass, but as the fish have to be towed up through the surf there is not much satisfaction in it, and the main land sport is confined to the small game described. At all these places professional fishermen are found who take passengers off to the banks from one to five miles out in the Santa Catalina channel, where fishing is to

be had in deep water, but to obtain trolling with light rods and smooth water we must go to the islands off there, where, at San Clemente, there is twenty miles of lee, and at Santa Catalina about twenty-two miles of smooth water, often like glass. It is this peculiar condition—smooth bays, twenty miles off shore, protected from wind and sea—that has made the fishing famous from the light rod angler's standpoint. The bays of San Clemente and Santa Catalina are the spawning grounds for all the great game fishes and for the bait fishes, sardines, anchovies, smelt and flying fishes, and as a result splendid fishing is to be had not one hundred feet from the picturesque rocky shores of these islands. Avalon, the town of Santa Catalina, is an interesting example of a growth the direct result of the demands of anglers, who come here at a rate of three hundred a day all winter, and a thousand a day in summer, giving the little town a summer population of eight or ten thousand, many of whom "go a fishing."

In the winter there is one large boat from San Pedro to Avalon daily, making the run in two and a half hours. In the summer there are three steamers a day. There are hotels, cottages, boarding houses, tent cities, and every possible requirement for the angler. He can pay twenty dollars a day and have all the comforts of city life, or he can camp out for almost nothing—and to make camping and tent life popular, there are several stores which make a business of providing ready cooked meals, so that the angler in a tent can live well at the least expense.

Perhaps the most remarkable feature of this angler's city is the equipment of the boatman or gaffers. It has been estimated that they have a fleet and outfit valued at \$150,000. Each boatman has a stand, and is given almost twenty feet of beach room on the south side of Avalon Bay, a stone's throw from the landing. There is the "stand," a seat facing the bay, on which the angler sits when making his arrangements. On the upper portion is the boatman's name, and near by his rods, reels, his line dryers, his scales for weighing fish, and extending out from the island is his string of boats, to which he calls attention with no little pride. There are possibly six or eight rowboats, for the use of anglers who wish to row or fish about the bay; then two or three launches and sailboats. The launches are about eighteen feet in length, having a six or eight horse power engine. In the stern, facing it, are two comfortable chairs without legs, in which the angler sits when trolling. The boatman is engineer and gaffer, and serves his patrons with the best rods, reels and lines that can be bought in the East. The boat is broad of beam, comfortable and safe, and when it is said that there are from seventy-five to one hundred of these tuna boats out every day, and scores of small boats, some idea of the angling that is done in and about Avalon may be imagined. The writer has visited almost every fishing resort in the country and nowhere is there so splendid an equipment for the use of the angler. I refer to salt water angling, and it would be a good plan for some of the boatmen of Florida and Texas and the Louisiana passes to take a run out to Santa Catalina, and take the hint, and give their patrons better equipment.

The boatmen or gaffers of Avalon number perhaps one hundred. They have an organization, the object of which is to give their patrons all the comforts possible. They have a club house, a fund for which was given by Mr. Tutt, of Colorado Springs, as a memorial to his daughter, who died here, and the club is called the Sophia Boatmen's Club. Here the men have a regular club house, billiard table and library.

When Miss Tutt died there was unusual mourning among the boatmen, who were devotedly attached to the young girl. When the steamer left with her body a memorable and a pathetic scene was enacted. Following the steamer came her own boat with flag at half mast, the seat empty and decorated with flowers, and behind came every boatman's launch of Avalon, with flags at half mast, forming a funeral procession over a mile long, that escorted the leaving steamer far out into the channel, a last token of respect to the young girl, and one unique—at least in these waters.

The spring fishing at the islands has been unusually good. This week a school of yellowtails rushed into Avalon Bay, and everyone in town was seized with the fever. The big fishes dashed in upon the beach, sending the small fishes out upon the sands, and over one hundred men, women and children were seen fishing and wildly excited. They averaged from five to seven fishes apiece.

The game fishes of Santa Catalina will be exhibited at the St. Louis Exposition, a specimen of each having been mounted for the purpose. With these will be shown the tackle used in taking them, a series of the non-game fishes and a set of paintings of the same from life by Miss Lauterbach, a local artist.

One of the most interesting angling pieces of news in this section is that the striped bass, introduced into the waters of San Francisco about six years ago, has reached the waters of the Santa Catalina channel, several large specimens having been taken. These fishes swam five hundred miles down the coast, and will prove a welcome addition to the angler's bag.

A new sport here is taking the swordfish with the rod, several eight or nine feet fish having been landed, and it can be said that no better game fish was ever hooked than this long, graceful swordsman of the sea. Besides the splendid play there is always the delightful possibility of the mad creature charging the boat and sinking you, after the fashion of the sloop "Red Hot" of New Bedford, that was sent to the bottom by an ugly swordfish that had been harpooned. The strenuous school of anglers who want an element of danger in their sport will find this sport just to their liking.

SENIOR X.

THE giraffe is "a beastie full of spots. He hath two little horns growing on his head the colour of iron, his eyes rolling and growing, his mouth but small like a hart's, his tongue is neare three foot long. The pace of this beastie differeth from all other in the world, for he doth not move his right and left foote one after another, but both together, and so likewise the other, whereby his whole body is removed at every step or straine."—Four Footed Beastes, 1607.

## A Weekly Dog Story.

### I.—A California Dog Painter.

"YES, sir. For instance, there's a mammoth winter storm landscape I've just finished for Mr. Mudd, the Bonanza king. It's called 'A Hailstorm in the Adirondacks,' and a visitor who sat down near it the other day caught a sore throat in less than fifteen minutes. The illusion is so perfect, you understand. Why, I had to put in the finishing touches with my ulster and Arctic overshoes on."

"Don't say?"

"Fact, sir; and then there's a little animal gem I did for Governor Glerkins the other day—portrait of his Scotch terrier Snap. The morning it was done a cat got into the studio, and the minute it saw the picture it went through the window like a ten-inch shell."

"Did, eh?"

"Yes; and the oddest thing about it was that when I next looked at the canvas the dog's hair was standing up all along his back, like a porcupine. Now, how do you account for that?"

"Dunno."

"It just beats me. When the Governor examined the work he insisted on my painting in a post with the dog chained to it. Said he didn't know what might happen."—San Francisco Post.

### The Traveler and the Native.

THE traveler stepped out of the car to stretch his legs a bit while the trainmen were doctoring a hot box.

"What town is this?" he said to the solitary native on the station platform.

"Name's on the sign up there," replied the native.

"Oh, yes—Dearyhurst. How far is it to Chicago?"

"You'll find that on the sign, too."

"So it is—fourteen miles. Much business done here?"

"Not much. Keeps us pretty busy, though, mindin' it."

"Had a great deal of rain in this section?"

"Well, we ain't growed webs on our feet yet."

"Any newspaper published in the town?"

"No, sir. Nothin' but the Dearyhurst Democrat."

"Much building going on here?"

"Some. Abe Syfert put up a chicken house last fall."

"You don't have much business to do yourself, do you?"

"Yes, sir. They keep me down here at the deepo to answer fool questions."

"So I perceive. Well, my friend, you're rather too many for me. Do you ever take a drink?"

"Sometimes."

"Then suppose you go to the pump there and help yourself. I see the train is moving off. Good-by."

Chicago Tribune.

### Increase in Bird Life.

LITTLE ROCK, Ark., April 25.—Editor Forest and Stream: I have been in the country somewhat this spring, and I think I can see the law prohibiting the sale of game has already borne good fruit. I saw a large number of quail, and the prospects seem fair for a large increase in that game. I also heard of turkeys and deer, but saw none.

I was struck with the great increase in the number of birds in the last three years. Since the women quit wearing them so much the supply has greatly increased in this country. The bluebirds were almost extinct, but now are getting to be fairly plentiful. The redbirds are getting numerous again, as I often saw them in flocks of five or six. The mockingbird is hardly holding his own in spite of the law, as the negroes will rob the nests, to sell the young ones. They always build around a house, and unless the owners protect them they have a bad show.

Still, the increase of bird life is very marked, and a few more years of protection and education will bring them back to their old-time plenty.

## That Mississaga Canoe Trip.

BY L. O. ARMSTRONG, MONTREAL, CANADA.

"Too much load," said Alec Langevin, the guide, who had been recommended to us by the Hudson's Bay Co. agent at "Bisco," as we were repacking our outfit for the trip down the Mississaga River.

It was in August of the past summer and the start was made from Biscotasing station. This station is on the height of land from which the waters run both ways; some of the many lakes and rivers emptying in Hudson's Bay and some into the Great Lakes. Biscotasing Lake, upon which we first embarked, is one of the sources of the Spanish River, which empties into Lake Huron, north of Manitoulin Island, and the next lake is Ramsey, connected with Biscotasing by a few hundred yards of rapid water, and rough. We followed these mother lakes until, by a short portage or carry, we reached the head waters of the Mississauga River, one of the largest rivers in Ontario, which we followed to Lake Huron, reaching it at a point about equally distant from Chicago and Detroit, and about sixty miles east of Sault Ste. Marie, Mich.

The Mississauga has given its name to one of the tribal divisions of the Ojibway nation; it means the river of the big wood.

Our party was experienced in canoe trips. On the maiden trip we would recommend to others that they should pitch their tents, make their beds and cook a meal at the starting point before taking to the canoes, as it is the most effective way of ascertaining whether errors or omissions have been made in outfitting. The Hudson Bay Co.'s store and another, Shannon & Booth's, enable one to correct these faults of omission.

Mr. Shannon, of Shannon & Booth, general merchants at Bisco, arranged to team our duffle to his large gasoline launch in a lumber wagon, and afforded us a ten-mile lift in the launch across the lake. We had our first meal at his floating lumber camp at the southern end of Bisco Lake, and a capital dinner it was.

The men of the camp had as a pet a swallow, which had hatched its young just over the dinner table on a beam. This little incident prejudiced me in favor of these gentle lumbermen. In fact, in this lumber camp it is "like master, like man," and the standard is high.

There is another and a much shorter route starting from Winnebago siding instead of Bisco. It is about forty miles west of Bisco. One of the Indians called our way of going a "merry go round trip." This Indian wit had traveled with the "Hiawatha Drama Co." and knew what a merry go round was. Some friends of mine took the trip via Winnebago siding, and their report has rather converted me to the Winnebago way. In fact, I shall take the Mississaga trip next year again, and will go via Winnebago myself.

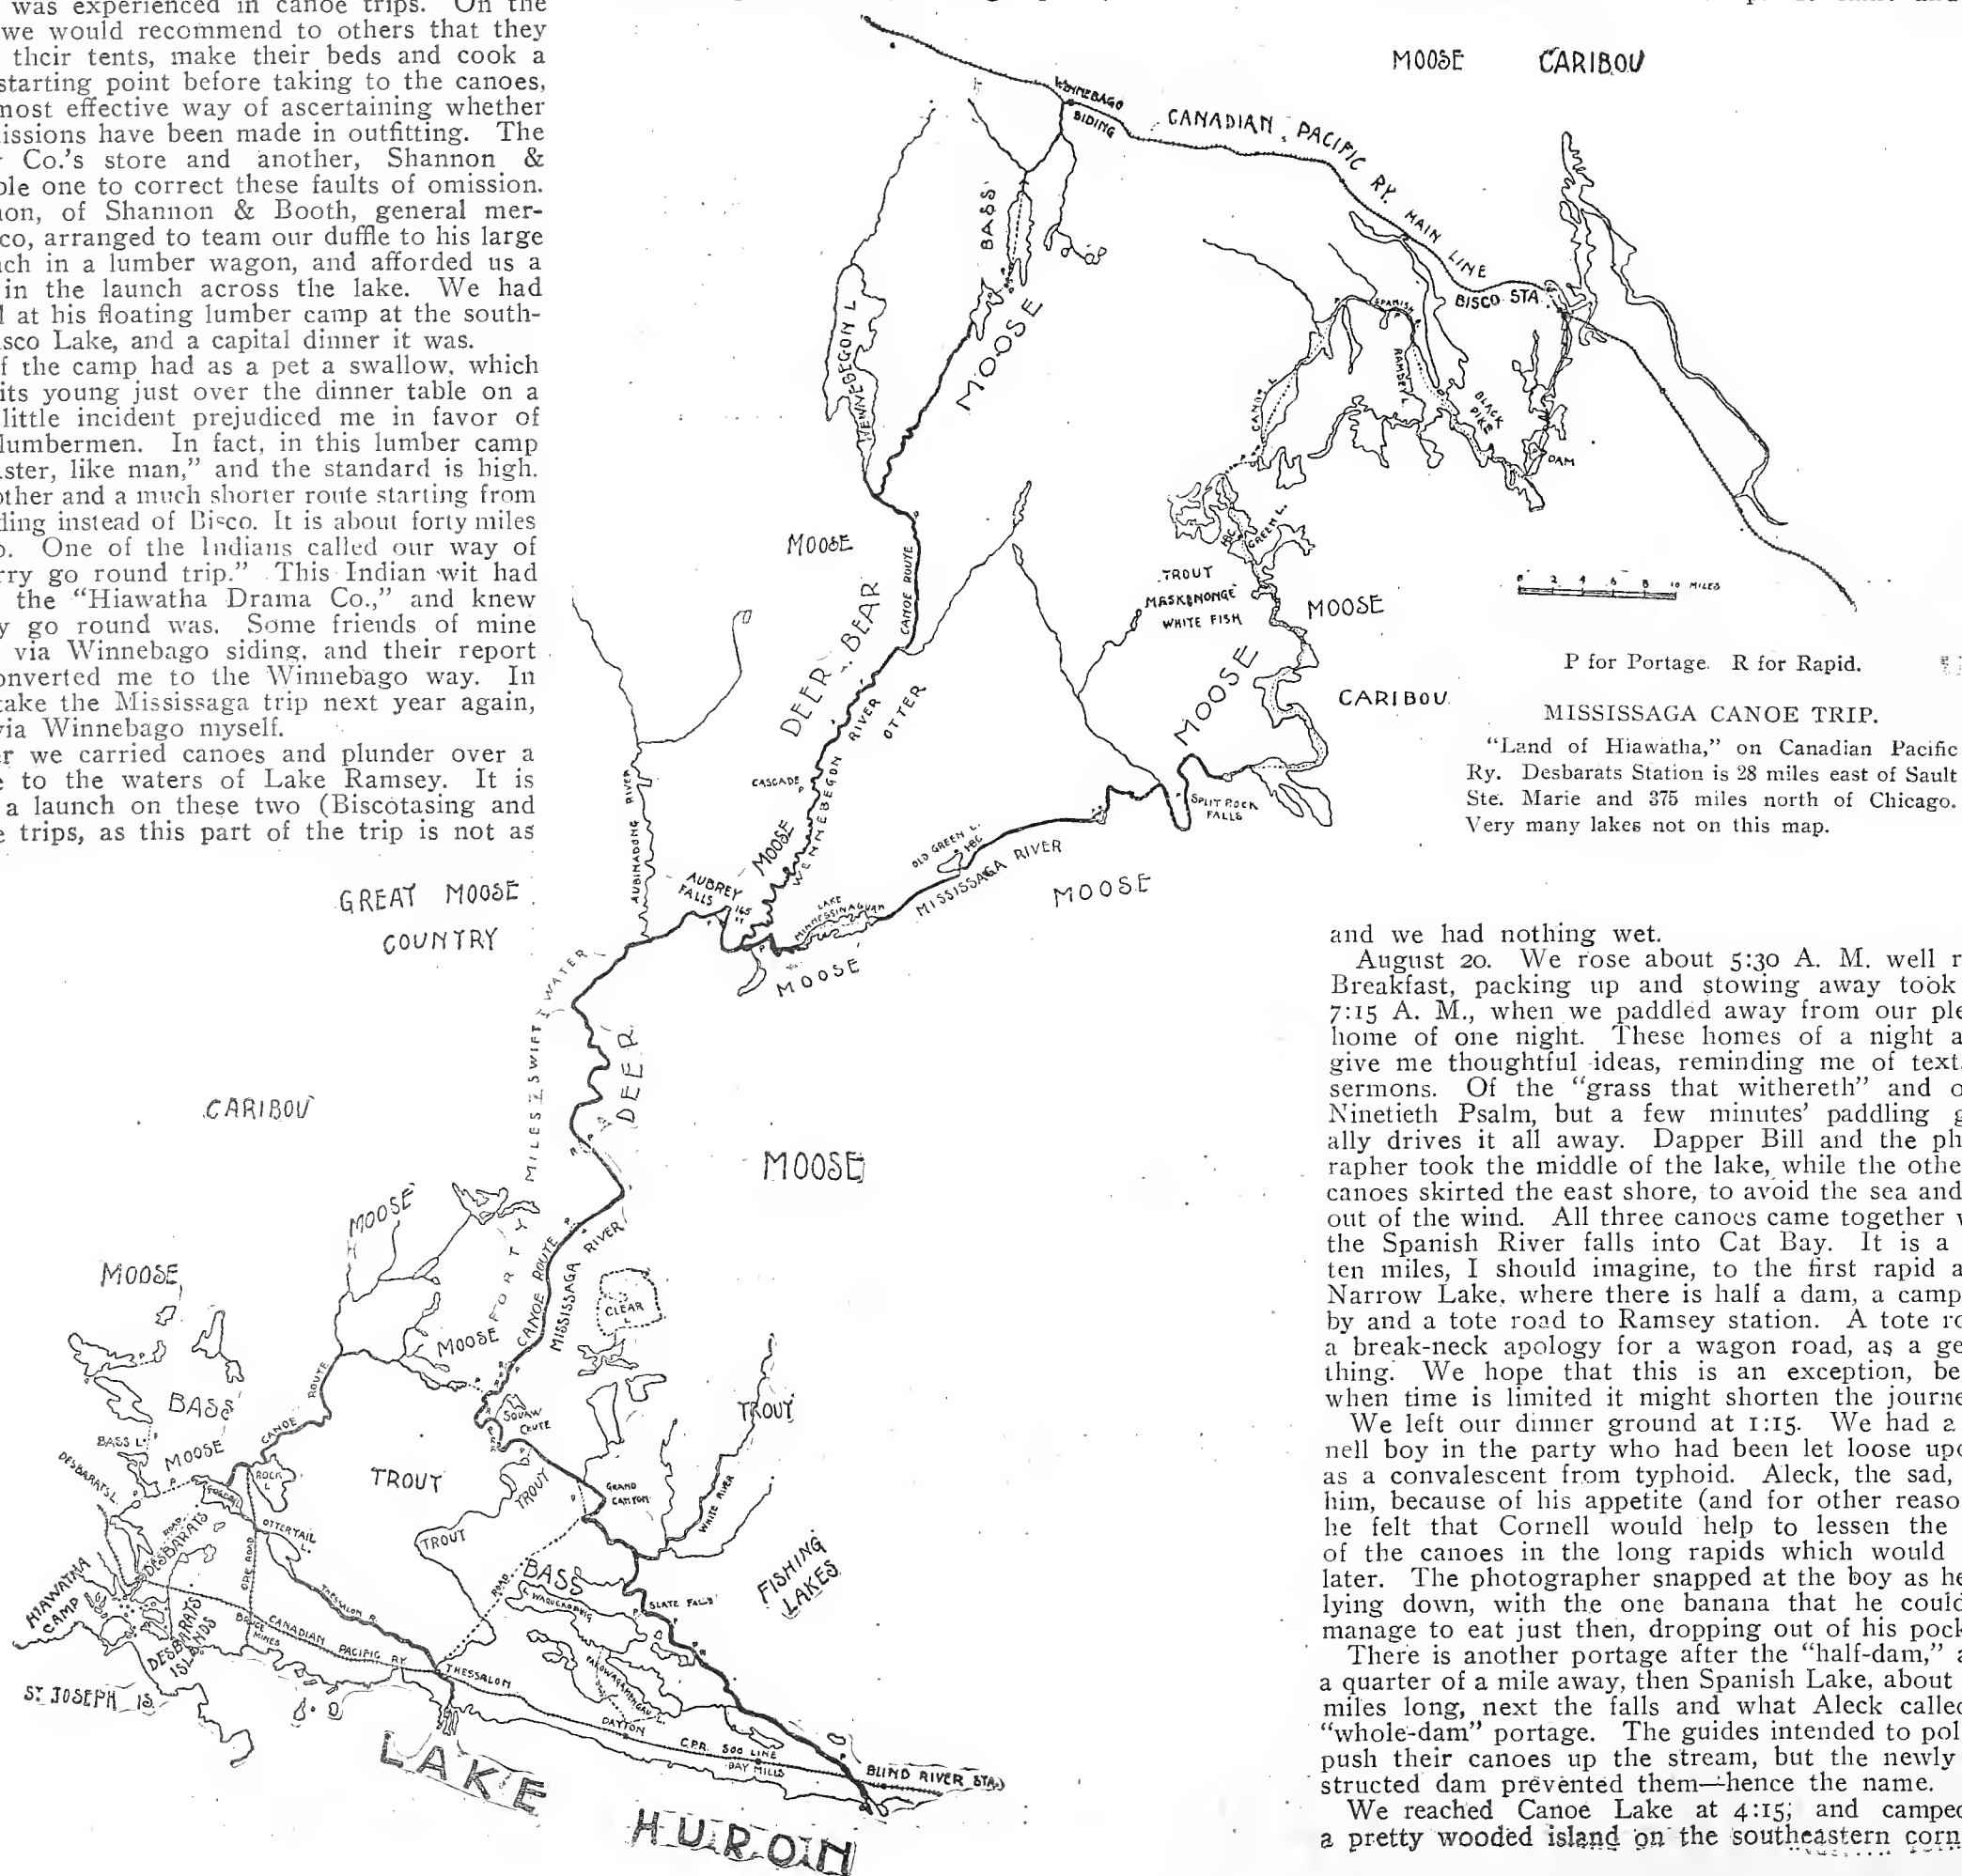

After dinner we carried canoes and plunder over a good portage to the waters of Lake Ramsey. It is wise to take a launch on these two (Biscotasing and Ramsey) lake trips, as this part of the trip is not as

interesting as the rest. The launch may be arranged for at Biscataasing. We caught only pike (although uncommonly gamy pike and firm of flesh when cooked), and we had seen just as pretty lakes in Maine and elsewhere in Canada. We would have been a little disappointed had not George Linklater told us many interesting things about the Ojibway Indians of these parts, of which some are Christians and some are pagans. As usual, the pagans are the more honest. They will not accept any treaty money or provisions from the Government, and will not live in any village where there are white men, because of danger of contamination. They have left their hunting grounds and are making canoes for tourists and railway and Government surveyors. I like their canoes and moccasins for snowshoeing better than any other. They are gathered and pointed, and this, I am told, has something to do with their tribal name of Ojibway. Aleck Langevin, our half-breed, is a good guide, but a more taciturn, uncommunicative man I have never met. He never complained of being worked hard or of the weight of his canoe (although he was worked hard), but he did let us know unmistakably that he was tired of being asked questions and of being forced to talk to answer them.

We came south about a mile and a half from our dinner camp, and there, turning a point, took a north-

westerly course. After paddling about six miles we camped on a long, wooded point. Ramsey Point, near Cat Bay, a capital camping ground. We had a good lot of men, but as all had to paddle and three of us were tender at the work, 5 o'clock saw the tents up, and the writer volunteered to help the cook by cleaning some of the fish that we had caught. Its back was jet black, its flesh was pink and firm and flavor extra good. Our larder was well filled. Our Montreal grocer had made a mistake and had sent us in addition to our order a liberal supply of vegetables and fruit. Aleck, ever sad and sober, was moaning over our too much loaded canoes, but when he saw how much our seven eating machines could consume in one meal he grew a little more reconciled to the situation. Haricot soup, bacon and pike on a plank, with boiled beets, marmalade, green gage plums, biscuits, tea and coffee was a first-class meal, good in all its parts, and it was not the unhappy transition from dining car to camp that it sometimes is to gastronomers. We agree with Aleck, however, and advise other people so to load their canoes that they will on the fourth day out draw no more than six inches of water. We had three good guides; Geo. Linklater, dapper Bill Harris and Aleck Langevin.

We camped betimes, because, about 6:30 P. M. a smart summer shower came up. It came and went.

"Land of Hiawatha," on Canadian Pacific Ry. Desbarats Station is 28 miles east of Sault Ste. Marie and 375 miles north of Chicago. Very many lakes not on this map.

and we had nothing wet.

August 20. We rose about 5:30 A. M. well rested. Breakfast, packing up and stowing away took until 7:15 A. M., when we paddled away from our pleasant home of one night. These homes of a night always give me thoughtful ideas, reminding me of texts and sermons. Of the "grass that withereth" and of the Ninetieth Psalm, but a few minutes' paddling generally drives it all away. Dapper Bill and the photographer took the middle of the lake, while the other two canoes skirted the east shore, to avoid the sea and keep out of the wind. All three canoes came together where the Spanish River falls into Cat Bay. It is a good ten miles, I should imagine, to the first rapid across Narrow Lake, where there is half a dam, a camp near by and a tote road to Ramsey station. A tote road is a break-neck apology for a wagon road, as a general thing. We hope that this is an exception, because when time is limited it might shorten the journey.

We left our dinner ground at 1:15. We had 2 Cornell boy in the party who had been let loose upon us as a convalescent from typhoid. Aleck, the sad, liked him, because of his appetite (and for other reasons)—he felt that Cornell would help to lessen the draft of the canoes in the long rapids which would come later. The photographer snapped at the boy as he was lying down, with the one banana that he could not manage to eat just then, dropping out of his pocket.

There is another portage after the "half-dam," about a quarter of a mile away, then Spanish Lake, about three miles long, next the falls and what Aleck called the "whole-dam" portage. The guides intended to pole and push their canoes up the stream, but the newly constructed dam prevented them—hence the name.

We reached Canoe Lake at 4:15; and camped on a pretty wooded island on the southeastern corner at

5:30 P. M., and we were sorry indeed that we had done so next morning, because a very high wind made us prisoners on the island until 3:30 P. M.

Aug. 21. Aleck, the sober and sad, is developing. We had no regular cook, and made each guide take his day. "The silent, smoky Indian" part of Aleck looked on at the various attempts at cooking for two days without saying a word, until a reward was offered of a kind that both half-breed and Indian find it hard to resist. This he could not resist. "Me try make bread," he said, and he made white bread and corn bread so well that ever after the others awarded him the prize without a contest. On the first attempt I read to him from the admirable little publication supplied by the R. R. Co. gratis, "Hints on Camping," "three parts of corn meal, one pint," etc., but he did not listen long before putting his hands to his ears and saying, "me do it alone, not know that way," and he did it alone. He opened a bag of flour and mixed up in the bag a quantity of flour the size and shape of a large coconut, with hot bacon fat as a mixer, then added corn meal. The bag was his only bread pan. A very little sugar and baking powder was added, and then he kneaded the whole for one minute inside the bag. Next he lifted the mass out of the bag and

had brought them to dig out prehistoric Indian mounds, of whose existence I had been assured by our guides. I hung on to this spade with religious fervor, through the bustle and turmoil of every portage, in spite of jeer and grumbles many and loud. When we discovered that the only Indian mounds that our guides knew about were of comparatively recent date and that

"Comparing them to the Palisades."

the grandchildren of the dead reds were living around, we decided that it was wiser to make no excavations just then or there.

After leaving Sulphur Lake there is a small portage into Kawin-Kago Lake. Kawin-Kago is good Ojibway for no name.

Then came one of the two longest portages on the route. Three-quarters of a mile of hill and dale satisfied our carrying ambition for a few hours, but we had had this portage held out to us as the terror of the route, and we were, after all, agreeably disappointed with the carry, and rather pleased with ourselves at the end of it, although some of us would have sold out cheaper just before we reached the summit of the

"We took one shot at the bluff opposite our camp."

divide. We were all getting hardened to the work. We had eaten our bulkiest foods first, such as fruit, canned goods, etc., and had got down to fish, bacon, and other more enduring edibles. We were too good sportsmen to shoot the ducks out of season. They were there always, and the temptation was great. We carried our packs, which averaged about seventy-five pounds, with ease and not without enjoyment. One feels like being in it whatever may be going on.

Each one of us paddled all day and carried at least half loads over the portages; wind, muscle and appetite were growing fitter every day.

We had an interesting dinner camp to-day at the abandoned Hudson Bay Co. post at Upper Green Lake.

"Sensational recollections of swift water."

One of our guides had been trader in charge of this post for the Hudson Bay Co., and had two children buried here. He spent an hour in arranging their graves. Near them were the graves of many Indians, but all of historic date. We carried the spade, notwithstanding the scoffs, hoping to find prehistoric mounds lower down. The Indian Christian is only half converted, and we found here pipes and tobacco, bottles of medicine, and all kinds of necessary articles lying by the graves of the Indian dead for their use on their journey

to the "Happy Hunting Grounds." It was very touching. One could not but admire the affection (while we bemoaned the loss of artistic ideas) of the Indians who went a hundred and fifty miles to the nearest sawmill and carried sawn lumber for palings on their backs over all the portages to inclose the remains of their dead. There is a beautiful sand beach at Upper Green Lake, and a glorious sailing stretch on the lake. Some day it may be a fashionable summer resort. The afternoon journey gave us a pleasant paddle through a chain of lakes with easy portages. We camped at about the fourth portage, near a pretty fall at a small lake enlargement of the Mississippi River. We had a just sufficient amount of honest fatigue to make us enjoy our rest, and that night as I sat watching the halfbreed cook getting the beans ready for tomorrow's breakfast, and heard the shout of approval as our sportsman hauled out three-pound fish of the gamy black and pink flesh variety, and Linklater told me that he had porcupine for breakfast, and the odor of Aleck's corn bread in the oven reached my nostrils, I realized what were the pleasures of the Indian in the old days. He had all these things as well as wild rice, berries, venison, and many edible roots and grasses to eat. He had artistic skin clothes and furs for

"Aubrey Falls, 165ft. high and broken."

winter. He lived in the most picturesque and hygienic of residences, the wigwam, and never had trouble with the servant question. There were no bald heads and no bought teeth among them.

At to P. M. cedar and balsam boughs and fragrant ferns lend delicious odor to the restful springiness which they contribute to my bed; in what better place under the sun could I be? I am fifty-two and a half years old; I have no rheumatism, no indigestion, no fatigue more than the youngest. I feel that I owe it all to my used opportunities for taking fresh air and exercise and plain food, given to all of us by the Great Unknown, who would take care of us all. Why are these opportunities unimproved by so many?

This is Saturday, the 22d of August, our fourth day out, and we find that our larder is well and wisely stocked. I will give the bill of purchases, with Montreal

Shannon's Floating Camp—Bisco Lake.

prices, for our party, which numbered seven, including the three guides:

Beets, 10 cents; peck of apples, 25.....	\$ 35
Two dozen corn, 30 cents; parsnips, 10 cents.....	40
Tomatoes, 35 cents; melon, 40 cents.....	75
Two cauliflowers, 20 cents; carrots, 10 cents.....	30
Eggplant, 10 cents; marrow, 17 cents.....	27
Half pail of jam, 50 cents; three tins of beans, 25 cents.....	1 20
Three tins beans, 30 cents; 6 pkgs Malta Vita, 90 cents.....	6 00
Twenty-five pounds corn meal, \$1; 49lbs. salt pork, \$5.....	85
One peck beans, 60 cents, 1/2 peck onions, 25 cents.....	6 75
Twenty-five pounds butter, \$5.75; 20lbs. gran. sugar, \$1.....	1 40
One gallon maple syrup, \$1.20; bag of salt, 20 cents.....	70
Pepper, 20 cents; 2 tins mustard, 50 cents.....	15
One quart vinegar.....	1 05
Beets, 30 cents; 3 packages baking powder, 75 cents.....	1 30
Two bottles of pickles, 70 cents; 4 doz. candles, 60 cents.....	2 50
Six candle lanterns, \$2.20; 6 bars soap, 30 cents.....	2 30
Three pounds coffee, 80 cents; 3lbs. tea, \$1.50.....	1 50
Ten tins of condensed milk.....	2 75
One and one half dozen assorted soups.....	6 00
Box of fruit, 60 cents; 30lbs. bacon, \$5.40.....	1 95
Plum puddings, \$1.20; marmalade, 75 cents.....	4 25
Fifty pounds sea biscuits, \$3.25; 10lbs. prunes, \$1.....	

\$44 87

The box of fruit—which came to us by a happy error—proved to be a very welcome addition. I would recommend buying fruit in Montreal, Sault Ste Marie, or in the last city in which it can be done. A bag full of whole-wheat bread, each loaf done in oil paper, is a good thing to take. It will last a week or two, and is a great feature. One always gets biscuits enough.

We had fish for supper with bacon and corn meal frit-

Abandoned Hudson Bay Post—Upper Green Lake.

kneaded it down flat into the pan. He had washed his hands conscientiously as the initial action. Twenty minutes in a Baxter stove and it was done to a turn. When it had been broken and tasted all the contestants admitted that they were out of the game, and we all began to like silent Aleck very much. The little he does say is well worth listening to; and is it not so in civilized life? The man who speaks much may be entertaining for a little while, but generally it grows upon us that what we took for sparkling burgundy is only a poor lot of *vin ordinaire*.

Noon. Our storm-bound day promises to last from daylight to dark. We tried the lake in a light canoe, but found it such wet work that the most eager of us had to admit that the loaded canoes would not be very safe and that at the best all our duffle would be soaked. We waited, wrote up our journals, sharpened our axes and ate our grub, to reduce our packs to the smallest

"A charming day we have had."

possible size for the many portages ahead of us. The Cornell boy proved to be quite an expert at bridge whist, and was by this time a general favorite. An enthusiastic spirited boy is an indispensable constituent of a successful camping party.

Toward afternoon the wind changed to the west, and we moved on from Round Island, in Canoe Lake, to the eastern shore of Sulphur Lake, making only one portage. The camping ground is not a bad one. There is plenty of pickerel in the lake. It is an ideal moose and red deer country, but one needs to leave the beaten track a half mile or so and to keep quiet. We were not in hunting season, and were careless, and we are here on a very old highway. The Indians were traveling here by the same route in bark canoes, shooting, fishing, and probably long before the Romans landed in Britain.

There are lake trout in nearly all these lakes, and plenty of them.

On Saturday, Aug. 22, we left our comfortable camp about 7:30 A. M., crossed the lake and made a small portage. We realized here our wisdom in taking plenty of tump lines or carrying straps, pack baskets and handy carry-alls generally, so that we had no loose things around us. We had one big spade and a pick-ax that received full, choice and frequent condemnation from those who had to carry them across the portages whenever I happened to be full loaded without them. I

ters; peach jam and tobacco for dessert, with songs and stories, and turned in at 9:30 P. M. We had no flies, no mosquitoes or vermin of any kind.

Sunday, August 23. It was quite cold in the night, and we enjoyed our heavy all-wool blankets. We left at 7:30 A. M. The scenery was steadily growing in beauty. We passed a most interesting Indian camp. This savage had left his valuables, including a Hudson Bay gun and an ax and two canoes, where anybody could take them. No one touched them. It would have been a degenerate white who would have taken advantage of this trustfulness of the Indian.

We met only two human beings on our long trip—two Indians paddling up the river. The developments going on on both lines of the Canadian Pacific Railway and on the Grand Trunk Railway give employment to the Indians in summer, and they hunt all winter.

There is a short-cut a couple of miles below this Indian camp which saves a couple of miles, but at very low water it might pay as well to go around the ox-bow in the river.

At the west end of the second small lake on the portage we dined on a very nice camping ground. At the portage at the east end of this lake we lost an ax and have called that the "Lost Ax Portage;" thus do many of these portages receive their names. We had much good scenery and swift water to-day. The Echelon Bluffs, at whose feet we paddled, were particularly inspiring. One could not help comparing them to the palisades of the Hudson, and generally very much to the latter's disadvantage.

Split Rock Portage, where we slept, was a particularly pretty and even more interesting camping ground. There are fissures in the rock which suck the water under ground. It comes up again with a great spurt at the foot of the falls. Some one has hung a beaver in stone—a work of mother nature—on a tree, which makes a striking landmark. We had a good bed here, although jack pine boughs made the springs. They are not as good as balsam. We had long passed the grumbling stage now, everything was good.

Monday, August 24. We selected a high sandy bank for dinner to-day. The shade was deficient and the sun hot, so that we were uncomfortable. Aleck and Linklater had made a bet as to the number of portages between Split Rock Portage and the old Hudson Bay Post on Green Lake. HBC on the map means Hudson Bay Company, or Here Before Christ—"you pays your money and you takes your choice." Aleck, to win his bet (or so the malicious among us said), took us on another merry-go-

Lower Minnesinaqua Lake.

round journey, circumventing unnecessarily an island in the river to save one portage (see the loop below Split Rock Falls), and thus won his bet. There are six portages going that way and seven the direct way. There is nothing made by going around this island when there is no bet up. Aleck's dodge helped to convince me that the Indians are of Asiatic origin, and Japanese at that.

We slept that night on the northern main shore about a mile past the island on fairly good camping ground. It began to rain just as we had finished putting up our tents, and rained pretty hard all night. We never were caught in a bad rain during all this trip, except on the last day, and then we took it from choice.

Tuesday, August 25. We started at 8:30 A. M., so that our outfit of tents, etc., might have a chance to dry. There was a mist and it was clammy, but it is better to travel in a light rain than to stay about a wet camp. We had good waterproof wraps in which to put our blankets, which never got wet.

We went out of our way nearly a mile to dine at the old Hudson Bay Post on lower Green Lake. It proved uninteresting, and we do not advise anyone to go in there.

During the afternoon it cleared up and we had a delightful paddle through Minnesinaqua Lake, which is entrancingly beautiful. It has many bits of very fine beach. Its name means the lake of the islands and points, and it well deserves the name. Here I had one of the black-backed jackfish break my greenheart rod. I treated him as I would any other pike, but I made a fatal mistake. Any other pike that I have ever had dealings with would have been thoroughly exhausted after our interview, but when this one saw the landing net he made a dash away so quickly and so powerfully that the reel could not pay out fast enough, and the old Maltby rod that had come out victor in so many contests was worsted. Maltby was the Montreal rod maker who had on his sign the words, "God save the Queen and all good honest fishermen." He is in the happy hunting grounds now, R. I. P.

Wednesday, August 26. About midway through Minnesinaqua Lake at the Narrows we climbed a high bluff and took views eastward and westward over the lovely island-dotted expanse. I have put together a twelve-foot picture (by means of three enlargements) of this spot of which I am proud. Our camp, four hundred feet below us, was most picturesque. We did not take time, however, to photograph thoroughly. We took one shot at the

bluff opposite our camp. The trip down the lake until it narrows into a river is most enjoyable. It is rapid, exciting, and yet safe. I have never seen river scenery so free from monotony. There are three portages between Minnesinaqua Lake and the junction of the Wenebagon

"Mississaga Gorge or Tunnel."

River with the Mississaga River. There are fine side trips from Lake Minnesinaqua, notably that running north from about the middle of that portion of the lake which is above or east of the narrows. We had no map of Minnesinaqua, and Aleck made me one. We had begun to think about this time that, present environments considered, our guides were better men than we were.

"Worn out."

The junction of the two rivers, the Wenebagon or Wenebago and Mississaga, is a beautiful spot. That the Wenebagon River route is the most direct and much the shortest from the main line of the Canadian Pacific Railway to the Mississaga, one can see by the map. Is it more interesting? I will know next year.

A couple of hours paddling with the help of a good

"Another quiet bit"—Mississaga River.

current brings you to Aubrey Falls, the grandest feature of the trip. Take the first turn to the left (or south) as you go down in your canoe as soon as you hear the roar of the falls. Half way across the stiff portage you turn to the right on the crest of the hills and walk over to these magnificent falls, one hundred and sixty-five feet high and broken into a multitude of fantastic shapes,

Weird, fascinating, awe-inspiring, I do not know any cataract that surpasses it in interest. We arrived late and had no sun, and yet our pictures are good. Most of these were taken with a little four by five camera, so that the field is open to the photographer who will take up a good assortment of 8 by 10 plates and lenses to suit and choose his light. I did not wait an hour for good light anywhere. We had had a most enjoyable, if fatiguing, day when we lay down to sleep at Aubrey Falls that night. The roar of the falls had become sweet and distant music to us a few seconds after laying our heads on our pillows.

Thursday, August 27. About twenty-three miles, we think it to be, of fast, exciting water nearly all the way from Aubrey Falls to Three Island Rapids. A charming day we have had, a day to think of in the coming years when we are old and will have to stay in by "our ain fireside." I hope mine will be in the forest primeval—a forest of pines and bearded hemlocks in sight of a river, a waterfall, and a lake. Indeed, I have chosen such a spot, and it is at the end of this trip between Slate Falls on the Mississaga and Lake Waquakobing, half a mile therefrom; but of these places anon.

About this day's quota of our trip I must say that we found the start at Aubrey Falls and the finish at Three Island Rapids, and every mile between, to furnish a little better canoeing, a little more rapid water, a little more excitement, and a little more of the picturesque, than any we had done anywhere before. We arrived rather late at Three Island Rapids to make good pictures, and in the morning the sun was in the wrong quarter. Three Island Camp has beauty, convenience, and piles of good dry wood, no mean item in the make-up of a good camp. We had had some wet rapids during the day and dried our clothes very thankfully at Three Island Rapids before big camp-fires. We left plenty of wood to burn for those who come after us.

Friday, August 28. Rather regretfully did we leave our camp, but we realized that we had to economize time and money. We would have liked to stay here and use our 8 by 10 plates and make some good pictures. As it is, we must be satisfied with what our 4 by 5 camera caught for us in poor light.

It is a short and interesting half day's journey from Three Island Rapids to Squaw Chute. There is plenty of rapid water and good scenery. We recommend broad canoes and short, say fourteen to fifteen feet long and three feet beam, with good stout paddles for the rapids. It is nearly all down current or slow water. Squaw Chute is a fine waterfall. There is a good portage on the

Indian Graves—Upper Green Lake.

right or west side, and a shorter or rougher one close to the fall. We found a garden here with good potatoes, lettuce, cabbage, and other green things. We did a very little pillaging, for which we would have left money if we could have found a place to leave it in. After dinner two hours' paddling brought us to the "Tunnel," as it is locally called. It is a striking feature. It is not a tunnel but a gorge, and the finest we have seen this side of the Rocky Mountains. There are one and three-quarter miles of it. We hired a team here from one of the few but prosperous settlers in this northern border settlement called Wharncliffe, Ont. There is a post-office here. The team took our three canoes while we walked and photographed the Mississaga gorge. There is only one portage between Squaw Chute and Mississaga Gorge. There is a fairly heavy sea in one of the rapids we ran, and canoes should not be overloaded. Better have one man walk around than fill a canoe with water.

Saturday, August 29. We slept at the lower end of the Mississaga Gorge. Two hours of easy paddling brought us down to Slate Falls, the best water-power on the Mississaga. There are valuable copper mines and timber about these falls, and good fishing and shooting as well. Unfortunately for us it rained hard and incessantly here, so that we could neither fish, shoot, nor photograph. It was a keen disappointment to us, as we met fishermen here who told us that both the bass and trout were biting well in the fine lakes that abound all about the falls. We had our first inside of the tent meals during the trip here at Slate Falls. We used up fifteen minutes in shaving, with a tin plate for a glass. Some of us would have liked to have waited at Slate Falls for good weather, but Dapper Bill's house was only three miles away. Our appetites were keen, and he told Cornell and the Sportsman that his wife was a great cook, and there was Algome mutton and jelly and baked potatoes and apple pies, etc., to be had at six o'clock. This won the majority of votes and we started for civilization. After dinner we portaged a half mile, from below Slate Falls into Waquakobing Lake, a beautiful sheet of clear water ten miles long by two to four wide, full of bass and lake trout, as we were told by Cincinnati fishermen who have a permanent camp there. It is only five miles from Waquakobing Lake to the Soo Branch—or Soo Pacific Line—of the Canadian Pacific Railway at Dayton Station. We might have continued down the river fourteen miles to Dean Lake Station, two

miles from the river by a good wagon road, or gone on thirty miles via the mouth of the Mississaga to Blind River Station and a good hotel, but Slate Falls and Day Mills, a small village just south of the lake where Dapper Bill lives, are centrally situated for the sportsman, where he has a dozen good bass and trout lakes within easy reach. In spite of the rain we were delighted with this section and would have liked to make a long stay, but our time had expired, and we had to move on. The delights of the trip were not spoiled by our return to civilization. We had agreed to spend one day at Desbarats, Ont. (an hour west by Canadian Pacific Railway from Dayton, see map), with some friends. We accomplished this; we saw the Indian play of Hiawatha at Desbarats and enjoyed it very much; we had some good bass fishing and a good hotel, where we arrayed ourselves in city clothes and felt very swaggar.

Next day we had late dinner in Sault Ste. Marie, near Desbarats and breakfasted the following morning in Chicago.

Thus ended our best canoe trip to date, and we have been canoeing for forty years or more. One secret of success and enjoyment was that we had no kicker and no shirk in the party. Every guide and every sportsman did all he could cheerfully. There is no experience like a canoe trip to show up the inwardness of man. Our party came out of the ordeal well, and I never want to travel with a better lot.

It is a trip that ladies can take, but they would need to give three weeks to it unless they are golf girls and athletic canoeists, when two weeks would be sufficient. Six weeks could be spent most enjoyably. We never had occasion to dry the ground by fire or warm the tents with stoves as we had done in other trips. Dry camping spots are always attainable. We look back with regret to several points at which we arrived too late or too early to enjoy the scenery or make good photos, or where we had rain. We saw countless ducks and many deer we could not shoot, thousands of moose tracks we could not follow because we were too early. We were within easy reach of great fishing we could not stop to enjoy. On the other hand, a feeling of complete physical regeneration, of unlimbered lazy limbs, and of reduced girth is with us continually, and many exquisite mental pictures and sensational recollections of swift water, of quiet bits, and of stirring, glorious scenery will remain with all the party until they reach the eternal happy hunting grounds to which we are all making a swift trip in our frail barks.

**STEAM YACHT TROPHY SOLD.**—The steam yacht Trophy, owned by Mr. F. M. Smith, has been sold, through the agency of Henry J. Gielow, to Mr. Charles E. Nygren, who will use her principally on the Hudson River between New York and Albany. She is 99ft. over all, 90ft. on the waterline, 13ft. 11in. beam, and 5ft. 4in. draft.

## Newburgh Canoe and Boating Association.

A Sketch, by the Purser.

Just twenty-three years ago a few intimate friends, amateur boatmen, agreed to share pro rata the expense incurred in housing their canoes and rowboats.

Their first "snug harbor" was an old shed built by themselves at the rear of a blacksmith shop near the foot of Fourth street, in the city of Newburgh.

Although their quarters were far from being inviting, our boating friends thoroughly enjoyed the sport and were constantly being appealed to for accommodation in the old shed. The next year they met at the home of one of their number, organized a boat club and called it the Newburgh Canoe and Boating Association.

It "took" from the first, for so thoroughly were the members inoculated with the boating fever that it became contagious and the club grew in membership and in spirit. During the following year the canoeists were compelled to vacate the "shed," which was torn down and the association had to look for another home.

They sought in vain along the busy water front of the city, until the occupant of the newly erected storehouse offered them the unused under part of the building for a club house, or, rather, a place to store their boats.

So inaccessible was the quarters, so suggestive of the haunt of the busy water rodents which infested the docks, that it led the wit of the club to call his associates "Dock Rats." They accepted the sobriquet, adopted it as their token, and from that time this well-known organization has been more familiarly known by its token than by the more dignified title under which they are incorporated. Four years later the club moved into the building which they now occupy, a two story frame building, which was formerly exhibition hall of the Orange County Agricultural Society, which was torn down and rebuilt on a dock adjoining their first home.

The upper part of the building is divided into meeting rooms, locker rooms, etc., while from a large porch across the front of the house the members have an unsurpassed view of the Hudson River and its mountainous scenery.

To the north is Dannskammer Point, to the east, across the river, is North Beacon and the Fishkill mountains, with the twin villages of Matteawan and Fishkill nestling at their base; to the south the towering Storm King and Break Neck mountains; with a vista of the U. S. Military Academy at West Point in the distance; while before you, north and south, lies Newburgh Bay, a beautiful section of the picturesque Hudson, which offers every attraction to the canoeist

and boating crank.

The lower floor of the building is devoted entirely to the storage of boats, which are launched from two drop bridges at the side of the building.

From a few canoes and rowboats the boat roster has steadily increased, until the club now has a fleet of thirty-six boats, classified as follows: Three launches, three sloops, three catboats, ten rowboats, fourteen canoes and three shells, and more to follow.

This association, organized in 1884, is therefore one of the oldest boat clubs of its kind in this section of the country; by its kind, I refer to clubs whose members, figuratively speaking, "paddle their own canoe."

During the twenty years of its existence it has seen many vicissitudes, it has had its ups and downs, storms have assailed it, and were it not for skillful seamanship on the part of its promoters it would have been a derelict; but it has weathered the storm and is to-day more staunch, more seaworthy, and the "Dock Rat" crew are more favorably known than ever.

Proof of this assertion is found in the sturdy membership, in the success which attends every function and in the increasing number of cruising boatmen who visit our "retreat."

The Dock Rat boat house has become a mecca for the cruising men, and the hospitality extended the "cruiser" has made the N. C. and B. A. most favorably known from the "Sound" to the St. Lawrence.

The wandering boatman always finds a greeting, and the hand of fellowship is ever extended to greet the coming or speed the parting guest.

Ask any A. C. A. man who attended the "meets" twenty years ago at Plum Point, Croton Point or at Grindstone islands.

Ask them if they know the "Dock Rats." Ask them if they remember "Nate Smith," "Jim" Van Dalfsen or "Bunt" Edgar, and you'll start a flow of talk that would fill the pages of FOREST AND STREAM all summer.

Ask the cruising man of later years where he stops when going up or down the Hudson, ask him if he knows the "Dock Rats" and he'll tell you that the whole crew of sixty-five—from Commodore Cantine down to the "cabin boy"—are the jolliest rodents he ever met.

Another year will probably find the "Dock Rats" in a home of their own. They have so outgrown their present quarters that a committee was appointed at the annual meeting to look for a site on which to build a modern, up to date boat house.

The association is governed by a Board of Directors consisting of the five officers and four lay members. The newly elected Board is: Francis M. Cantine, Com.; Dr. W. J. Oakey, Vice-Com.; Howard A. Schultz, Captain; Wm. H. Smiley, Purser; Geo. F. Chadborn, Treasurer; Jas. T. Van Dalfsen, Clarence B. Moss, Directors, two years; Fred V. Carpenter, Bertram C. Montfort, Directors, one year.

### Milwaukee Letter.

MILWAUKEE, May 3.—Lake Michigan yachtsmen are in a fine stir of excitement over the prospects for this season, and the ordering and arrival of new yachts is keeping the skippers on both shores in a fever of anticipation. In the first place, the Columbia Y. C. fears that its hold on the Lipton trophy is precarious, and in order to cement the cinch Dr. F. W. Holmes, of the Columbians, has ordered a 21-footer, a reduced Sallie VII, which is being built at Gloucester. From Detroit comes the report that John H. Smedley, of the Detroit Y. C., has a bidder for the Lipton trophy on the stocks somewhere, and rumors have been current here that R. B. Brown had ordered a cup-winner to represent the Milwaukee Y. C., but Mr. Brown flatly denies that there is any truth in the tale, and affirms that he will devote his energies to Pilot this year. And to make his assertion good he is having Pilot changed, in order to improve her sail-carrying power.

Harry Landauer, of the Milwaukee Y. C., has purchased Thistle II, a Boston creation from the boards of Crowninshield last year, and she is now on her way to this city. The Boston craft formerly belonged to a gentleman named McKinnon, who sailed very little last summer, owing to the death of his father, and it was by the merest chance that Mr. Landauer secured the craft, which is 34ft. 8in. over all, 7ft. 5in. beam, and 21ft. on the water line. Charles Wild and Newell Ellis, in turn, purchased Vagabond from Mr. Landauer.

The Milwaukee fleet will mourn the loss of Illinois this summer, as Joseph Uihlein sold her recently to C. S. Roberts, of the Chicago Y. C.

The Milwaukee Y. C. has prepared a fine programme for its members this year, the regatta committee having provided amply for the real sailors, and the entertainment committee having arranged a series of dinners, concerts, dancing parties, smokers and vaudeville performances, which fairly makes one's mouth water. The opening gun was fired on the evening of April 30, when Commodore Vilas presided over a dinner at the Athletic Club. On the following day, last Sunday, the

club house was opened with appropriate ceremonies. The first real race on the programme will be sailed on Memorial Day.

Albert O. Trostel, of Milwaukee, is having a Seawanhaka trophy challenger built at Oshkosh, by Jones & LaBorde, to sail in the preliminary trials on Lake Winnebago, at Oshkosh, next month. Frederick Pabst is also having his Comet III, built late last summer, groomed for the same trials, and Frank Gates and F. H. Libbey, of Oshkosh, are also contenders in the trials, as they have both ordered yachts built for the big event.

The Waukesha county yachtsmen are preparing for a lively season, with the Pewaukee Y. C. showing by far the most ginger. Ten members of that flourishing organization have ordered one-design boats from LaChappelle, of Pewaukee, to race in this season. When the craft are completely rigged and launched the ten skippers will draw for their perpetual ownership and race them all season for appropriate trophies. Pine Lake will be the scene of the annual regatta of the Interlake Regatta Union this summer, and on that historic water the craft representing the Pewaukee, Oconomowoc Lake, Nagawicka and Pine Lake clubs will sail for the Pabst trophy.

There is a possibility that automobile boats may be introduced here this summer by Joseph Uihlein. It is understood that he has been negotiating for a 70-footer with a speed of thirty miles an hour, to run on Lake Michigan. He will buy an auto yacht if he can obtain one which will come up to his requirements, if it can be delivered prior to July 4.

A. W. FRIESE.

**VIXEN II. LAUNCHED.**—On Saturday, April 30, the new high speed steam yacht Vixen II. was launched at Morris Heights. The boat was built for Mr. John D. Archbold. She is 118ft. over all, 114ft. waterline, 12ft. breadth, and draws 4ft. 6in. The yacht is double planked, and is fitted with twin screw triple expansion engines and improved boilers fitted with oil fuel burners. The builders guarantee a speed of 24 miles.

### British Letter.

A MOST interesting link with the past generation of yachtsmen was broken at the beginning of April, when the death occurred at Gosport Hants of the famous old Clyde skipper, John Houston, of Largs. Houston was a contemporary of the celebrated designer and yacht builder, the late William Fife, Sr., of Fairlie, and it was while in command of that able designer's masterpiece, the 80-ton cutter Fiona, familiarly known owing to the beauty of her lines as the Fawn o' Fairlie, that Houston achieved his greatest reputation. From 1865 to 1876 Fiona was sailed by him with such skill and judgment that she won sixty-seven prizes, including seven Queen's cups, one of which, however, had to be relinquished on an absurd technicality. The cup referred to was won on the Mersey in 1866, but had to be given up because Fiona was protested against on the ground that her racing flag was not of the size named in the club rules. The total value of prizes won by her during the period named above exceeded £4,500, which was considered a very large sum in those days, and it should be stated that during two seasons—1871 and 1874—she was not fitted out at all. It is safe to say that the nursing hand of the famous skipper was a chief factor in Fiona's phenomenal success, for, though a beautifully proportioned vessel, she was called upon to sail against bigger and newer yachts than herself, and Houston's master hand at the tiller, combined with his alert intelligence, snatched many prizes away from faster boats during the latter years of her racing career. There is no doubt that Houston was in advance of his time as regarded his ideas, and even in those early days he strenuously advocated putting the ballast outside on the keel. It is said that if he had had his way the old Fiona would have been so fitted, in which case she would have been a far greater terror than she was. He was also in favor of steering wheels for big yachts, as he said that handling a tiller in large vessels when racing threw so much strain on the arms as to ruin that delicacy of touch which is such an important factor in enabling one to determine whether a vessel is in thorough trim and doing her best.

Houston came of a well-known Largs family. He commenced his racing career in 1860, but it was not until five years later that he obtained permanent employment on Fiona, first with Mr. Lafone, and then with Mr. Boucher, who bought the famous cutter the year after she was built, and with this latter gentleman he served for twenty years in his three Fionas, the Fawn o' Fairlie, the schooner Fiona, and the steam yacht of that name. Although Houston spent the last years of his life at Gosport, his death is mourned by the people of Largs as sincerely as though he had never left his native place, and it is felt by the yachting world in general that one of the greatest skippers of the last century has passed away.

The question has been continually raised lately as to whether it would not be advisable for yacht clubs to offer prizes for a schooner class. No doubt such a move would be a popular one with owners of schooner yachts, and possibly some good racing might result from it, but two things are to be considered. The first point is whether the clubs have the necessary funds to offer prizes, and the second is, will the owners undertake to go the rounds regularly like the class racers and handicap boats do? One of the greatest difficulties club committees have to contend with in making out prize lists is the uncertainty as to how the classes they cater for will fill, and it is notorious that schooners could long since have had more attention paid them if their owners would only take the trouble to notify the clubs of their intention of racing before the last moment. Nothing is more disappointing than for a sum of money to be set apart for a certain race—in the case of schooners it would necessarily be a large sum—and then for that race to fall through and the money, which might have been devoted to other purposes, to lie idle. It would be a good thing for yacht racing if a good schooner class could be started and kept together as a handicap class, for first-class racing under the present rating rule seems to be in a hopeless way, and with a fleet of schooners sailing matches on handicap time there would be every incentive to build a good wholesome type of modern fast cruiser, which is the best kind of vessel for all-round purposes yet invented.

Messrs. Connell's new 65ft. rater which has been lying so long on the stocks at Fairlie is now practically finished and ready for launching. It is stated that the 65-footer Tutty, which was formerly owned by the Messrs. Connell, has found a purchaser, and that she will be raced at the principal regattas. The old 40-rater Carina is also having an extensive overhaul, so these three vessels will probably fight it out this season as a handicap class. Fitting out is now general on all coasts, and many of the small clubs have already started the season's racing.

E. H. KELLY.

## Boston Letter.

Boston, April 30.—At the spring meeting of the Boston Y. C., held at the town house, Rowe's Wharf, Wednesday, April 27, the Regatta Committee submitted a fine schedule of races, including squadron runs on two cruises. The first of these cruises is arranged upon invitation of Vice-Commodore E. P. Boynton to the club squadron to visit his summer home at Five Islands, Me. The club has extended invitations to the Portland and Bath Y. C.'s to join the squadron, and on July 20 there will be a race at Sheepscot Bay, open to yachts of these clubs. The second cruise will be at the last of the season, the cruising yachts of the squadron running to Provincetown, where they will join the racing fleet, just completing the South Shore circuit. For the first cruise cups have been offered by Vice-Commodore Boynton, Rear Commodore Walter Burgess and several members of the club.

The regular series of races for the year will consist of five open events and four club races. The yachts enrolled in the club will be rated according to their places in the open events for the club championship. Commodore B. P. Cheney has offered championship cups in the active racing classes, and, in addition, the Regatta Committee will give cash prizes for each event. There will also be a series of special club races for handicap classes and 18ft. knockabouts. These races will not interfere with the schedules of other clubs, as they are intended to provide only for yachts which remain at Hull throughout the season, and do not participate in events elsewhere. Mr. George H. Wightman has offered cups to be awarded the yachts winning the highest averages in the series. The following is a complete schedule of the season's fixtures:

June 4, Saturday—Club race, South Boston.  
June 11, Saturday—Special club race, Hull.  
June 4, Saturday—Club race, South Boston.  
June 11, Saturday—Special club race, Hull.  
June 17, Friday—Y. R. A. open, Hull.  
June 25, Saturday—Special club race, Hull.  
July 9, Saturday—Club race, Marblehead.  
July 16, Saturday—Start of cruise; squadron run, Hull to Marblehead.  
July 17, Sunday—Squadron run, Marblehead to Portsmouth.  
July 18, Monday—Squadron run, Portsmouth to Portland.  
July 19, Tuesday—Squadron run, Portland to Five Islands.  
July 20, Wednesday—Races in Sheepscot Bay.  
July 23, Saturday—Special club race, Hull.  
July 27, Wednesday—Midsummer series of Y. R. A. open races, Hull.  
July 28, Thursday—Midsummer series of Y. R. A. open races, Hull.  
July 30, Saturday—Midsummer series of Y. R. A. open races, Hull.  
Aug. 2, Tuesday—Y. R. A. open, Marblehead.  
Aug. 10, Wednesday—Club race, Marblehead.  
Aug. 13, Saturday—Special Club race, Hull.  
Aug. 20, Saturday—Club race, Hull.  
Aug. 27, Saturday—Special club race, Hull.  
Sept. 2 to 4, Friday to Sunday—Cruise to Provincetown and Marblehead.  
Sept. 3, Saturday—Races at Provincetown.  
Sept. 10, Saturday—Special club race, Hull.  
Mr. Louis M. Clark, founder of the Yacht Racing Association of Massachusetts, and who recently re-

signed from the executive committee, has been presented by the committee with the following testimonial in the form of an illuminated tablet in gold frame:

"Yacht Racing Association of Massachusetts:

"The executive committee, realizing the loss to this Association by the resignation of Mr. Louis M. Clark, the founder of the Association, three years its president and eight years a member of the executive committee, extend to him this testimonial in appreciation and recognition of his valuable services and untiring efforts on behalf of this Association and yacht racing in general.

(Signed) "C. F. Adams, 2d Pres.,  
"C. C. Clapp,  
"B. S. Permar,  
"Walter Burgess,  
"James R. Hodder,  
"Sumner H. Foster,  
"Harry H. Wiggin,  
"A. T. Bliss, Sec.

"Boston, April 11, 1904."

Mr. H. A. Morss, of the special committee of the Eastern Y. C. on ocean race, has received twelve entries so far. Of these there is one each from the Boston, Eastern, Corinthian, Atlantic, Larchmont, Norwalk and Knickerbocker Y. C.'s and five from the New York Y. C. Mr. Morss has also received communications from the owners of two schooners of the Eastern Y. C. fleet, whose yachts are of greater water line length than 50ft., but who are anxious to take part in the ocean racing. As it is considered that there may be more yacht owners of the same mind, it is quite possible that a class for larger schooners will be provided.

Mr. E. A. Boardman has designed a 50ft. water line auxiliary yawl for D. W. L. Baum, Vice-Commodore of the Chicago Y. C., which is being built by the Crane Shipbuilding Co., of Detroit. She will have the distinction of being the only steel yawl of her size on the Great Lakes, and no expense will be spared on her construction. She will have a white enamel coating on the outside, and the inside finish will be in mahogany. Her lines are similar to those of the New England fishermen, a form calculated to stand the gales of Lake Michigan. Her first trip will be a cruise of 700 miles. This designer also reports the following sales: Eighteen-foot knockabout, owned by Mr. A. D. Irving, to Mr. Henry G. Hall, of Salem; 25ft. speed launch Spark, owned by Mr. G. D. Silsbee, to Mr. George Lee. Spark's name has been changed to Firefly, and she will take part in the races of the Eastern Y. C. She has a speed of twelve miles with an eight-horse power Buffalo motor.

Mr. Walter C. Lewis, chairman of the membership committee of the Boston Y. C., who recently returned from a trip to the Bahamas, brought with him from Nassau the finest specimen of tortoise that ever came from that section. It will be on exhibition at the Rowe's Wharf house of the Boston Y. C. for a few days, together with some very interesting oil paintings of Nassau scenes by Mr. Frank O. Small.

The complete outfit of spars and sails of the 22-footer Peri II, owned by Mr. George Lee, was destroyed by fire at the Fenton yard, Manchester. A new set of spars for her has been completed at Lawley's, and she is to have a new suit of sails by Messrs. Cousins & Pratt. She will be put in commission in a couple of weeks and will be ready for the opening of the season. She will also enter in the open race for 22-footers around the Isle of Shoals. This boat was designed by Mr. E. A. Boardman, and was a likely looking craft when she was launched last season. On account of necessary alterations, however, there was not much of an opportunity to show what she could do. It is expected that she will be raced steadily on the Y. R. A. circuits this season.

A catboat is being built by Mr. Howard Linnell, of Savin Hill, for Mr. C. C. Collins, which has more than the usual amount of room in a craft of her size. She is only 22ft. on the water line, but she has 6ft. 3in. head room. She is centerboard with a draft of hull of 3ft. 2in. Mr. Collins, who designed the boat himself, is a devotee of the cat rig, and generally goes single handed in all kinds of weather.

JOHN B. KILLEEN.

## Interlake Yachting Letter.

CLEVELAND, O., April 22.—The yachting outlook on the lakes was never more promising than at present. More boats are building than in previous years, and the sail-makers have their hands full. At Buffalo they have the 15ft. restricted class fever, and five boats have been built. Their owners are Robert Heussler, Ernest Hall, Major Frank E. Wood and Edward B. Green. Geo. Clinton and J. Allen Keeney are the owners of the fifth. The boats were built by Wier Bros., of Hamilton, Ont., and are completed. They make a very trim little fleet and should furnish good sport for their owners. One twenty-one-footer has also been built for H. L. Chamberlain, of the Buffalo Y. C. She was designed by Hand, and her owner believes she will be a flyer. It is his intention to tune the boat up thoroughly and try her out against the 21ft. class of Detroit boats at Put-In-Bay during the regatta of the Interlake Yachting Association, and if she proves equal to the test will be shipped to Chicago and entered in the Lipton cup races.

Several large yawls are being built for Buffalo yachtsmen, and Messrs. Maytham & Johnson are considering a design of a 30ft. racing boat turned out by Owen, of Hamilton. It is probable they will have the boat built. The Buffalo Y. C. is having a defender constructed for the Hall cup, and the canoe club is also having one built. There is keen rivalry for possession of this cup, which has been held for two years by the Buffalo Y. C., but the canoe men have hopes of recovering it this summer.

There is little doing at Erie in the way of new boats, and this is about the only town in the circuit where the absence of new boats is noticeable. However, one 21-footer for the restricted class has been built. She is a clean-cut little craft, of moderate proportions.

The usual spring repairs are in evidence, and despite the lack of new boats the members of the Erie Y. C. look for a good season. Fully forty boats will attend the meet of the I. L. Y. A. at Put-In-Bay, Ohio. Commodore Morrison is having an eight-horse power engine installed in his cutter. A number of small launches have been purchased by club members, and there seems to be plenty of interest in this branch of the sport. Cleveland is looming up strong, and will capture a goodly number of the prizes offered. The White Ribbon will be the representative in the 30ft. class, with Chloris in the 25. An unnamed boat, recently completed at Maltby's yard for Messrs. Watterson & Hershing, will be a formidable opponent in the 21ft. class, while Suzanne will represent the 18ft. class. Suzanne did not come up to the expectations of her owners last year, but better results are hoped for this season. She was one of the Massachusetts Y. R. A. restricted class, with a limited sail area which was decidedly too small for her powerful body. Mr. Geo. D. Hall, her owner, has decided to have new sails, right up to the limit of the "law" on fresh water, which will be 150ft. in excess of what she formerly carried. Messrs. Whiton & Nash are contemplating the purchase of Rooster II, another of the Massachusetts Bay boats, but to date the deal has not been consummated. If she is purchased she will be entered in the races for the Walker cup at Detroit, and the Lipton races at Chicago. Still another valuable boat has been added to the Lakewood Y. C., which will be the representative of the racing game in Cleveland. This one is of small proportions, but of "mighty" accomplishments. She is Myth, formerly owned by Fred Pritchard, of Toledo, but now the property of B. F. Davies, Jr. Her dimensions are approximately 18ft. 6in. over all, 11ft. 4in. water line, with a beam of 5ft. 2in. She carries 250 sq. ft. of canvas, and in two seasons of constant racing has never been beaten in her class. It was not an uncommon occurrence for her to go above her class and come out victorious. Jag, a boat of the Seawanhaka type, has been sold by Rudolph Malm to C. F. Clemments. Mr. Clemments will have a new suit of sails made for Jag, and she will again be seen among the racing fleet. She was not in commission last year. The Vinco has been sold by Ralph Cobb to a syndicate headed by L. F. Body. Toledo is the scene of activity, and many new boats are building there for local yachtsmen and others. Frank Craig is having a mammoth speed launch built at the Craig yards. She is of steel, and will be roofed in length. This craft is expected to develop extreme speed, being of the pronounced speed type, and will be driven by two powerful motors. J. W. Hepburn is building a 21ft. cruising yawl for R. L. Lockwood of Cleveland. She is about completed, and will be shipped in a few weeks. R. W. Harrison is building a speed launch for Lacy Bros. She will be equipped with an eight-horse power Lacy engine. Her dimensions are: Length, 25ft.; beam, 4ft., with a draft forward of 1ft. The same builder is at work on a launch for Henry Sullivan. Her length is 25ft., beam, 6ft. 6in., with a depth of 3ft. and a mean draft of about 18in. She will have a four-horse power Lozier engine. Enright, Oberton and Puritana are being rebuilt, and will again be in the racing game. The Winkle, owned by Fred Pritchard, is to have a new rig, and will be somewhat smaller than the previous one. The object is to squeeze her into the 18ft. class. Commodore E. T. Affleck and crew have gone east for the Hussar, the new flag-ship of the Toledo Y. C. Detroit is the mecca of the fresh water cities, and with her five new 21-footers will be very much in the running. The adoption of the 21ft. restricted class by this club was one of the most advanced steps taken by an Interlake club, and while several of the older yachtsmen shook their heads, the Country Club has profited by the move, and to-day stands pre-eminent. The class has made rapid strides since its adoption last summer, and the Country Club will have seven entries. At the last meeting of the I. L. Y. A. the class was adopted as a special restricted class. Since that time members of other clubs have been skirmishing around in an endeavor to land boats eligible to that class. The inclination seems to drift toward the smaller classes. A 16ft. restricted class was recently adopted by the Detroit Y. C. One boat is being built for Rear-Commodore Lloyd, of that organization. She was designed by Carlton Milby, now of Detroit, and is a good looking boat. She is of the compromise type, and has a good cabin for a boat of this size. Her over all length is 27ft. 6in.; waterline, 16ft.; beam, 7ft. 4in., and 2ft. draft. The Michigan Yacht and Power Co. is building a number of auto boats. One of the best specimens which they are building is to be sent to the St. Louis Exposition as an exhibition of the work done in Detroit. The boat is 28ft. over all, with a draft of 12in., and she will be equipped with a sixteen-horse power engine of the four cylinder type. Her speed is estimated at between fourteen and sixteen miles an hour. Her interior will be elaborately fitted out and she will be planked in mahogany and finished bright. F. A. La Roche, of New York, is having three boats of the same type and dimensions, though they will not be fitted out as elaborately as the other. R. Miller, of Pittsburg, is having a beautiful mahogany auto boat built at Detroit. Mr. Miller is not especially after speed, but it is believed the boat will develop about thirteen miles an hour. She will be the finest craft ever turned out by a Detroit builder. Her dimensions are 33ft. over all, 6ft. beam and 32in. draft. The engine, which is being built by the H. P. King Co., is a four-cycle, four-cylinder type of twenty-horse power. M. A. Manville, of Chicago, is also having an auto boat built at Detroit of practically the same dimensions as the Miller boat, though her beam will be nearly a foot less. The real flyer in small boats is being built for W. K. Jackson, of Buffalo. She will be 40ft. over all, 5ft. beam and 16in. draft. She will be constructed of the lightest material, the engine bed being constructed of aluminum, weighing only twenty pounds and capable of supporting a sixty-horse power automobile engine. Mr. Jackson hopes to get a speed out of her from eighteen to twenty miles an hour.

Schweikhart is building a handsome launch for Dr. Wadsworth Warren, of Detroit. She was designed by Mr. L. C. Steers, also of Detroit. Her over all length

will be 42ft., 9ft. beam, draft, 3oin. She will be equipped with a three-cylinder, sixteen-horse power Fay & Bowen engine, and it is thought will have a fair turn of speed. F. Smith, of the Olds Motor Works, is also having a boat built of the auxiliary cruiser type. Length over all, 33ft.; waterline, 25ft.; beam, 9ft. 8in., with a draft of 3ft. She will carry 750 sq. ft. of canvas, and have an engine capable of driving her six miles an hour. Barney Nehls is also building an auxiliary, which is rapidly nearing completion. The Great Lakes Boat Works has an order for 100 16ft. launches for C. H. Bloomstrom, of Detroit. This firm is also building a 28ft. launch for Alderman William Hillger. She will be equipped with a ten-horse power gas engine, and have a speed of twelve miles an hour. Dr. J. W. Mortimer is building a 20ft. launch, to have a speed of thirteen miles an hour. This is a remarkable speed for a craft of this size, but the doctor has confidence that his launch will attain that figure per mile. There are more than 150 launches building at Detroit, lack of space permitting fuller mention at this time.

C. W. SCHMIDT, JR.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

W. E. NOXON DROWNS.—Mr. Willis E. Noxon, a lawyer of Minneapolis, Minn., fell overboard on April 24 from his brother's yacht, Ellen, anchored in New Rochelle harbor and was drowned. He was 40 years old.

COCK ROBIN LAUNCHED.—Mr. C. S. Eaton's new sloop Cock Robin was launched from the yard of the builders, the Herreshoff Mfg. Co., on April 23. She is 40ft. waterline and 52ft. over all. Cock Robin is a substantially-built cruising boat of good accommodation and snug rig.

MORRIS Y. C. HOUSE BURNED.—The Morris Y. C. house at Pelham Park was destroyed by fire on the evening of April 24. The fire started in one of the lofts where sails were stowed, and much of the members' property was destroyed.

IMPERIAL Y. C. OF GERMANY'S SCHEDULE.—The following schedule has been arranged for by the Imperial Y. C. of Germany:

June 18—Dover to Heligoland; handicap.  
June 21—Open race on the Elbe, near Cuxhaven.  
June 22—Open race in Kiel harbor.  
June 24—Open race in Kiel Creek.  
June 25—Open race in Kiel harbor; the motor boat race of the German Automobile Club takes place in the Baltic the same day.  
June 26—Open race in Kiel Creek.  
June 27—Closed race in Kiel harbor.  
June 28—Open race from Kiel to Eckenförde.  
June 29—Handicap race from Eckenförde to Kiel.  
June 30—Open race in Kiel harbor.  
July 1—Open race from Kiel to Travemünde.  
June 23, 25, 27 and 30—Special class races in Kiel harbor. After the Kiel week an open race will be sailed in the Bay of Lubeck, off Travemünde.  
July 4—Open race from Travemünde to Warnemünde.  
July 6—Open race off Warnemünde.  
July 11—Handicap from Heligoland to Dover.

JAMAICA BAY SCHEDULE.—The committee in charge of fixing the dates for open races has made up the following schedule, which has been adopted:

June 5—Bergen Beach Y. C., start 1 P. M.  
July 9—Canarsie Y. C., start 3 P. M.  
August 7—Old Mill Y. C., start 3 P. M.  
August 28—Jamaica Bay Y. C., start 2 P. M.  
The Association races will be sailed on July 4 and Labor Day.

ROYAL CANADIAN Y. C. ANNUAL MEETING.—The annual meeting of the Royal Canadian Y. C. was held on Saturday, April 30, at the club's town house in Toronto. The following officers were elected: Com., Stephen Haas; Vice-Com., George H. Gooderham; Rear-Com., Dr. A. A. Macdonald; Honorary Treasurer, G. E. Macrae; Executive Committee—J. T. Johnson, F. G. Cox, L. S. McMurray, Richard A. Donald, D. M. Harman, J. D. McMurrich, C. A. B. Brown, W. H. Pearson, J. Morgan Jeliott and Dr. B. L. Riordan. Commodore-elect Haas referred to the unavoidable absence of the retiring commodore, Mr. Æmilius Jarvis, but was sure that the members would be glad to know that Mr. Jarvis is improving daily, and that he would be soon back with them again. Several members spoke in favor of building a new island club house. The financial statement showed the club was in a highly satisfactory condition.

COMMODORE BOURNE'S APPOINTMENTS.—Commodore Bourne, of the New York Y. C., has appointed Commodore J. D. J. Kelley Fleet Captain. Dr. J. M. Woodbury has been reappointed Fleet Surgeon.

BAYSIDE Y. C. COMMITTEES.—The commodore of the Bayside Y. C. has made the following appointments of committees for the coming season: Regatta Committee—Charles L. Willard, chairman; Duncan Curry, Herbert Wigan. House Committee—Charles E. Colman, chairman; H. T. Weeks, I. T. McKnight, Frank J. Page. Entertainment Committee—William H. Johns, chairman; Harvey G. Rockwell, Leo Bugg. Library Committee—James H. Lee.

SYBARITA'S SKIPPER.—Captain Gomes, the well-known British skipper, will be in command of Mr. W. Gould Brokaw's yawl Sybarita this season.

BRISTOL Y. C. FIXTURES.—The regatta committee of the Bristol (R. I.) Y. C., composed of Messrs. Edward H. Tingley, chairman; Walter S. Almy and Wallis E. Howe, have arranged for open regattas on the following days: Saturday, June 25.

Tuesday, August 16.

Saturday, September 10.

The rules for allowance and measurements and sailing will be those of the Bristol Y. C., except on August 16, when they will be those of the Narragansett Bay Yacht Racing Association.

BISCAYNE BAY Y. C. BOOK.—We are indebted to Mr. Kirk Munroe, of the Biscayne Bay Y. C., for a copy of the club book for 1904.

ELSA II. CHARTERED.—Mr. Andrew W. Rose has chartered the steam yacht Elsa II. from Mr. Evans R. Dick through Messrs. Gardner & Cox.

STEAM YACHT CATANIA CHARTERED.—The Duke of Sutherland has chartered his steam yacht Catania to Mr. Larz Anderson.

Dr. G. Montgomery Tuttle has chartered the auxiliary schooner Idler from Mr. Henry T. Sloane through the same agency. They have also sold the knockabout Persimmon to Mr. W. Butler Duncan.

## Rifle Range and Gallery.

### Fixtures.

June 12-20.—National Schuetzenbund Festival, Union Hill, Schuetzen Park, N. J.

### A Nation of Riflemen.

Editor Forest and Stream:

The greatest danger in the use of firearms arises more from ignorance in their handling than from any other cause. And this ignorance is owing to a lack of practice. To become highly proficient in their use, one should be taught to handle them at an early age, the same as it is necessary to begin young in order to become a polished musician.

Come with me, whoever will, any drill night, and we will look upon a startling example of carelessness in the handling of firearms. The place is a militia armory, and we will see full-grown men snapping rifles point blank at each other. Had they been early trained in the handling of these dangerous tools, they would never think of pointing them at one another. I was once a witness of an act of this kind that might have proved fatal. The rifle was loaded, but, fortunately, with a blank cartridge. This saved the victim's life, but his face and eyes were filled with powder as it was.

Perhaps restrictions in the use of firearms might prove beneficial in the cause of game protection, and in preserving our song and insectivorous birds. And it is highly desirable that our game and birds should be saved. But it can truthfully be said, without affectation of maudlin sentiment, that the welfare of one's country should be considered even before that of its dumb animals. Early education along the lines of game protection could travel hand in hand with early instruction in the handling of firearms. The men—aye, and women, too—of any country who are proficient in the handling of firearms are a strong and natural protection of that country against its foes. Fervid patriotism is early instilled into the breasts of our children as the fundamental principle of their education, and this is as it should be. But, while the mind is fortified by love of country, the defensive education does not keep pace with the mental. It should be taught that it is as patriotic to be familiar with the use of firearms and a good shot as it is to love one's country. In fact, that the two should go together.

Is the whole wide world not witnessing a glaring example to-day of the inability of a people to handle firearms? Where are Russia and Japan fighting, and what are they fighting for? Are they fighting in the country of either? No. They are fighting on ground that belongs to other nations—China and Korea. And in order to control those nations, either with or without their consent. In population the countries which are the "bone of contention" outnumber the countries which are struggling for that "bone" more than two to one, but they are unarmed and unpracticed in the use of modern arms.

We will suppose that the reader owns a valuable piece of property, and two armed men should come along and decide that the property would just about suit them. They each know you are unarmed, so they peremptorily order you to stand passive while they proceed to "shoot each other up," so that the survivor can take possession of your property. You would be exactly in the position of China and Korea, or any other nation whose inhabitants are unarmed, and can't shoot.

Suppose again, that the people of China and Korea were proficient in the use of firearms, and that every home contained one or more up-to-date rifles, how long would it be before invading armies of any nation would melt into oblivion, like an Arctic snow under an Arabian simoon?

Then suppose that we were as unfamiliar with the use of firearms as China and Korea, how long would it be before our lands and waters would swarm with the armies and navies of the robber countries of the earth?

Then, is it wise to weaken ourselves by passing laws which will surely cause more or less ignorance in the use of the rifle? Would it not be far better for our nation to pass laws compelling the teaching of rifle practice in the primary department of the public schools? And, along with the educational instruction in the use of arms, could be instilled a knowledge of the necessity of game and other dumb animal protection. Had the young men who form our militia companies received early instruction in the proper handling of firearms, they would not to-day point and snap rifles at one another. There would be a scarcity of "didn't-know-it-was-loaded" fools in the land.

In these highly cultured days of subtle and treacherous diplomacy, it is difficult to tell what nefarious scheme may be hidden under the "velvet paw" of international "friendship." Judging by what we see and read, the very thing that appears to be for our good to-day may flame into war to-morrow. For illustration: Our interchange of courtesies with Spain, when the Maine was sent to Havana, and a Spanish warship visited New York. The result is history—we shot the best. Who can tell but some crafty diplomat may be at this moment concocting some scheme which may land us in another war within a month? "Thou knowest not what a day may bring forth."

It is a matter of history that subtle diplomacy moves cautiously where the advantage is on the opposite side. And in war the scales of advantage would balance to the side of a people who were universally familiar with the rifle and skilled in its use. In

these days of 23-knot ships, no civilized country is really isolated from the rest of the world. As big as is our country, and as mighty as is its strength, we must not forget that we are bounded on the north and south by foreign countries. Truly, we are the staunchest of friends to-day, but some unforeseen question may arise to-morrow which may precipitate war before we can realize it. And there might be a combination of allies, with a supply base right on our borders.

For the patriotic welfare of our country, we should become a nation of riflemen and women. We should take a personal interest and teach our children the use of the rifle. My own children are all girls, but each of them knows something about firearms. In fact, my eldest daughter is a fairly accurate shot with the rifle. I consider it a duty I owe to my country that my children should have some knowledge of these things.

We should not forget that we are but 80,000,000 in population, while China and Korea are five times as much. That they have but little say in the war which is being carried on in their territory, but in the division of spoils they will be the most affected—what degrading humiliation! And we should take the lesson to heart that if they were proficient in the use of the rifle, no country would arrogantly force an entrance into their land by right of might. And that no single nation or combination will ever dare attempt an invasion of our own land if it is known that every wayside, rock and tree will thunder forth a tornado of fire and leaden death, sped on its mission by marksmen who have been taught that "only the shots that hit count in war!" Such is the only safe argument to insure lasting peace between nations, and to eventually force universal settlements of international disputes. at the Hague.

WILLIAM H. AVIS.

HIGHWOOD, Conn., April 2, 1904.

### New York Central Corps.

The winter gallery shoot of the Central Corps, during the past season, had an attendance above the average. The scores were of a high order. R. Gute was first on the ring target. J. N. F. Seibs was first for the best center shot on the bulls-eye target.

Best Bulls-eye by measurement, 4in. carton: J. N. F. Seibs 21½ degrees, W. Schillingman 24, B. Eusner 31½, F. Rolfes 33½, H. D. Muller 34, J. Speckmann, Jr., 36, H. Schiller 40½, C. Gerken 42½, R. Gute 44, H. von der Lieth 46, D. Scharninghaus 73, F. Kost 50, Geo. A. Viemeister 48, J. von der Lieth 54, F. Schroeder 54, A. Rohde 51, F. Engelking 62, W. Wessel, Jr., 63, F. Brodt 64, A. Ritterhoff 67½, W. J. Daniel 70, H. Roffmann 70½, F. Schiller 74, John Hacke 76, J. Feldscher 78, H. A. Ficke 79, J. Winters 89, F. Jergens 100, S. Dettloff 103½, C. F. Tietjen 112.

Most rings: R. Gute 4,363; F. Kost 4,207; D. Scharninghaus 4,208; H. D. Muller 4,217; J. N. F. Seibs 4,204; G. A. Viemeister 4,171; F. Rolfes 4,099; B. Eusner 4,058; J. Feldscher 4,029; F. Brodt 4,013; J. von der Lieth 4,029; C. Gerken 4,006; W. Wessel, Jr., 3,899; H. Schiller, 3,873; F. Engelking 3,838; H. Roffmann 3,805; A. Rohde 3,786; H. von der Lieth 3,657; C. F. Tietjen 3,720; W. Schillingman 3,568; H. A. Ficke 3,503; J. Speckmann, Jr., 3,103; J. Hack 3,268; A. Ritterhoff 3,045; F. Jaegens 3,007; S. Dettloff 3,005; P. Schiller 2,820; W. J. Daniel 2,693; J. Winters 2,512.

THE Central Corps opened this summer practice shoot at Union Hill Park on April 21. The coming festival of the National Bund in June is creating a deal of interest.

In the competition on April 21 Gus Zimmermann was first on the ring target; R. Busse was first on the man target.

Ring target, three-shot scores, possible 75: Gus Zimmermann 71, R. Busse 69, D. Scharninghaus 67, W. Koch 66, H. D. Muller 66, W. J. Daniels 65, G. A. Viemeister 65, F. Kost 63, E. Berckmann 62, F. Schrader 61, H. Koster 60, H. Bockmann 59, J. Jordan 58, W. Wessel 58, H. A. Ficke 57, A. Ritterhoff 57, J. von der Lieth 56, W. Schillingman 56, F. Baumann 55, Val. Horn 55, Ch. Gerken 55, E. Richards 54, Hy von der Lieth 51, Capt. C. F. Tietjen 50.

Man target: R. Busse 56, H. D. Muller 55, Gus Zimmermann 55, Jos. Jordan 54, W. J. Daniels 53, F. Schroeder 52, H. Roffmann 52, Wm. Koch 52, D. Scharninghaus 52, D. Meersse 51, H. Bockmann 51, F. Kost 51, J. von der Lieth 50.

Company bulls-eye: D. Scharninghaus 2, H. D. Muller 2, W. J. Daniels 2, R. Busse 2, Gus Zimmermann 2, H. Bockmann 2, W. Koch 1, Val. Horn 1, E. Richards 1, Jos. Jordan 1, F. Baumann 1, D. Meersse 1, C. Gerken 1.

Trophy, bulls-eye: H. D. Muller 5, J. von der Lieth 3, F. Schroeder 3, R. Busse 2, Richards 1, E. Berckmann 1, D. Scharninghaus 1, H. von der Lieth 1, W. Wessels, Jr., 1, Ch. Gerken 1, Geo. A. Viemeister 1, Gus Zimmermann 1.

Cash bulls-eye: H. D. Muller 3, E. Berckmann 3, Gus Zimmermann 3, D. Scharninghaus 2, R. Busse 2, W. J. Daniels 2, Jos. Jordan 2, F. Baumann 2, E. Richards 1, H. Roffmann 1, J. von der Lieth 1, Ch. Gerken 1, A. Ritterhoff 1, D. Meersse 1, F. Jaeger 1.

### Miller Club vs. Hudson Club.

A HOME and home team match was shot between teams from the Miller Rifle and Pistol Club, of Hoboken, and the Hudson Rifle Club, of Jersey City, N. J., on April 17-24. The first match was held on the Hudson Club ranges on the 17th inst., the teams consisting of ten men. The Miller Club won with ease.

The second match was held on the Miller Club ranges with six men to each team. Like the first match, the Millers again won.

First match, April 17, 25 shots, ten men:

Miller Club—Rosenbaum 607, Unbehaum 596, Goldthwaite 598, Gabriel 592, Owen Smith 599, F. Bischoff 592, C. Miller 594, D. Dingman 586, P. J. O'Hare 602, C. Bischoff 606; total 5972.

Hudson Club—Gannon 589, McCartney 598, Kraus 599, Barker 609, Mahlenbrock 573, Barning 591, Rebhan 595, Keefe 566, Norman 571, Thiel 565; total 5856.

Second match, six men teams, 50 shots:

Miller Club—Rosenbaum 1210, Goldthwaite 1192, C. Bischoff 1216, Owen Smith 1177, Unbehaum 1194, P. J. O'Hare 1216; total 7205.

Hudson Club—McCartney 1195, Kraus 1190, Barning 1183, Barker 1200, Gannon 1174, Rebhan 1203; total 7145.

### Cincinnati Rifle Association.

THE following scores were made in regular competition by members of the Cincinnati Rifle Association at Four-Mile House, Reading Road, April 24. Conditions, 200yds., offhand, at the 25-ring target. Payne was declared champion for the day, with the fine score of 232. The day was stormy and a strong, gusty wind from 3 to 6 o'clock quarters, prevailed all day. The scores:

Payne	232	216	213	211	211	Hoffman	209	204	203	199	196
Nestler	219	216	212	211	210	Trounstein	203	201	199	196	188
Hofer	215	206	201	200	188	Freitag	201	198	194	193	190
Odell	212	206	205	204	200	Lux	195	194	190	189	187
Hasenzahl	211	210	210	209	203	Drub	195	194	190	189	187
Roberts	210	209	205	202	202						

## Zettler Rifle Club.

The results of the Zettler Club winter contest are as follows: Wm. A. Tewes wins the first premium for the most points for the season. He is first on the list for the best fifty scores, and also first on the prize list for the most points. Harry Fenwirth wins the first prize on the bullseye target for the best center shot made during the season. Fenwirth also wins the Zimmermann trophy.

Four premiums for the most rings for the season: Wm. A. Tewes, 33,074, \$10; L. C. Buss, 32,957, \$5; L. P. Hansen, 32,844, \$3; A. Kronsberg, 32,708, \$2.

Best fifty scores: W. A. Tewes, 12,356, \$15; L. C. Buss, 12,322, \$12; L. P. Hansen, 12,305, \$10; A. Kronsberg, 12,263, \$9; Keo. Schlicht, 12,243, \$8.

Best thirty-five scores: R. Gute, 8,594, \$7; E. H. Van Zandt, 8,575, \$6; C. G. Zettler, Jr., 8,573, \$5; A. Moser, 8,533, \$5; W. A. Hicks, 8,503, \$5.

Best twenty-five scores: B. Zettler, 6,087, \$4; C. G. Zettler, Sr., 6,090, \$4; L. Maurer, 6,053, \$4; H. C. Zettler, 6,046, \$3; A. Begerow, 6,020, \$3.

Zimmermann trophy: Harry Fenwirth.

Prizes for most rings: W. A. Tewes, 33,074, \$10; L. C. Buss, 32,957, \$9.92; L. P. Hansen, 32,844, \$9.86; A. Kronsberg, 32,708, \$9.82; C. G. Zettler, Jr., 32,644, \$9.82; W. A. Hicks, 32,276, \$9.70; B. Zettler, 32,039, \$9.63; H. Fenwirth, 31,646, \$9.51; C. G. Zettler, Sr., 32,171, \$9.68; G. Schlicht, 30,281, \$9.15; G. J. Bernius, 24,017, \$7.21; R. Gute, 23,059, \$6.92; E. H. Van Zandt, 23,017, \$6.91; H. C. Zettler, 20,246, \$6.07; L. Maurer, 19,018, \$5.70; A. Moser, 18,121, \$5.43; Thos. H. Keller, Sr., 17,214, \$5.15.

Bullseye target, 4in. carton, the best center shot to count by measurement: Harry Fenwirth, 15 degrees, \$6; H. C. Zettler, 19½, \$5; B. Zettler, 21, \$4; R. Gute, 24, \$3; W. A. Tewes, 25, \$3; E. H. Van Zandt, 25, \$3; G. Schlicht, 26½, \$2; L. C. Buss, 27½, \$2; A. Kronsberg, 28½, \$2; C. G. Zettler, Jr., 29, \$2; W. A. Hicks, 30½, \$2; C. G. Zettler, Sr., 32½, \$2.

THE winter gallery contest of the Zettler Rifle Club was brought to a close at the club's headquarters, New York city, on Tuesday night, April 19.

The contest the past season has been somewhat of a disappointment from the fact that there were hardly enough members who filled out their scores to be eligible for the prizes on the programme. The scores shot at the last shoot will be found appended. The list of winners for the season, with the total of their scores will be published in the next issue of FOREST AND STREAM.

Ten-shot scores, 25-ring target, distance 75ft., offhand, 100 shots: Geo. Schlicht 2422, L. P. Hansen 2416, W. A. Hicks 2398, Thos. H. Keller, Sr., 2306.

Fifty shots: W. A. Tewes 1227, Aug. Kronsberg 1222, Louis C. Buss 1221, A. Moser 1198, Chas. G. Zettler, Jr., 1198, Hy. C. Zettler 1193, Chas. G. Zettler, Sr., 1184, B. Zettler 1179, Louis Maurer 1173, Hy. Fenwirth 1170, Aug. Begerow 1170, Geo. J. Bernius 1167.

Extra scores: L. P. Hansen 2430.

## The New York Corps.

OVER ninety members of the New York Corps were at Union Hill Park, April 29, at the opening of the Corps' summer practice. Capt. John H. Hainhorst was in the best of humor, for the conditions presaged a very successful year.

Ring target, 10 shots, possible 250: J. C. Bonn 213, B. Zettler 212, G. Ludwig 209, Gus Zimmermann 204, D. Peper 192, J. Facklamm 191, J. G. Tholke 186, H. D. Meyer 184, H. Lohden 183, F. Facompre 182, J. F. Cordes 182, J. Schmidt 179, Otto Schwanemann 179, H. Mesloh 178, J. H. W. Meyer 173, H. B. Michaelson 174, H. Nordbruch 173, A. W. Lemcke 171, J. H. Klee 170, C. Roenig 170, N. G. L. Beversten 167, R. Ohms 162, J. H. Kroger 162, Geo. Offermann 161, W. Schultz 161, A. Sibberns 160, M. Tietjen 154, H. Brunning 154, H. Haase 153, G. Thomas 152, H. Buthfer 151, H. Gobber 150, J. H. Hainhorst 149, J. H. Cordes 149, L. O. Hagenah 145, H. Meyn 145, H. Heinecke 143, J. D. Welkins 141, H. Offermann 141, J. H. Doscher 141, C. Brinkmann 140, J. N. Hermann 140.

Man target, 3 shots, possible 60: G. Ludwig 58, J. G. Tholke 56, Gus Zimmermann 57, J. G. Bonn 53, Otto Schwanemann 55, J. Facklamm 53, F. Facompre 50, G. Thomas 50, C. Schmitz 50, J. Schmidt 42, C. Mann 40.

Bullseye target: Otto Schwanemann 4, Gus Zimmermann 3, J. H. Meyer 2, J. H. Doscher 2, H. Haase 1, H. Quinten 1, J. F. Cordes 1, C. Schmitz 1, C. Boesch 1, H. Winter 1, H. Lohden 1, A. Sibberns 1, H. D. Meyer 1, D. Bohling 1, J. C. Bonn 1, F. H. Ehlen 1, H. Meyn 1, H. Butler 1, B. Zettler 1, J. G. Tholke 1, A. W. Lemcke 1, J. D. Wilkins 1, J. Facklamm 1, H. B. Michaelson 1, J. Schmidt 1.

## New York City Corps.

THE City Corps held its practice shoot at Union Hill Park, on April 27.

Ring target, 10 shots, possible 250: R. Schwanemann 209, W. Grapentin 206, A. Kronsberg 202, O. Schwanemann 202, J. Facklamm 201, R. Bendler 190, C. G. Zettler 190, H. G. Radloff 164, J. Riedl 164, A. Wiltz 124.

Man target, 3 shots, possible 60: J. Facklamm 52, A. Kronsberg 52, W. Grapentin 51, R. Bendler 46, C. G. Zettler 45, Otto Schwanemann 39.

Bullseye target: Bendler 7, O. Schwanemann 5, J. Facklamm 4, A. Kronsberg 4, W. Grapentin 2, R. Schwanemann 2, C. G. Zettler 1.

Point target, most points: O. Schwanemann 49, R. Bendler 35, J. Facklamm 29, W. Grapentin 29, R. Schwanemann 21, A. Kronsberg 19, C. G. Zettler 14, H. C. Radloff 9, A. Wiltz 5, M. Loescher 1.

## Rifle Notes.

The Independent New York Corps, captain, Gus Zimmermann, will hold a two days' festival and prize shoot at Union Hill Park on May 24 and 25. The shoot will be open to all comers, with a liberal cash programme.

The St. Louis Central Sharpshooters' Association will hold an open tournament at the World's Fair. Two or three days each week will be devoted to prize target shooting. The series of contests will continue through a period of six months.

The programme of the New York State Rifle Association is now ready for distribution, and can be obtained of Dr. W. B. Short, secretary, 242 Lenox avenue, New York. It provides eighteen rifle and revolver matches, some of which are military, some club, others open to all. The competition will take place at Creedmoor, Sept. 12-17.

"Modern Rifle Shooting from the American Standpoint," by W. G. Hudson, M.D., gives full information on all the essentials of rifle shooting, theoretical and practical. Dr. Hudson is famous as an expert, practical rifleman at all ranges, and also has achieved fame as a ballistic expert. His independent, skillful experiments have resulted in important improvements on rifles and ammunition. In this work he treats of rifles, bullets, triggers and trigger-pulls, equipments, sights and sighting, adjustment of sights, aiming, optics, positions at all ranges, targets, ammunition, reloading, cleaning, etc. Price \$1. For sale by Forest and Stream Pub. Co.

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

## Fixtures.

\*Western Pennsylvania Trapshooters' League tournaments. C. G. Grubb, Sec'y, Pittsburg.

The Fairview, N. J., Gun Club holds shoots Friday and Saturday of each week. Targets, 1½ cent. Visitors are welcome to participate.

## DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The match between Messrs. Wright and Batten is to be shot on some day before Jan. 1, instead of May 1, as stated in our last issue.

The Herron Hill Gun Club, of Pittsburg, Pa., will hold shoots on Wednesdays and Saturdays of each week. All visitors are welcome to participate.

In the contest for the English Hotel cup, on the grounds of the Indianapolis, Ind., Gun Club, April 30, between Messrs. Michaelis and Moller, the former won by a score of 88 to 86.

The eight-man team race on April 30 between Princeton University and the Crescent Athletic Club, of Brooklyn, was won by Princeton; scores 319 to 290. Each man shot at 50 targets. The contest took place at Princeton, N. J.

The Dubuque, Ia., Gun Club will arrange for a new series of trophy shoots in the near future. The club's tournament, May 17 and 18, is an assured success. For programmes address the secretary, Mr. F. M. Jaeger, Twenty-seventh and Jackson streets.

On Saturday of last week at the shoot of the Wawaset Gun Club, Wilmington, Del., Mr. Edward Banks, of that city, but recently of the village of Manhattan, broke 103 targets straight, and a total of 185 out of 192 shot at, an average of over 96 per cent. This is the record run of Delaware and numerous other places.

Mr. H. E. Winans, of the Poughkeepsie, N. Y., Gun Club, at the weekly shoot of that club last week, scored the sixth and final win for the Traver cup, a much desired and warmly contested trophy. In the last contest, Messrs. Winans and Smith tied for it, and the tie was shot off four times before the winner could be determined.

In the second contest for the automobile, at Newark, on Saturday of last week, Mr. Louis W. Colquitt, of Orange, N. J., and Mr. C. W. Floyd, of New York, made high score. They tied on 92 out of 100. At the first shoot Mr. Floyd was high with 91. Mr. Sim Glover, at the first shoot made high professional score, 92, for the cup. Mr. J. A. R. Elliott, for the same cup, made 95, high score at the last shoot.

The Garfield Gun Club, of Chicago, opened its season on April 30, and had thirty shooters in attendance, a number large enough to compare favorably with an average tournament. The famous professional trapshooters, Messrs. H. W. Cadwallader, Jack Fanning, Fred Lord, and Mrs. Bennett were visitors. Dr. J. W. Meek scored first win in Class A with 24. Mr. Ballard won in Class B with 22, and Mr. Birkland, Jr., was first in Class C with 21.

High average at the two-day shoot held on the grounds of the Herron Hill Gun Club, the first of the Western Pennsylvania Trapshooters' League for 1904, was won by Mr. D. A. Upson, of Cleveland, O., with a total of 316. Mr. J. A. R. Elliott was as close a second as it was possible to be, scoring only one less. Four teams contested in the team race. The New Castle team won. The members of it were Messrs. Atkinson, Shaner and Hickey.

Mr. Will K. Park, in Sporting Life last week stated that Pennsylvania will be the next State to introduce a bill similar to that recently passed in New Jersey against pigeon shooting, and warns the shooters that the way to meet such action is to organize and oppose it from the start. That is a perfectly sound warning, but the history of such happenings is that the shooters vehemently and informally think of organization after the deed is done.

At the Interstate Association tournament, held under the auspices of the Americus, Ga., Gun Club, April 27 and 28, Mr. Chas. G. Spencer made high average, 386 out of 400, a 96.5 per cent. record. Mr. H. B. Money was second with 383, better than a 95 per cent. performance. Mr. Walter Huff was third with 377, 92.5 per cent. Of the amateurs, Mr. H. D. Freeman was high with 365 out of 400; Mr. Frank Heidt, second, broke 361, and Mr. J. M. Napier was third with 358.

The Warwick, N. Y., Gun Club has issued the programme of its series of 1904 shoots, the dates of which are May 13, June 10, July 8, Aug. 12, Sept. 9 and Oct. 14. There are eight events, alike for each shoot, alternately 10 and 15 targets, entrance 75 cents and \$1. Extra events to suit visitors. Targets, 1½ cent. Rose system governs the division of moneys. Manufacturers' agents from necessity and others from choice may shoot for targets only at 2 cents. Shooting commences at 1 o'clock. Dr. A. W. Edsall is the secretary.

The Boston Gun Club will hold their fifth annual tournament and team shoot on their grounds at Wellington, Mass., on May 18. There are thirteen events on the programme; four at 10, the remainder at 15 targets. Events 11 and 12, 15 targets each, constitute the five-man team match; all shoot from scratch. Shooting commences after the arrival of the 9:25 train. All shooters are invited. Lunch served on the grounds. Special prizes offered by the club: Gold watch charm to the amateur making the best programme average, and leather gun case to second amateur. Targets 1½ cent. Loaded shells obtainable on the grounds. Guns and cartridges forwarded to Kirkwood Bros., 23 Elm street, before May 18, will be delivered on the grounds free of charge.

At the close of the season, April 14, at Monte Carlo, the Prix de Cloture handicap, £100 and a gold medal, entrance £2.85, second, 30 per cent; third, 20 per cent., there were twenty-four contestants. A high wind prevailed, and only one contestant, Count de Robiano, remained in the seventh round. Commenting on the series of Monte Carlo contests, the London Field states: "The most successful of the English competitors during the season have been Mr. Roberts, with the triennial championship, worth

£472, and five other prizes of £179, making altogether £651; Mr. Mackintosh, who won eight prizes, worth £400, including the Monte Carlo handicap, and Mr. Walter Blake, who took ten prizes, worth £382; Mr. Woolton won six prizes, worth £230; Mr. Lindsay Scott, three, of £225; Mr. Percy Thellusson, three, of £211; Mr. C. Robinson, four, of £206; Mr. Ker, seven, of £195, and Mr. Asplen, five, of £149."

All indications are that the tournament of the Wawaset Gun Club, at Wilmington, Del., May 12 and 13, will be a success in every particular. A large number of shooters, both professional and amateur, have signified their intention to participate. As it is an amateur tournament, manufacturers' agents will be permitted to shoot for targets only. Targets will not be thrown over 50yds. A sliding handicap, 16 to 20yds., will establish a reasonable equity in the competition. Five per cent. from the net amount of the purse in each event will be deducted, and the total sum will be divided pro rata among the amateurs who shoot through the programme without winning a sum equal to their entrance. Guns and ammunition, prepaid and marked in owner's name, sent care of E. Melchior, Jr., 214 King street, will be delivered on the shooting grounds free of charge. For programmes address the secretary, W. M. Foord, 218 West Sixth street.

The large sportsmen's goods establishment of Messrs. Von Lengerke & Detmold, 318 Broadway, New York, had a narrow escape from destruction by fire on Tuesday of last week. The fire started in one of the upper floors of the building. It was extinguished by the energetic work of the fire department before the whole building was involved. Engines, water tower and hook and ladder truck, with the congested traffic and crowds, made at that hour the corner of Broadway and Pearl street a scene of extraordinary activity and interest. On the following day an event of still greater interest transpired. Five members of the German nobility, recently arrived and en route westward, visited Messrs. Von Lengerke & Detmold and purchased some rapid fire shotguns. Three of the distinguished visitors were Durchlaucht Prinz von Ratibor Schillingsfürst, Durchlaucht Prinz Karl von Ratibor, and Durchlaucht Erbprinz von Ratibor. The names of the other two I did not learn. They are said to be famous shots in Germany.

BERNARD WATERS.

## IN NEW JERSEY.

### Hell Gate Gun Club.

Carlstadt, N. J., April 26.—There was a 4 o'clock wind and a good lot of birds, but there was an irritating delay till 2:40 o'clock, waiting for the arrival of the latter. A special meeting of the club was called for Friday of this week. Mr. Dannefeler leads all other club members in the number of points so far this year.

The club contest, 10 birds per man, resulted as follows:

Van Valkenburg	28	7	22*2022222	8
Dr Davis	26	5½	1001200200	4
Schorty	30	7	2020*21222	7

### Jeannette Gun Club.

Guttenburg, N. J., April 22.—There was a 7 o'clock wind. The birds were a good lot and mostly drivers. In the shoot-off Schortemeier won Class A; Mr. Pape won Class B; Mr. Sanders won Class C for the third and final time, winning all three times with Mr. Schortemeier's gun. Mr. Schortemeier acted as referee and scorer:

Kroeger, 30.....	2*12122102	8	Rohlf, 28.....	0221210121	8
Bouken, 25.....	1000120001	4	Pottman, 28.....	2221001121	8
Schorty, 32.....	0121222222	9	Meyerdierck, 28.....	2001111111	9
Pape, 28.....	0121212121	8	J Mohrman, 28.....	2112*12101	8

Brunie, 28.....	121211010	8	..	..	..

Shoot-off, Class A:

Schorty	22	Steffens	2*
---------	----	----------	----

Challenge medal, Mohrman was challenged by Hainhorst, and retains the medal as per the following score:

Mohrman, 28.....	01111221121210	13
Hainhorst, 28.....	12020112210111	12

### Princeton University—Crescent A. C.

Princeton, N. J., April 30.—The eight-man team contest to-day between the Princeton University Gun Club and the Crescent Athletic Club, of Brooklyn, was won by Princeton by the wide margin of 29 targets. Each man shot at 50 targets. For Princeton Mr. O. D. Munn, '06, broke 44 and was high. Remsen broke 48 for the Crescent team and was high man for the shoot. Scores: Princeton Team—Munn 44, Gaines 43, Archer 42, Pell 42, Pardoe 39, Stutesman 37, Mortan 34; total 319.

Crescent A. C. Team—Remsen 48, Palmer 47, Brigham 42, Stevenson 41, Southworth 41, Stokes 30, Alphenson 29, Van Dever 12; total 290.

### Montclair Gun Club.

Montclair, N. J., April 30.—Notwithstanding the frequent showers this afternoon, there was a very good attendance at the regular Saturday afternoon shoot of the Gun Club, some sixteen marksmen being in attendance.

Event 1 was for practice only. Events 2 and 3 apply on the contest for the Parker gun—members' three highest scores of 50 each from now to Sept. 1 to count. Event 4 was handicap match for members, 25 targets, 50 cents entrance, the prize a sole leather gun case, was tied for by Messrs. Benson and Howard. On the shoot-off, miss-and-out, it went to Mr. Benson on the ninth round. Event 5, same conditions as No. 4, prize, a cartridge case, was won by Mr. Benson, who broke 22 targets, and with a handicap of 5 made him an easy winner.

Messrs. Schneider and Glaister were the guests of the club.

Events:	1 2 3 4 5	Events:	1 2 3 4 5
Targets:	10 25 25 25 25	Targets:	10 25 25 25 25

EDWARD WINSLOW.

### Pattensburg Gun Club.

Pattensburg, N. J., April 30.—The regular monthly shoot for medals took place April 30, with ten contestants. There were three ties for second medal, resulting in Capt. Holbrook's favor. Harry Gano captured the first medal.

After the match for medals a Jack Rabbit event, 5 targets each, 25 cents up, was shot. H. Gano got 4, A. E. Holbrook 4, C. W. Bonnell 5, N. Stamets 4, W. S. Bowlby 3, R. Stamets 3, H. P. Milbern 4, H. Fleck 4. This sport creates quite some amusement. Our club has a new trap on its way, and will in a few days have it in use.

The medal contest follows:

N Stamets	11111110111111111111	22
H Gano	11011111111111111111	23
H P Milbern	11011111111111111111	22
R Stamets	11011111111111111111	21
C W Bonnell	11001101111111111111	19

Money and Spencer tied for high gun on the first day, and the tie was shot off at 100 targets to-day, Money winning by 97 to 94, and taking the silver cup given by the club.

### Garfield Gun Club.

CHICAGO, April 30.—Appended scores were made on our grounds, to-day on the occasion of our opening shoot for the season. Dr. Meek won Class A trophy, 24; Bullard, won Class B trophy, 22; Birkland, Jr., won Class C, 21.

The day was a fine one for trapshooting, and about thirty shooters took advantage of it for an afternoon's outing. Mr. Cadwallader, Jack Fanning, Fred Lord and Mrs. Bennett, all traveling shooters, were present, and set a rather fast pace for the boys. We enjoyed their company and hope to see them often.

## WESTERN TRAP.

## Kansas City—St. Louis.

KANSAS CITY, Mo., April 25.—Yesterday the long-expected St. Louis team arrived in this city, and though the weather was very damp, and, in fact, rain poured down, the boys gathered at the park and the shoot could not well be postponed.

The day was dark, and though the birds were damp, there was no discount on their flying, as the shooters found out. Not a straight was made, though Planck and Tipton for Kansas City each scored 24. Spencer was high for St. Louis with 23.

When Tipton and Mermod had shot their first 10, there were prospects of a straight, but Mermod fell down on both the eleventh and twelfth. Tipton kept it up until the twenty-first round, when an incomer that should have been smothered was lost.

The race was for \$100 a side, each shooting at 25 live birds. The score resulted in the World's Fair defeat, 102 to 110.

It will be remembered that last October the Kansas City team paid a visit to St. Louis, and there met defeat by the small margin of one bird—and that one bird owing to a decision by the referee, caused the Kansas City men to feel as though they should have had a tie. But that is all over now.

At the close of the shoot the Kansas City crowd banquetted the defeated shooters at the Baltimore Hotel. The scores, Intercity team shoot:

Kansas City.	
Planck	24
Holmes	23
Clayton	23
Elliott	23
Tipton	24

St. Louis.	
Clark	20
O'Neil	18
Spencer	23
Kenyon	19
Mermod	22

There were several target sweepstakes shot after the close of the team race.

As the St. Louis team was delayed reaching the park, the Kansas City boys and the visitors engaged in a 15 live-bird preliminary, in which A. Holmes, Chauncey Powers and Dave Elliott went straight. Fred Gilbert, Ed O'Brien and Tom Norton each dropped one. The scores:

Clayton	13	Norton	14
Tipton	12	O'Brien	12
Planck	13	D Elliott	15
Powers	15	Gottlieb	13
Gilbert	14	Holmes	15

## O'Neil—Holmes.

Kansas City, Mo., April 25.—To-day, while the rain was pouring down and the Blue River was rising fast and foreboding evil to the Elliott tournament, which starts to-morrow, little Joe O'Neil won a 50 live-bird race for \$50 a side from A. H. Holmes, of this city.

The birds were not in good condition, owing to the prolonged wet weather. O'Neil had rather the best of the draw, yet shot quick and accurate, and did not need the second barrel to any extent. Holmes lost three by the twenty-first round, and O'Neil was then in a shape to keep the lead, which he preserved to the end, losing but one to Holmes's 6.

There were four target events. Crosby and Clayton tied in the first on 15; Mermod won second; Riehl third; Budd and Gilbert went straight in the last.

The park is at the present writing almost entirely surrounded by water, owing to a rise in the Blue; yet the prospects are that the Elliott shoot will not be hindered thereby.

Harlow Spencer, of St. Louis, is still in the city, and will shoot a 100 live-bird match for \$100 before the week is over.

## Zanesville Gun Club.

Zanesville, O., April 23.—The first shoot of the season was held Thursday. The shooting ground has been improved. One of the most successful enterprises was that of placing a motor to run the magautrap, as now every target falls at 55yds. unless broken by the shooter.

The new grounds will be dedicated on May 4, at which time there will be sweepstake shooting, 16yds., and no handicap, money divided so that the high man can win something. The following scores were made by the big five who could not longer keep their guns within their cases, at 75 targets, viz.: Moore 71, L. A. Moore 70, Brown 68, Dennis 66, Warner 66.

## Rensselaer Tournament.

Rensselaer, Ind., April 21.—The shoot held here the past two days was, in point of numbers a surprise to all concerned. The club here is small and the manager was imported, yet the programme was an inviting one, and many large clubs would be proud of a tournament wherein there were twenty-seven who shot the whole programme through.

The traveling representatives were here in plenty. There were Messrs. Kirby, Trimble, Head, Vietmeyer, Fanning and Mrs. Bennett.

Chicago sent a full squad, and others came from all over the northwestern part of the State. Lem Willard certainly made a fine score, as did Manager Brown.

The weather on the whole was good, and in this respect was an improvement over that of Darlington, Paducah, Kansas City and other pointss where shoots were held at the same time.

Uncle John Deitrick had all the boys going some, as at one time he made 51 straight.

Mrs. Bennett's showing was a revelation to the natives, as there are so few women who travel and shoot that they are at all times a curiosity when at the traps. The scores:

## Wisconsin Southern League.

Darlington, Wis., April 21.—What should have been a good shoot was cut down both in attendance and number of targets by the bad weather that prevailed yesterday.

It was a surprise to meet the Dago, and he showed that he has lost none of his old-time "gun craftiness," as he lost but 4 out of the 100 targets shot at. The scores:

Events:	1	2	3	4	5	6	7	8	Shot	Broke.
Targets:	10	15	15	10	15	10	10	10	at.	Broke.
R. E. Orton	5	14	13	7	13	14	8	9	100	83
W. T. Campbell	9	13	15	9	12	14	9	10	100	91
L. Dodge	9	12	14	9	14	12	7	7	100	84
W. S. Warren	7	10	12	8	13	13	8	5	100	76
L. Canfield	9	13	12	7	11	11	8	10	100	81

C. W. Budd	10	15	13	10	14	14	10	10	100	96
G. Bixby	9	9	7	9	11	14	6	7	100	72

League events: Peters cup, two-man teams:

Dago 21, Campbell 20; total 41.

Orton 21, Barto 20; total 41.

Voss 19, Warren 21; total 40.

Gordon 17, Phillipson 8; total 25.

Target cup, handicap: Orton (19) 11, Campbell (19) 17, Dodge (19) 19, Warren (16) 15, Voss (18) 21, Bixby (16) 20, Barlow (16) 18, Gordon (16) 17.

Live bird cup, handicap, 10 birds: Dodge (32) 9, Campbell (30) 8, Orton (30) 7, Barlow (26) 9, Budd (32) 9, Campbell (28) 9. Barlow won on shoot-off.

## Albuquerque Gun Club.

Albuquerque, N. M., April 22.—The gun club of this place was out yesterday, and three of the members shot at 100 each. The score of J. Barnett was especially fine. He is expecting a new gun, and when he gets it broken in, he will challenge Garrett for the handicap trophy. The scores:

Events:	1	2	3	4	5	Events:	1	2	3	4	5
Targets:	25	25	25	25	10	Targets:	25	25	25	25	10

J. Obermeyer	15	15	15	15	15	Ortiz	23	23	23	23	10
P. J. Hawley	9	9	9	9	9						

## Elliott's Tournament.

KANSAS CITY, Mo., April 26.—The big tournament, which is to be only a forerunner of the 1905 shoot, started this morning with some thirty-four shooters going through the programme. The major part of them were the "left over" from the shoot of last week. The weather was not good, and the scores were extremely low, owing to the handicap, which was an extreme one.

The opening was delayed consequent by the trains that were held back by high waters, hence the shoot ran into the dark.

The first six events were divided Rose system, 7, 5, 3, 2; the other six on the per cent. plan, 40, 30, 20 and 10.

With \$100 added money and \$50 for added average prizes, the shoot was interesting.

The high amateur average went to J. F. Thomas, of Pleasant Hill, Mo., with the low score of 166.

The high professional average was won by Frank Riehl, with 171; Gilbert, 169.

The weather promises good, and the shooting will develop into several individual matches.

While the shoot on targets was being held back, Dave Elliott and Alex Mermod shot a 25 live-bird race. Mermod won easily with 23 to 20.

Mermod was then challenged by Wm. Clayton for the same kind of a race, and Mermod won again easily, 24 to 22. The scores:

## First Day, April 26.

Targets:	15	15	20	15	15	20	15	15	20	15	15	20	Broke.	
Bush, 18.	13	12	17	11	10	13	14	9	14	10	13	14	150

## SOME ADVANTAGES IN SHOPPING

**OUR** Business is both Wholesale and Retail, which enables us at all times to carry a big stock of every requisite for the Angler, and at prices that are the lowest.

### RODS.

- "OUR SPECIAL."** The best we handle, selected stock, waterproof extended ferrules, German silver mountings, all lengths and weights from 8½ ft. to 10½, and 3½ ounce to 8. . . . . Each \$25.00
- "VICTORY."** Made by the same workmen as those who turn out "OUR SPECIAL." rod, made with the same care, but stock not so carefully selected. This rod we guarantee against all imperfections in material and workmanship. All lengths and weights. . . . . Each \$15.00
- "PERFECTION."** A strictly hand-made rod, Calcutta stock, German silver trimmings, closely whipped with silk between rings, mounted on velvet covered form. Length 9 to 10½ ft. . . . . Each \$10.00
- "THE HARRISON."** Selected English greenheart, bronze mountings, cedar hand grasp, extra tip in tip case, guaranteed free from all imperfections in material. Length 8½ and 9½ ft. . . . . Each \$15.00
- "KNOX."** Our best medium grade split bamboo, fine quality Tonquin cane, fly rods fitted with snake guides, 9 to 10½ ft. . . . . Each \$6.00
- "No. 812."** Fine quality Lancewood, closely whipped, cork handle grasp, length 9 to 10 ft., on covered wood form. . . . . Each \$6.00
- "No. 817."** The mountain trout rod, good quality Lancewood, with red cedar butt, closely whipped with silk, length 8½ ft., weight 5 ounces. . . . . Each \$3.50
- "No. L2."** Good grade Tonquin stock, closely whipped with two colors of silk, cork hand grasp on covered form, either fly or bait. . . . . Each \$3.50

**"No. M1."** Similar to rod L2, not quite as good a selection of stock, same lengths and weight, either fly or bait. . . . . Each \$2.50

We can supply any of the above rods in the heavier weight or bass rod with reel plate above the hand. The "Victory," "Perfection" and "Knox" rods are made in the extra short lengths for bait casting, 5½ to 6½ ft.

### SPECIAL BAIT CASTING RODS.

- "No. 92."** Split bamboo, one piece, detachable butts, medium weight, length 5 ft., double hand grasp, with finger pull on reel seat, agate top and large casting guides. . . . . Each \$6.00
- "No. 91."** Same as No. 92, two piece, double hand grasp and finger pull on reel seat, large casting guides, length 5½ ft. . . . . Each \$5.00
- "BORNEO CASTING."** This new cane has become very popular in a medium weight casting rod. This cane is new and resembles Pepper cane very closely. This rod is made up in the casting lengths from 5 to 6½ ft. The butt is made of Borneo cane and the tips of split bamboo, mounted with German silver trumpet guides which are tied on with silver wire, making it impossible for guides to come off. . . . . Each \$5.00
- "No. 76."** Hand made Lancewood castings, two piece, double cord hand grasp, with finger pull and large casting guides. . . . . Each \$4.00
- "No. 71."** Two piece Lancewood casting, similar to No. 76, with extra tip and trumpet guides. . . . . Each \$2.50

### SALT WATER RODS.

- "THE JERSEY SHORE."** Hand made Greenheart striped bass rod, fine quality stock, length 6½ ft., double trumpet guides, agate top, 14 inch cord wound hand grasp. . . . . Each \$10.00
- "THE BORNEO WEAK FISH."** Same general description as the Borneo casting two piece, length 6½ ft., medium weight with 14 inch hand grasp. . . . . Each \$5.00

### REELS.

- "No. P3."** Fine quality rubber and German silver trout reel, steel pivots, raised pillar, capacity 80 yds. . . . . Each \$6.00
- "No. 194."** Fine quality rubber and German silver trout reel with German silver protected handle and adjustable click, capacity 60 yds. . . . . Each \$4.00
- "B 53½."** Rubber and nickel plated trout reel with protected handle and adjustable click, capacity 60 yds. . . . . Each \$2.00
- "THE TRIUMPH CASTING REEL."** This reel we consider the finest medium price casting reel that has ever been put on the market, both in the workmanship, appearance and running quality. It has a *take-a-part* device by which the reel can be taken apart in a few seconds without the use of a screw driver. Full quadruple multiplying and steel pivots, Kentucky pattern with 1⅝ inch spool, made in two sizes. . . . . 60 yds., \$5.00; 100 yds., \$6.00
- "TACONIC CASTING REEL."** A light weight, noiseless, quadruple casting reel, Kentucky pattern, 1⅝ inch spool, long steel bearings, capacity, 50 yds. of casting line. . . . . Each \$3.50
- "VICTORY CASTING JEWELLED BEARINGS."** A medium weight, Kentucky pattern casting reel with round disk and jewelled bearing, capacity, 80 yds. . . . . Each \$5.00
- "ONEKO CASTING REEL."** Rubber and nickel plated quadruple casting reel, steel pivots, rubber side plates with metal bands protecting the same, capacity 80 yds. . . . . Each \$3.00

### LINES.

- "No. 321."** Our best quality enamel silk casting line, a rather dark mottled color which is practically invisible when in the water. The line is thoroughly waterproof and the enamel will not crack or peel. Put up on 25 yd. cards, four connected. . . . . E F G H  
\$1.75 \$1.50 \$1.25 \$1.25
- "ONEKO ENAMEL"** A green and white mottled waterproof line similar to the No. 321 quality, only with the greenish color instead of the dark, on cards 25 yds. each, four connected. . . . . E F G H  
\$1.75 \$1.50 \$1.25 \$1.00
- "VICTORY ENAMEL."** A brown and white cross thread line with a very smooth enamel surface, on 25 yd. cards, four connected. . . . . E F G H  
\$1.00 75c. 60c. 50c.
- "No. 324 CASTING."** This line we claim to be the strongest, smoothest bait casting line that angler ever used, round and perfect, dark brown in color, on 50 yd. spools, two connected (can furnish in pure white if desired), tested strength 30 pounds. . . . . \$1.50 for 50 yds.
- "TROJAN CASTING."** A mottled braided silk casting line, very smooth and pliable, brown color with a red coarse thread, on spools 25 yds. each, four connected. . . . . 60c. per spool
- "ONEKO CUTTYHUNK."** A fine quality natural color, hand laid reel line on 300 ft. spools . . . . . 12 15 18 21  
60c. 75c. 90c. \$1.00
- "TACONIC CUTTYHUNK."** Extra quality dark green linen casting line. The factory uses nothing but selected stock in this line and we guarantee every one to be free from all imperfections. Put up in two ways, 50 yd. spools two connected or on 200 yd. spools.
- |                 |        |        |        |        |        |        |

### HOOKS TO GUT.

- We mention the following three styles of trout, bass and lake trout hooks which are the most popular of the large assortment which we carry in this line. We, of course, have all the regular styles, but the following are special which we have introduced ourselves.
- "COSMOPOLITAN TROUT."** A light wire hook, bronze color, central draught in shape with a slight Kirby bend, tied on extra heavy single mist colored gut. . . . . Per dozen, 30c.
- "SILVER STEEL BASS."** A bright polished bass hook similar to the New York in shape, specially tempered and polished on heavy double mist colored gut. . . . . Per dozen, 40c.
- "PENNELL."** Mounted on bronze rust proof twisted wire. This is quite flexible, will not rust and is practically invisible when in the water. . . . . Per dozen, 75c.

### LEADERS.

- "No. 513."** Good grade Salmon leader, 3 yds., gauged and tested. . . . . Each \$1.00
- "No. 92."** Heavy weight bass leaders, 6 ft., with two extra loops. . . . . Each 50c.
- "No. 72."** Medium weight trout leader, 6 ft., with two extra loops. . . . . Each 25c.
- "No. 71½."** Same as No. 72, length 4 ft. . . . . Each 20c.
- "No. 141."** Heavy single bass leader, either black or mist color, 3 ft. . . . . Each 25c.
- "132 XL."** Fine quality drawn gut leader for Midge flies, 6 ft., with two extra loops. . . . . Each 45c.

Ohio Trap.

Dayton Gun Club.

DAYTON, O.—The members of the new Dayton Gun Club met at the Phillips House on April 29. The committee on grounds reported that they had secured an option on twelve acres, situated a few miles south of the city, on the east side of the Southern Ohio Traction line.

The club contemplates the erection of a \$3,000 club house equipped with all modern conveniences, and a house for the superintendent.

The financial committee will report at a meeting to be held on May 13. One member has contributed \$1,000, and others have pledged substantial amounts.

Berea Gun Club.

Berea, O., April 25.—The Berea Gun Club is an old one, having been formed in 1878. It holds its medal shoots on the first and third Mondays in each month, and practice shoots on the alternate Mondays. High gun was won by Inayh with 24. Cliff second with 23.

Club shoot, 25 targets: Inayh 24, Cliff 23, Bailey 20, Knowlton 20, A. J. Brown 19, Fiedler 18, H. T. Smith 17, Neubrand 17, Chamberlin 15, Byrd 8, R. Smith 4.

Rohrer's Island Gun Club, Dayton, O.

Dayton, O., April 27.—Rain, mud and lots of wind were the weather conditions which confronted the boys to-day and kept their scores below the usual mark. Joe Hohm, who surprised the members by winning the medal the week before, was again the victor with a score of 25 out of 32 shot at. He holds the championship and medal for another week. M. J. Schwind was second with 23 out of 28. There were no ties at this shoot, Hohm being the only one to break 25. The scores:

Hohm (32) 25, M. J. Schwind (28) 23, W. E. Kette (31) 21, P. Hanauer (29) 20, C. Hanauer (35) 20, H. Oswald (32) 19, J. L. Sapp (29) 17, C. F. Miller (26) 16, W. West (29) 16, J. Schearf (32) 14, C. Ballman (31) 13, J. Ballman (31) 12, A. Mack, Jr. (34) 5.

Akron Gun Club.

Akron O.—The recent shoot between five-man teams of Portage, Stark and Summit counties resulted in a tie between the Akron Gun Club and the Lakeside Gun Club, of Canton. On April 27 the teams met on the Akron's ground and shot the first of a series of three matches to decide the tie. The affair was made the occasion of a very enjoyable afternoon shoot, although the rain and high wind kept down the attendance as well as the scores. Lothamer, of Canton, and C. J. Schiltz, of New Berlin, were high, with an average of 85 per cent. The Akron team won, with a score of 204 to 195, Lucky and Bradley being high men, with 43 each.

The tie will be shot off at Canton on Memorial Day.

Team shoot, 50 targets per man:

Akron G. C.—Lucky 43, Bradley 43, J. K. W., 38, Wagoner 39, Metzler 41; total 204.

Canton G. C.—C. F. Schiltz 42, Lothamer 41, Haak 40, Young 37, Beccher 35; total 195.

Events:	1	2	3	4	5	6	7	Shot

Trap at Rylands.

Rylands, Ky.—A few members of the Cincinnati Gun Club and friends visited Rylands, Ky., on April 28, and indulged in an enjoyable live-bird shoot. The day was cloudy and rain fell at intervals; but, despite this drawback, all spent a pleasant day.

The birds were collected in the vicinity of Cincinnati, and were a good lot of strong fliers.

Dinner was served by Chef McComas, and it is sufficient to say that it closely approached perfection.

Two events were shot. Schuler won first in the 10-bird event with a straight score, and divided first with Rhoads and Boeh in the miss-and-out.

Event 1, 10 live birds, \$5 entrance, birds extra; money divided 50, 30 and 20:

Schuler	2212212222	10	Herman	2122012202	8
Pfeffer	0222222222	9	Boeh	0022012002	5
Rhoads	0222021212	8	Pohlar	0001012010	4
Gambell	2202220222	8	Werk	0200020122	5
Ahlrs	2202212022	8			

Event 2, miss-and-out, \$1 entrance, same division:

Schuler	222	3	Werk	20	1
Rhoads	222	3	Herman	20	1
Boeh	222	3	Pohlar	0	0
Gambell	20	1	Pfeffer	0	0
Ahlrs	20	1			

Cincinnati Gun Club.

Cincinnati, April 30.—About noon it clouded up, and by the time the shooting was well under way a strong wind was blowing from the left toward the traps. The light was poor. Several of the shooters dropped out, being unable to see the targets quickly enough. However, more straights were made than in any of the club events for some time.

Williams showed to-day in more like the form we expect of him. His '85 in the main event was good shooting, and at practice he did even better, breaking 49 out of 50.

About a dozen members will visit Dayton on May 10, and then will be selected the team which will make a strong effort to bring the Phellis cup back to this city.

Gambell, Randall, Harig, Norris and Barker did good squad work, breaking three 19s, one 20 and a 16, a total of 93 out of 100. The scores, gun contest: Faran (18) 100, Barker (14) 100, Williams (18) 100, Harig (40) 100, Steinman (22) 100, Linn (25) 100, Norris (30) 100, Pohlar (35) 100, Pfeiffer (40) 100, Bullerdick (30) 100, Straus (30) 100, H. A. Straus (32) 100, Kramer (40) 100, Block (18) 98, Randall (15) 96, Captain (25) 96, Peters (20) 95, Herman (30) 94, Le Compte 94, Jay Bee (25) 93, R. Trimble 93, Sundry (10) 77.

Springfield Gun Club.

Springfield, O.—At the club shoot on April 30, Watkins was high man for the day with 82 out of 100. Poole second with 78, and Henderson third with 76. In the shoot-off of the tie for the Young handicap medal, Henderson won. The Wilson trophy race was won by Wilson on a score of 20.

The club's tournament will be held on May 11 and 12.

Event No. 3, Young handicap medal, 25 targets, all 16yd. men: Poole 22, Henderson 22, Watkins 22, Wilson 21, Downs 20, Rankins 15.

Event No. 4, Wilson trophy, B medal, 25 targets: Wilson 20, Henderson 19, Poole 18, Rankins 18, Watkins 16.

BONASA.

New York Athletic Club.

TRAVERS ISLAND, N. Y., April 30.—There were five contestants for the gun trophy at the shoot of the New York Athletic Club to-day. Mr. Bechtel was the winner. The score and handicaps added, 50 targets, were as follows: Barnes (8) 44, Elias (14) 40, J. N. Borland (9) 46, M. G. Borland 34, Bechtel (9) 50.

Special cup, 25 targets, handicap allowance added: Barnes (4) 18, Gianinni (6) 18, J. N. Borland (4) 20, Hibbard 11, Bechtel (3) 19, W. G. Borland (4) 22, Elias (7) 25.

April cup, 25 targets: Barnes (4) 19, Bechtel (4) 24, Elias (7) 17, J. N. Borland (4) 20, W. G. Borland 19, Hebbard (4) 11. April cup final had five contestants as above, and was won by Mr. Bechtel.

Spécial cup, 25 targets: Barnes (4) 21, Bechtel (3) 22, Elias (7) 25, J. N. Borland (4) 11, W. G. Borland (4) 19. Mr. Elias was the winner.

Bristol Gun Club.

BRISTOL, Tenn., April 28.—The rain never let up falling, but the boys kept on shooting. S. G. Keller won medal for the week on his first round. Ninety-three is the lowest record for A. M. Hatcher this season. He shot three kinds of shells. Still he was head man for the evening.

A. M. Hatcher	22	25	22	24	93	V. Payne	20	18	19	20	77
S. G. Keller	25	22	24	21	92	W. H. Hicks	20	24	21	18	83

Interstate Association at Americus.

AMERICUS, Ga.—The tournament of the Interstate Association, held under the auspices of the Americus Gun Club, April 27 and 28, was attended by what might be called an ideal crowd. There were some thirty-five gunners lined up the first day, who were eager for the time for the first gun to be fired. These retained their enthusiasm for the two days. The scores made were not as high as expected, on account of a rather brisk wind, which continued for the entire time, and was very puzzling, to the amateurs especially. All things considered, no one who participated has any cause to complain as to his shooting. One thing particularly noticeable was the excellent way the crowd was handled by Mr. Elmer E. Shaner, the secretary-manager of the Interstate Association; and he made many friends during his visit here.

The famous Magnolia Dell, where the tournament was held, is one of nature's most inviting spots, and one had but to look around to see hundreds of these large magnolia trees in full bloom, while their fragrance permeated the atmosphere everywhere. The crowd each day partook of a delightful lunch at the noon hour, spread under the shade of these trees, and jolly good cheer prevailed throughout the entire time.

The ladies of the city each day honored the gunners with their presence, and were enthusiastic when good scores were made. Altogether it was one of the most delightful of tournaments, and all were sorry when the programme was finished.

High average among the manufacturers' agents was won by Mr. Chas. G. Spencer, with a score of 386 out of 400 shot at. Mr. H. B. Money was in second place with 383, and Mr. Walter Huff third with 377.

Among the amateurs, Mr. H. D. Freeman was high with a score of 365 out of 400 shot at. Mr. Frank Heidt was in second place, with 361, and Mr. J. M. Napier third with 358.

Mr. Spencer also won the silver loving cup, donated by Mr. H. S. McCleskey, proprietor of the Windsor Hotel, for the highest average made throughout the tournament.

Mr. W. E. Yates won the pair of hunting shoes for the longest run of straight breaks made by an amateur. Mr. Yates had a run of 48 straights.

The scores of both days are as follows:

First Day, April 27.

Events:	1	2	3	4	5	6	7	8	9	Shot

R. E. LEE.

## W. P. T. S. L. at Pittsburg.

PITTSBURG, Pa.—The two-day shoot of the Western Pennsylvania Trapshooters' League, held on the grounds of the Herron Hill Gun Club, Pittsburg, was the first of the League series for 1904. The programme was alike for each day, alternately 15 and 20 targets, entrance \$1.50 and \$2; \$5 added in each event. The Rose system, 5, 4, 3, and 2, and 6, 5, 4, 3 and 2, governed the division of the moneys.

On the first day high average was made by Mr. D. A. Upson, of Cleveland, O. He scored 160 out of 175. Mr. J. A. R. Elliott was second with 158. F. E. Mallory, Parkersburg, W. Va., was third with 157. On the second day Elliott led over Upson by one target, 157 to 156. Mr. E. W. Kelley was third with 154; fourth was a tie between Messrs. F. E. Mallory and Hickey. For the two days Upson was high with 316; Elliott one less, 315; Mallory, third, 310; Fleming, fourth, 304; Hickey, fifth, 301. The scores:

## First Day, April 26.

## Greenville Gun Club.

GREENVILLE, O., April 28.—Appended are the scores of our shoot of April 26 and 27. While the attendance was not as large as we expected owing to the weather, yet we had a very pleasant time. The different powder companies were represented by Messrs. Trimble, Kirby and Head, who did much to make the shoot a success:

## April 26, First Day

VOL. LXII.—No. 20.  
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

### A WILD GARDEN.

Nothing is more common than for people who have grounds about their homes to endeavor to surround themselves with the wild creatures of nature. The wish to do this is confined to no class, but is common to the rich and the poor, the rude and the cultivated. It may be undertaken by wholesale, or on the very smallest scale. It may be only a gourd hung up in a tree by a negro for the martins or the house wrens to nest in near his cabin in the South; or it may be the deer park, the pheasant runs, or the inclosed ponds where semi-domesticated wildfowl are bred on the great estate owned by some millionaire business man. There is no one but regards with interest the progress of a robin's nest built on the projecting shelf of a column of the piazza, or who is indifferent to the family life of the pair of chippies which have made their home in the vines that clamber up the porch. Men, women and children, from infancy to old age, are interested in and thoughtful for living things, and but little instruction is needed to teach the youngest member of the family that these wild things must not be disturbed or harmed; that he may look as much as he pleases but must never touch.

Many a country home, beautiful in itself, is made still more attractive by the throng of wild creatures about it, which feel themselves a part of the establishment—almost members of the family. Squirrels come to the house to be fed, sparrows, catbirds, scarlet tanagers and many other birds hop about on the piazza rail or floor, picking up food scattered there for them, in absolute fearlessness, provided members of the family only, their well-known friends, are present—a little shy if strangers are near. Meantime, at early morning and toward sunset, rabbits feed on the lawn, and quails scratch in the flower beds.

A love of plants seems to be less instinctive than that for animals; we all of us wish to see things that move. Yet multitudes of people are devoted to flowers and plants, but chiefly to those plants which are cultivated.

Why should not men and women who reside in the country, and within whose easy reach wild flowers bloom in great profusion, variety and beauty, ornament their places with these flowers and make friends of them as well as of the birds?

It is true that plants show themselves less adaptable than animals; that efforts must be made to secure for the transplanted violet or pyrola or orchid just the proper conditions of soil and shade and moisture suited to its continued life and growth. Yet the effort to do this is worth making, for, if the plant can once be established, it needs no further care, and remains a perpetual beauty and a continued encouragement to further efforts in wild flower culture. Those who live on farms, or who own large places where there is variety of soil and shade and moisture, may do much in this direction. A search of the neighborhood for beautiful plants adapted to the special conditions which the land offers is certain to be rewarded, and the heart of man or woman or child will be filled with joy and pride by successfully establishing a wild garden.

Many highly ornamental wild plants at once suggest themselves for such semi-domestication; the water lilies, white and yellow, for the water of ponds, sedges and wild rice for their borders; moccasin flowers for dry, shaded knolls; the wild honeysuckle and the Virginia creeper for climbers about the house and buildings—and a hundred other plants, all different in habit, and so requiring different treatment, but all beautiful, and all worth working over and succeeding with.

Ingenuity, perseverance and observation will be needed to discover the right plants, to transfer them successfully, and to make them grow; but in the work there will be found an ever-increasing interest, and in success an abundant reward.

### PORTABLE BOATS.

A LETTER published elsewhere expresses some interesting and valuable views about folding or portable boats which may be of benefit alike to user and manufacturer of these useful little craft.

Although there should be a great demand for a really good portable boat by sportsmen who pursue their bent either on fresh or salt water, comparatively few are in use. There are good reasons for this. The boat has not been brought to a sufficiently high state of perfection to be generally acceptable, and some of those now on the market are so complicated as to be more of a nuisance than a convenience. While it is obviously difficult to produce a portable boat adapted to all uses, still the boats could be modified to meet different requirements.

Of the boats of this character now to be had, all seem to have their weak points. In some the principle of construction appears faulty, but a general criticism is that material and workmanship are often unsatisfactory. These matters might easily be rectified, but the manufacturer, realizing that the masses demand an article cheap in price, too often turns out a product whose most important features are sacrificed for a few dollars.

Most purchasers do want a low priced article, but there are still many men who avoid the cheap and flimsy and desire something substantial and lasting, and who are willing to pay for what they get.

It is difficult to say just what a perfect folding boat should be, but it must combine simplicity—by which is meant ease in putting together and taking apart—with lightness, strength, and seaworthiness, and compactness when packed.

Attention to detail is what makes anything perfect; this applies particularly to the portable boat, for if not correct in every detail, it is almost useless. The boat should be constructed on good sound principles; its parts must be of the very best material, and finally, the most efficient workmanship should enter into its make-up. Considering the wide field there really is for portable boats, it seems remarkable that greater energy and more capital have not been expended in perfecting these craft.

Not only is the folding boat a necessity to the sportsman tourist, but to the cruising yachtsman who does his knocking about in a small craft, it would be indispensable. The average sportsman of to-day contents himself with a canoe—even though it is cumbersome to carry and does not answer his purpose—or builds a raft, rather than bother with a poor folding boat. The yachtsman is compelled to tow a heavy wooden dinghy that greatly retards his boat's speed in any weather and in rough water is a danger, because the folding boat is unreliable and unsatisfactory.

It is not until questions of this sort arise that we realize how little progress we have made in some directions, and how much certain things would add to our comfort, convenience, and safety.

### A MARINE MONSTER.

TWENTY or twenty-five years ago, with the recurrence of the heated period of each summer, the newspapers were accustomed to make jokes and to have comic articles about the sea serpent. The crop of jokes on this subject was perennial for many years.

More than twenty years ago FOREST AND STREAM published an illustrated article giving a number of the most authentic accounts of the viewing of certain large unknown marine animals, and pointed out that there was no reason for supposing that all such accounts were inventions or that these creatures were mythical, but that it was altogether probable that, inhabiting the depths of the sea, and perhaps often coming to its surface, were many great animals more or less serpent-like in form, and perhaps resembling some known reptiles of earlier geological times, whose descendants they might possibly be. Such reptiles living in the deep ocean, being destitute of any great amount of fat which should float them, and perhaps having solid and heavy bones, would on death at once, or soon, sink to the bottom, and the probability of their ever being washed upon the shore would be exceedingly remote. It was pointed out that the mythical kraken, so long derided as a creature of fancy, had been shown to have an existence by the discovery of a gigantic cuttlefish on the Newfoundland coast in 1872, and that later many of these animals have been found, so that

to-day most large museums possess specimens, or at least models made from the actual individuals. The probability of the existence of these animals—sea serpents, so-called—has thus long been recognized.

Recently some unknown serpentiform animals, described as more than twenty yards long and two or three yards in diameter, were seen by the commander of the French gunboat *Avalanche* in the Bay of Faitsi-long on the coast of Tonkin. They are said to have been gray in color, swimming with an undulatory movement in a vertical plane, and thus possessing a body not rigid like that of the whale, but flexible. The head appeared to be round, somewhat like that of a seal, but of course very much larger.

Lieut. Lagresille, when he first saw these animals from the deck of his vessel, endeavored to shoot them, but without success. Subsequently he pursued, but could not overtake them, and in each case, when alarmed, they disappeared under the water. From the description given by the observer, Prof. E. G. Racovitz, Assistant Director of the Arago Laboratory in Paris, has given this beast a Latin name, calling it *Megophias megophias*.

The describer points out that the securing of further knowledge about these monsters is very desirable, but that it is not likely that they can be captured by ordinary means, such as shooting, since they will probably sink at once. What would be much more useful would be to approach the animal as nearly as possible and make photographs and sketches. If one could be found in a shallow harbor, and killed there, it might be secured.

From what is told by the officers of the *Avalanche*, it is supposed that these animals are not uncommon, or perhaps are even abundant, on the coast of Tonkin, and if this is true and a knowledge of the best method of acquiring information about them can be spread among vessels of the white men traversing these waters, we may hope some time to learn more about this particular form of marine monster.

### HENRY M. STANLEY.

THE death of Henry M. Stanley removes one of the most striking figures of the explorers of the day, and the man who of all others has done the most toward opening up to knowledge, settlement, improvement and civilization that tremendous land which he first named the Dark Continent. From Bruce down to Livingstone and Stanley the list of African explorers is a long one, but none has stood higher, and none has accomplished more, than he who has just died.

Henry M. Stanley was eminently a self-made man, reared in a poorhouse and beginning life as a cabin boy. Later he was adopted by a New Orleans merchant, whose name he took. He served in the Confederate Army, and after the war went into newspaper work. In 1867 he was engaged in reporting two Indian campaigns in Kansas, Nebraska and Colorado, then a part of the far west and almost without inhabitants, for at that time the population of Colorado was 35,000 and Nebraska 122,000, and Kansas 350,000. In 1868 he was working for the New York Herald, and was sent to Abyssinia with the British expedition. In 1869 Mr. Bennett sent him to Africa to find David Livingstone, and it was his success in this enterprise which made him famous. Subsequent years were spent in exploration in Africa, which increased his reputation as an explorer.

He wrote several important books of travel and exploration, and finally returned to England, married, and was elected to Parliament. He was 63 years old when he died.

In a New York paper, usually entirely reliable, there appeared a couple of weeks ago a dispatch from Phœnicia, New York, declaring that the wild passenger pigeons, formerly so abundant in Sullivan and Ulster counties, had returned there and were nesting in great numbers. It added that about thirty years ago the wild pigeons were abundant there, and then, for some unexplained reason, disappeared, and have just returned from Canada.

The dispatch bore some evidence of being an invention made for sale, but in order to settle the question, a number of reliable persons who reside in Phœnicia, Hardenburg, Denning, and other points in Sullivan and Ulster counties, were communicated with. All replied that there have been no pigeons seen in that region for about thirty years, and that there are none this season.

# THE SPORTSMAN TOURIST

## Floating Down the Mississippi.

### V.—Reelfoot Lake, Concluded.

THERE are some pretty little things in the way of law-making which appeal to the lovers of the round-about and the indirect. For instance, who would suspect a game law as a means to perfect one's title to property in dispute? The law of 1901 for Tennessee (Section 1, Chapter 91, Acts 1901) says a man must have the written permission of the owner of the land if he wishes to hunt thereon. Suppose I should claim a sandbar, and all hunters who came along, or even a large proportion of them, came to me and got my written permission to hunt thereon—I take the list of names of persons to whom I've issued permissions and shake them at the judge trying me for ordering a man off a public sandbar, using force, etc., and say: "It's mine; don't everybody say so, admit it, and here are these men—some at present in court—to testify that they admit I own the sandbar!" A mere citizen, liable to be a jurymen, sees the force of such an argument. Frank Sparks, at Tiptonville, said that there was something in that written permission business which smelled of an old man Harris notion.

Judge Harris told me that he would give anyone permission to hunt on Reelfoot Lake when they came to him. He also said he owned all the lake, and its shores—that it was his, and he'd fight for it in court. But Sparks says that he owns land cornering in the lake, and that if anyone wants to go on the lake they can do so without anyone's permission. In the drainage case, because of that Stone's Ferry, which, in the old days, was operated to carry folks to the county seat of Obion county, and to the unflooded hills, Judge Swiggart decided that it is navigable, "in a technical sense." Being navigable, it's public, perforce—if the Tennessee Supreme Court says so in the suit which neither side is in a hurry to bring to an issue, but which will be tried some time—perhaps this winter.

Harris owns a lot of claims covering parts of the lake. He owns a good deal of the land around it. He has the deeds to show for it, and the quit claims. Ranged against him are the "always hunted there," some claims or titles he could not purchase—so it is said—the fact of launches and ferries on the lake—a mail route across it during high water, when the road can't be followed with a raft, pike pole—some scores of fishermen, a lot of hunters, and public sentiment. Harris claims two objects in getting possession of the lake. He wants to control the output, and eventually to make it a club's preserve. Seventy thousand dollars' worth of fish and the best duck shooting in the Mississippi Valley are worth contending for; any sportsman or commercial mind will admit that. Harris does not shoot or fish, but, as remarked, takes delight in a camera, and some of the best photographs of Reelfoot so far taken he made. Some are shown with these articles.

The people who are opposing Harris are ranked, so to speak, behind one John Shaw, who is buying fish under bond at Sandberg, near Burdick's dock. One hears that these men get about the same amount of fish and game. The rivalry is keen, but the prices paid are about the same by each. The markets are Cairo, St. Louis, Memphis, etc., and the wholesale rates at these markets are about three times as much as the above prices. If \$70,000 is the value of the year's catch, at four cents a pound (too much), 1,750,000 pounds is the total catch, or seventy pounds to the acre—25,000 acres. I asked for an estimate by Burdick, but did not get it.

The fishermen claim that they make "lots of money—more than some of those white-collar fellows in town." Storekeepers at Tiptonville said that when fishermen came to town they made good purchases, about like sixty-acre cotton farmers, which indicates between \$700 and \$2,000 a year. But the farmers are much closer fished than the fishermen, so it is likely the fishermen do not run much over \$2 a day, if they do as much. Their "rag houses," or tents, and their looks do not indicate even this much. Stakes at the card tables go \$100 in sight at once sometimes, and only the best brands of whiskey are used, as a general rule "to keep off the chills." A few of them have farms back in the hills, to which they retreat at times, but others live the year around on the borders of the lake, or on one or the other islands; cultivating a little patch of a garden, raising some cane-rooters for pork, keeping a cow or two for milk and butter, and soda biscuit. The stock is put on a raft when high water comes, or else ferried to the hills. The islands were under water so long this summer that the cane was killed.

In summer, a thick green moss, almost impenetrable to boats, covers much of the surface near the shore or in shallows, and is thick enough to prevent skiff navigation in some of the pockets. The water grows so warm that the fish are driven to the deepest waters and even there the nets "burn," as in the big river. In spite of the plentiful use of tar, nets are destroyed, even if used only during the cold months. Pole and hand-lines are used during the summer, and live bait or trolls

bring in fine bass, up to seven or more pounds, it is said. "It is said" must be used by the note-book maker in regard to what he hears concerning Reelfoot Lake. I was told that "we make \$4 or \$5 a day all the year around, and it isn't nothing to have a \$25 haul at a running of the nets." Harris warned me not to believe all that I heard about the large number of fishermen on the lake, and their great wages. "There are 500 of us, and we've got \$20,000 worth of nets in this lake," they told me. These figures meant \$40 per man, of four hoop nets each, at \$10 a piece (a liberal value). Some fishermen run forty to eighty nets—\$400 to \$800 in tackle—so it is said. Ten or twelve nets are considered enough on the river. Figured by the forty nets would make the number of fishermen fifty. Harris said there were not over sixty two or three years ago, when his father counted them up. A hundred receiving \$500 to \$700 apiece per year would use up the \$50,000 to \$70,000 worth of fish the lake probably yields.

They use a trammel net on the lake. From a single line at the surface are hung three nets, two of them eight-inch mesh and hanging from three to nine feet deep, and between them an inch and a half mesh net a third deeper, but fastened to the bottom line. The fish, scared in by the splashing of the fishermen driving toward the net at night, dart through the eight-inch

JAMES C. HARRIS.

mesh, catch up the little mesh net and pass on out through an eight-inch mesh on the other side. A twist then leaves the fish in a pocket, secure till the drawing. Two places—Blue Basin is one—admit of 600 or 800-yard seines. The seine is run down one side of the long open among the dead stubs and up on the other. Where the ends come opposite is a box of netting. The fish are crowded in toward this box, and when all are in, the front of the box is raised and the fish lifted out. Burdick runs the seines himself, and got \$1,000 or thereabout at one haul of spoonbills.

Hoop nets—a long, round bag, kept open with hickory hoops, with "throats" or funnels centering toward the bottom of the pointed bag—are employed. They are used winged in the lake, sometimes with a hoop net at each end of the wing, so that whichever way the fish runs along the fence it will go down the succession of funnels and into the fisherman's pocket at last.

I found a Lake Huron fisherman setting up a "submarine net" on the Reelfoot shore at the end of the road from Tiptonville one day. It was an eight-foot covered net box, led to by two long wings. For a distance out on these wings the top and bottom are netted as the apex of a letter A. Two cross-bars, each broken in two at the middle and sloped toward the box at the apex. A fish came to either leg of the A and ran to the break in the cross-bar into clear water. Going ahead, it came to another section of the leg, and following this, went back into the angle caused by the broken cross-bar and a leg, or else on into the apex of the A, beyond which is the cubical box, approached by a funnel, opening in the center of the eight-foot cube box. The fisherman said the cross-bars are called hearts. A fence of netting leads to the break in the lower cross-bar on a line bisecting the angle of the A, so a new and more deadly contrivance has appeared in Reelfoot waters. A Reelfoot fisherman said: "I'm going

to keep an eye on that net, and if it works I'll have one."

The Huron man said that if the Reelfoot Lake fishermen were any good they'd have the lake fished clean in three months, that the hoop nets were used when he was a boy on the lake, and that two men right there had taken \$1.60 worth of fish in two days, of which half went to Burdick for furnishing the twine of which the nets were made, leaving twenty cents a day to the men for their work. It was a bad fall for the fishermen, however, and until cold weather drove the fish out of deep water and started them to moving around, it would not begin to be good fishing, and most fishermen didn't have their nets in. The \$1.60 for two days by two men did not tally by many dollars with another man's statement that "of course we're only making a couple of dollars a day now."

"There are no twine men on the lake here," the fisherman from Lake Huron said. "They don't know how to make a net. When they put this one in they'll see a difference in catching fish. But I'm going right back to Huron, that's where I'm going, just as soon as I get this set up for my brother."

Uncle Bug Spain is eighty-two years old, and still sets his hoop nets, after fifty years on the Reelfoot. Old Man Standick is named as the best trotter—trot-line man—and John Fry and Dick Harper had to hire five or six negroes to dress the catch they made, trammeling one night. Burdick does the seining himself.

It is unnecessary to tell any of the fish stories, but one who sees black bass swirl out from under the big lily pads every rod or two as he paddles along need not be told how a man could whale them out there in the good old fashions known to fly and live-bait casters. I saw fish rising by the score among the gray stubs, though it was frosty times. For the man who wants real excitement with a light rod, this lake and its mates offer a field for nerve. Poets, however, would better keep away, else they never will cease to shudder at the memory of fishing in a cemetery.

At Tiptonville I met for the first time a professional hunter—a man who makes a living business of supplying game to the markets. There were several of these men—Frank Sparks being one of them. He had killed "feathers" as well as game. He runs a hotel at Tiptonville now, and one need not talk to him long on his favorite subject of hunting to learn that here is a man thoroughly in love with shooting, not only as a business but as a sport as well. "I'm a pot hunter," he said fairly and squarely and convincingly. "I left a good business to become one. I like to hunt. They tell you that a pot hunter bunches his game in the water and then kills them—sneaks through the brush and gathers them in sitting. It isn't so. I won't shoot a duck in that way. It wouldn't pay. I take them as they come in over the decoys, their wings whistling—and so does every other market hunter who makes his living so. I'll tell you one thing—a market hunter knows more about ducks than sportsmen. How many sportsmen can call a duck? I've seen a market shooter who was a poor shot miss a mallard drake six times with his shotgun, and then call the bird back and kill him. I'll tell you what you want to do. If you want to save the game fowl, you abolish the use of the duck call—prohibit its sale—and compel the hunter to sit over their decoys in silence. There isn't a pot-hunter but would rather go back to an old single-barreled muzzleloader than give up his call."

"Another thing. Take our game law as it stands now. All kinds of ducks except woodducks are protected from April 15 to October 1. A man can go out on Reelfoot, however, and kill woodducks after August 1. Think of that! 'Woodduck!' Can you tell what kind of birds are coming down around a hunter half a mile away? It makes an open season on Reelfoot Lake from August 1 till April 15. Here's another thing. Our duck season opens on October 1—nice warm weather, with the lake as smooth as glass and any quantity of cormorants—water turkeys—flying round. About the fifteenth in comes the first flight of mallards, say. They don't reach the water before some one is coming in on them with a sneak-box. Scared, the ducks hurry away south unrested. And so with the next flight—all hurried past by fear. What's the result? When the main flight comes late in October they go right past. Now, let's have the law November 15 as the opening day. For weeks the ducks have been coming in. They've hit the water unshot at. They've had time to preen their feathers. They've had a good feed. They've grown fat. They've grown rested. They are stool for every flock that comes within five miles, and perhaps the whole flight is laying around here when the open season begins. Then you'd have shooting. When ducks get used to laying around a place, they're a lot harder to drive away than if they come in strangers and meet a hail of shot."

Sparks is a convincing talker, and a direct one. He approves the law forbidding night shooting—a most destructive way of getting ducks and geese is fire-hunting. He swings as he walks, and long practice of hunting has given him a seeing eye. But the three market

hunters I saw did not have pleasant eyes, too cold and keen for that. Neither was their gait lovely. Perhaps I imagine, but what I saw was a swing, almost soldier-like, but chillingly precise. Sparks was building a 25ft. gasoline launch and had an eight-horse-power engine for it—an automobile outfit. But two young men—say twenty-five years old—were there to begin hunting. One was caulking up a sneak-boat, putting a little launch—gasoline—into shape for towing this boat up the river, that he might float down, and otherwise preparing for the season. One day he went to Reelfoot and got fifty-three ducks. He was going to hunt the river mostly, however. The other man was from Iowa. He said in my hearing that he didn't have any professional license, that he had a non-resident's license, however, and that he was going to hunt on Reelfoot, and take his ducks right to Burdick. He claimed to have seen Richard D'Ailly, Lake county's warden, and been told he could sell his ducks so.

Here is another phase in the contest for the possession of Reelfoot Lake. D'Ailly is one of the nicest men any one can care for. He knows as much about the nature of Mississippi Valley as years of study can give. He has bird skins, butterflies, mineral specimens, books, notes, and the greatest of interest in natural history—and his wife is equally interested in these subjects. He lives half a mile from Reelfoot, two miles from Tiptonville, on a place where he proposes to raise blue ribbon poultry, study botany and otherwise enjoy the rest he has earned in a life spent as an engineer. Coahoma knows him.

When D'Ailly was appointed warden, Frank Sparks had been suggested for that office. A petition was circulated around for names to endorse his appoint-

over my canvas bag hammock, and so close myself in. In the morning, a thin haze was over all—a very thin mist, and just right for pictures, and I took some then.

Fishermen, hunters, note makers, photographers, history gleaners or poets, all find Reelfoot a curious and remarkable place. "You're kind of queer," a man told me when I said: "I couldn't stand a place like that."

#### Once More Afloat.

I pulled out of Tiptonville on the afternoon of Friday, November 13, a combination to make a ghost laugh. Some other things were in the combination—some disappointment, some homesickness, some dislike of the hardships to come, and a wide river over which a stormy haze threatened. Up in Putney Bend Jack Stevenson and I had stopped over night with a big medicine and stereopticon boat run by James Pool and S. M. Sugg. We were congenial enough, and it was suggested we drop down the river together after I had seen Reelfoot Lake. Postal cards, addressed one to Tiptonville, one to Hickman, were exchanged, and at Tiptonville I heard the boat would pass that place about November 8. I waited till the 13th, and then, not hearing more, went on alone.

After town life in a boarding-house, and new-found friends and indoors, the river causes in me a bit of heart sinking, but there are voices in sandbars and caving banks and wide coiling waters which grow louder and louder—it was well I started on when I did, lest, perhaps, I had been obliged to admit myself, a river man, unable to resist the call of the sirens of the Mississippi. "He can't get off the river!" is said of some men abundantly able to live in town on their savings or their wages. Everywhere along the river, so far as I have seen it, and according to river wanderers, all along it, are people unable to cope with the things that draw them back to the uneasy life upon waters that, to them, are completely enchanting.

The wild birds were on their way south. Some flocks of ducks appeared in the distance on the water, mere black bobbing specks, for the most part, and yet with that little thrill in them which one close to nature feels, though he cannot explain why—the difference between a live thing and a stick of drift which is noted when the object is too far off to see the head or other visible sign of life. Overhead, so high as to be scarcely distinguishable, was that sight dear to men of the gun, wild geese in wide Vs. Now and then a little bunch of ducks in bullet flight came past in their ricochet jumps from the north. As a spectacle to make one catch his breath, nothing that flies is quite so impressive to me as these straight-flying birds shooting past—winged projectiles. Cut down by a charge of shot in mid-air, they tumble end over end, still like bullets. To one who has never hunted ducks in a duck country, but with only wood birds in his record, those hard, swift flyers on whose feathers the shot rattle, were new and thrilling game.

Fresh from town, there is a side of nature on the river which is more impressive than it is a few days later. This is the quiet—a blessed silence, which is interrupted—if at all—chiefly by wild things—geese or ducks or a crippled cotton gin that is shutting down. On the day I left Tiptonville, the water was unruffled by wind. I ran on till dusk—a caving bank on one side and a wide, inhospitable sandbar on the other, suddenly became ominous. Where could I tie up for the night?

It is easy for one lost in contemplating the nature of a river without regard to personal application, to pass the last good landing, and, in the night mist, be lost and without a place to sleep. It was almost dark when, despairing of a better place, I tied in at the head of a bar, where the mud was pretty deep. A couple of chunks of wood made a place to step out; then a hundred yards away I said "How-do" to a shack, and learned that I could camp without being molested. I stretched my canvas hammock in the boat, drew my painted cover over all, and went to sleep. It was a bad place, exposed to the wind, with a mud landing, and not much chance to fix things over if anything happened. I was fortunate, and nothing happened.

RAYMOND S. SPEARS.

[TO BE CONTINUED.]

## Glimpses of the Past.

THE few remaining settlers of northern Iowa who came to this beautiful prairie region far back in the early fifties, recall with the deepest pleasure the days that have gone, although these days were often fraught with hardships and deprivation that to-day but few can realize. Everywhere around them then were the beauties of nature, for the hand of man had not yet defaced the loveliness of the landscape.

The years went swiftly by and brought wondrous changes. Could the old trappers and hunters of this region then have fallen into a "Rip Van Winkle sleep" and awakened again in the same region to-day, no amount of evidence would convince them that it is the same country they knew in the long ago. In no time or country in the world have such wondrous changes taken place in so short a space of time. The old has given place to the new, and change, change, is ever the order of being.

Only occasionally here and there do the few old settlers who still remain see a reminder of the days they love so well to recall. Last summer was exceptionally rainy and wet throughout Iowa, and this condition brought vividly to mind the terrific rain and thunder storms of the times back in the fifties and early sixties.

Along portions of the railroad tracks that were built across the prairies long years ago, and by the sides of the roads which the pioneers laid out across the trackless prairies of the early days, and on the rare patches and tracts of virgin prairie land which at long intervals gladden the eye to-day, was a dense growth of blue-point grass five to six feet in height, and besprinkled everywhere with the beautiful wild flowers that in days gone by grew in such countless millions here. The stately gum weed, or compass plant, with the edges of its coarse serrated leaves ever pointing northward and southward, is still seen in numbers among the old friends of the early days. The red lily is still seen, and most conspicuous in the lower lands may be observed in scattered groups beautiful pendant tiger lilies, which none who have seen them in their wild state will ever forget.

Not long ago a friend named Wilcox, himself an early pioneer of northern Iowa of the days of '51 or '52, while breaking up an old and extensive peat marsh near Thornton, in the northern part of the State, brought to light the skull and other bones of a horse, with the deeply rusted remains of an ancient iron bridle bit in its mouth, and close beside it, and apparently lying partly under the horse, was the skeleton of a man; all these relics owing their preservation to the chemical qualities of the peat in which they lay. One hand of the man lay spread out, and left a singularly distinct impression in the peaty soil.

These may be the remains of an Indian and his wiry pony, or may represent the remains of a white hunter such as roamed the prairies in those early days, and who perhaps met his death here at the hands of the ever-watchful Sioux, who in early times claimed this region as their home and their hunting ground. In any event, this was the last resting place of an early hunter, whether white or red, who faded away with the departing glory of the early days. Here was revealed a chapter in a life's history, which doubtless few, even in that early day, knew of.

Near and around these skeletons were plowed up the remains of perhaps fifty buffalo, the skulls and wrinkled horns being still in a fair state of preservation. Their bones were in fact so abundant as at times seriously to interfere with the running of the breaking plow.

A very early pioneer who settled in this immediate locality somewhere in the later forties or early fifties, told my friend Wilcox at the time that when he first settled here the buffalo were abundant, and during the late fall at evening they would come in droves, bellowing, to drink at this slough, which was then a fair sized lake, and as the ice had formed along the edge, they would crowd each other over and into the water, and some would almost invariably be drowned. This, he stated, accounted for the finding of so many buffalo skeletons to-day in plowing up the old lake bed.

The account recalls sad recollections of the wanton and criminal destruction by the white hunter of untold millions of one of the noblest wild animals the American continent ever knew. CLEMENT L. WEBSTER, M. Sc.

CHARLES CITY, IOWA.

THE WILD TIGER LILY OF THE PRAIRIES.  
From life, by Oscar D. Turner.

ment. Sparks opposed the Harris claim to Reelfoot Lake. A D'Ailly petition was circulated, and Sparks received a letter from Game Warden Acklen saying that the D'Ailly petition had reached the game warden's office first and had been acted on when the Sparks petition arrived—though it was sent with a special delivery stamp on it, and started the day before the Harris petition did—so one hears.

"If a man violates the law in Obion county he has to look out. The game warden has settled some of the men there—many fined and six or eight cases coming up next court sitting," Sparks remarked. There never was a game warden who gave complete satisfaction to everyone.

It is difficult to come to any conclusion in regard to any stated feature of Reelfoot Lake. The Harris estate is reaching out for control of Reelfoot Lake, and the pot hunters and sportsmen are ranged together against this project. The pot hunter, however, has not been above getting permission to hunt from an estate, if by so doing he can sell his game to a market dealer without a license required by law. A professional hunter, in addition to paying \$25, must furnish bond of \$200 not to violate the provisions of the Tennessee law. The bond feature drew down the face of the Iowa young man. For many years he had shot on Reelfoot for market, and coming back he found things in a mess—from his point of view—and so it is from almost any other viewpoint.

This much is certain: The sportsman who is a non-resident of Tennessee and does not pay \$100 taxes in that State must put up for a license. My State, New York, does not charge a non-resident for hunting therein, unless a New Yorker has to pay in the non-resident's State. The Tennessee law is the same, only one must have a license in Tennessee, so I got mine easy—some swearing to be done before a notary, and some small office fees to pay were necessary. The would-be visiting sportsman can hear from Game Warden Acklen at Nashville in regard to these things.

I passed one night on Reelfoot Lake. I swung my hammock between two cypress trees, where I could reach out and drop a splinter into the water. It was bright, October moonlight, and my cover thrown back so that I could look out on the water—and at those desolate stubs—I watched the placid surface and grew chilled by the things I saw. It was an awful view, and left an impression which cannot be quickly eradicated. A few rods away was Webster's tent; snuffling round were some of his "cane-rooters," now and then one of his dogs would whine, and perhaps a bird swim past in the water or a flock whistle by overhead. But these signs of life but accentuated the feeling the dead trees standing in the water spread all around. After a long look at the scene—during which the moon changed from southeast to southwest, I was glad to turn down the square of canvas which hangs, A-fashion,

THE BUFFALO OF THE OLDEN DAYS.—Drawn by Oscar D. Turner.

## Natural History.

### Feeding the Snakes in the New York Zoological Gardens.

(Continued from page 374.)

After the snake has learned to eat, his appetite is almost unsatiable. He seems to be hungry all the time, and when he gets food devours it in any quantity that is given him.

"It is not every snake, however," said Curator Ditmars, "that has to be forcibly fed. Very often snakes take easily to food. We first offer them a plucked chicken, and they usually do not refuse the tempting morsel. After that we begin feeding them on rabbits, rats, guinea pigs and the like. The popular idea that all snakes must have living prey is erroneous. Captive snakes take readily to dead food."

"Some persons imagine that our reptile house is a chamber of horrors, and that live birds and other living things are made food for snakes. We don't give live creatures to snakes, for the reason that it would cause great commotion in the cage. As soon as something living—say a chicken or a mouse—is put in a cage full of snakes they all strike at it, and there starts a fight. I have seen at some zoological gardens some very disastrous combats just from this cause."

"It is perfectly marvelous how some of those big snakes are capable of swallowing. A good-sized boa can easily accommodate an antelope, deer or kangaroo. The jaws of the snakes are disarticulated after a fashion, and this allows great stretching of the muscular tissue. Snakes, of course, do not chew their food. Everything is eaten whole."

"In swallowing an antelope, the head goes first. The forelegs are folded neatly down to the side. When, with a sort of gentle, rhythmic motion, the animal begins to disappear. I believe the jaws and throat of one of the largest snakes could easily get around a young hippopotamus."

"The snake is provided with a very remarkable arrangement of teeth. The lower jaw is divided in two parts, and these work independently, the teeth pulling the food in like a machine. You have seen how the head of bearded wheat will work itself up one's sleeves? Well, the progress of food down a snake's throat is on the same order."

"The smaller snakes at the reptile house are fed on mice, sparrows, bugs and worms. We have little difficulty in getting these snakes to eat. It is generally with the big fellows that trouble arises."

Foremost among the snakes at the Zoo requiring food of its own kind is the monster king cobra. Once a week a five or six-foot blacksnake is procured, and, after being subjected to a peculiar process, is fed to the cobra. The cobra will eat only large snakes, and the larger they are the better she likes them. No blacksnakes large enough to suit the appetite of her imperial highness has ever been found. If she had her own way about things every snake in the house, including several of the boa constrictors, would long ago have wandered down the throat of this tremendous snake. Already her appetite has made blacksnakes scarce in the park, and when it is impossible to catch one of these "racers" it is necessary to buy one in the open market, unless, as is often the case, some admirer of the cobra, who knows her tastes, presents her with a meal in the shape of a blacksnake.

So fastidious is the appetite of the cobra that if the blacksnake is not to her liking as far as size is concerned, she will not touch it. It is here that the peculiar process referred to takes place. This consists in making the snake think that she is getting more than she really is. After the blacksnake intended for her meal is killed, a dozen or more frogs are killed and stuffed into the dead snake's throat so as to make the body bulge out in all directions and appear large. In this state the blacksnake looks as if it were a huge stuffed stocking, and is of a girth which seems as if it were several times the diameter of the throat of the reptile for which it is intended. The stuffing of the blacksnake is done for two reasons. In the first place, even the largest sized blacksnake is not large enough in its natural state to tempt the cobra to eat, and secondly, by making a frog-pie out of the blacksnake, the frogs, which otherwise the cobra would disdain, are gotten into the reptile to furnish nourishment, whether the cobra likes it or not.

"The snakes, at all times," said Mr. Ditmars, "evinces eccentric wants which must be met by equally eccentric attention. Without ingenious and sympathetic keepers, a collection of reptiles would quickly starve, even though the cages were plentifully provided with the necessary foods."

"Unlike the animals which are fed daily, the reptiles receive their food at intervals ranging from a day or two to a month, according to the species or the disposition of the specimen. If a reptile is very active it must be fed frequently."

Turtles and lizards, which are continually moving about, require feeding every other day. The big constricting snakes, which are coiled in the same position for a week at a time, seldom take food more frequently than twice a month. As a rule the smaller snakes are fed every ten days.

"Nearly all the big snakes have the habit of fasting for indefinite periods. After feeding regularly for two or three months a python will steadily decline food for about the same period, after which, as a rule, he again feeds voraciously."

"During these long fasting spells the keepers follow their charges' actions with close attention, for it is at these times that the dreaded canker may form in the serpent's mouth, and unless immediately treated with antiseptic washes it becomes dangerous and often fatal. A three months' fast with a healthy snake never worries the keeper, for the reptile usually begins feeding again without the slightest signs of emaciation."

"The reptile house bill of fare is elaborate in its composition. Rabbits, pigeons and chickens furnish nourishment for the constrictors, while rats, mice and sparrows are provided for the smaller snakes. The lizards demand large quantities of meal worms, which are varied by flies

caught in the warm months in a series of fly traps. Large quantities of fish go to the alligators and water snakes, while vegetables of many kinds form the food of the tortoises and herbivorous lizards. With the larger snakes the chickens and rabbits are killed and presented to the reptiles individually. This brings about an even distribution of the food and prevents trouble."

"If a live rabbit or chicken were cast into the cage containing six or eight big snakes trouble would be inevitable. Several of the reptiles would seize the creature at the same time, and in the constriction that followed all would become entangled in such knots that the smaller snakes would fare badly. If, after the prey has been introduced and a large snake begins to swallow it, a smaller snake is persistent in its hold on the prey, the small snake may find a resting place in the elastic interior of its cage mate."

"The feeding of a cage of pythons is an operation which requires skill and time. The first thing done is to separate the big fellows, which lie socially coiled in a great mass."

"The keeper then hands them their chickens and rabbits, one by one, keeping many of the snakes covered with blankets to prevent fighting."

"The most difficult snakes to maintain successfully are the poisonous snakes. So nervous that the slightest movement causes them to spring into a coil of defense, these reptiles in many instances deliberately starve themselves to death."

"In consequence of their nervousness, the poisonous snakes are fed at night, when the reptile house is absolutely quiet. It is the viperine snakes that possess this timid disposition. The cobras and their allies, although on the alert for trouble, feed regularly and freely."

"Obstinate snakes are very often coaxed into eating by specially prepared food. A brace of tender young squabs, fattened for the occasion, may be provided."

"At times large and valuable specimens arrive from foreign climes with digestive dispositions much out of gear. With the characteristic eccentricity of a reptile, such snakes are usually voracious feeders."

"The condition of their internal organs is soon apparent and the utmost care is at once needed. The diet is immediately cut down to far below the normal and the feeding resolves itself into a system which continues for months after."

"Humorous incidents are many and varied in the work of coaxing newly arrived turtles and lizards to take their food. A huge alligator terrapin fasted for many weeks in the reptile house to the worry of the keepers. Being a pugnacious brute, it was induced to eat by strategy. It was tapped vigorously on the nose with a stick and its jaws flew open. Thereupon a fish was inserted in its mouth. Each round of teasing resulted in the creature's taking a substantial bite, which was involuntarily swallowed. The treatment lasted for weeks, when the turtle was finally induced to feed of its own accord. Much the same maneuvering is employed in the case of stubborn crocodiles and alligators."

"When the five alligators which now occupy the saurian tank in the reptile house arrived at the zoological park, it was determined to introduce a novelty in the way of feeding these creatures. In many institutions the food for the 'gators is simply thrown into the tank, and the more vigorous individuals help themselves without regard to their smaller associates. This was prohibited from the start. No 'gator was to receive a morsel of food unless it was taken from the keeper's hand."

"For weeks the reptiles swam about warily and watched with hungry eyes all sorts of tempting food held at the side of the tank. Big Mose was the first to gain courage. Swimming up to keeper Snyder it opened its huge jaws appealingly and a chicken settled between them. There was a crunching of bones, the raising of the broad snout a yard or more above the water, the blinking of a yellow eye and the fowl was gone."

"Mose repeated the operation several times and swam away satisfied. Gradually its timid mates followed the example, and now the 'gators line up at feeding time with gaping jaws, and await the distribution of fowls or fish, as the diet may be."

### Short Talks on Taxidermy.

#### III.—Skinning the Bird.—(Concluded.)

THROW the skin on the table with the head away from you and the cut down. You will see the wings and the legs protruding. These must be cleaned. Pull out first one wing and push the skin as far down toward the wing joint as you conveniently can. Scrape and cut away all the flesh that you can see, and cut off the humerus, or upper arm bone, at the joint where it meets the radius and ulna, the two parallel bones of the middle wing. Some authorities declare that the secondary feathers, which are somewhat firmly attached to one of these bones, should never be disturbed. A more common practice—with small birds at least—is to run the thumb nail along the bone toward the bend of the wing—or wrist—and to free all these feathers, and then to cut away the small strings of muscle which lie between the two bones. This is to be done on either side. The legs are then pulled out, and the skin pressed down to the tibio-tarsal joint, and all the flesh cut away on both.

Now take a bit of cotton and form a pellet large enough to fill the orbit, and place such a pellet in each eye socket. If the bird is larger than a robin, wrap a shred of cotton about each one of the leg bones. Take your skin by the tail and the tips of the wings, hold it over the poison box, and dust the dry arsenic on it with a liberal hand, seeing that the poison touches every part of the flesh side of the skin, including especially the head, wings, legs and tail. Then shake off the loose arsenic into the box.

Throw your skin on the table, as before, and taking the skull in your forceps, push it back through the neck, just reversing what you did when you were skinning the bird. Do it slowly, and see that the head is properly directed, so that the bill will not catch anywhere in the skin. In a moment you will see the skin begin to turn itself right side out. As soon as the bill shows, take hold of this with your left hand, and gently work the skin back over the head. In all cases be careful not to drag or pull the

skin. It is easy to stretch it, but very hard to get it back again after it has been stretched. When the skin is right side out take each wing, give it a gentle pull and shake, and each leg the same, and you will see lying before you the bird's skin, which now requires only to be filled with cotton and made up.

Take each wing by the first joint, that is, the bend, which corresponds to the human wrist, lift it up a little, and pass your finger along under it, so as to straighten out the secondaries and wing coverts, that they may lie smoothly and substantially in their natural relation to the bones of the wing.

Some taxidermists, before the skin is turned back again, catch up with a needle and thread the skin of the back, just opposite the wing on each side, and draw these sides together. In the reversed skin, on either side of the back, is seen a line running from the neck to the tail, where the feathers grow, and if these two lines are drawn together, say within half an inch of each other, for a bird the size of a bluebird, it gives a little roundness and fullness to the back, and perhaps renders the skin a little easier to make up; that is to say, the wings at the wrists and shoulders more easily fall into a natural position than if the back is left flat. This, however, is not a very important matter.

Your skin now is ready for filling. Take a thin wad of cotton, a little longer than would reach from the bird's head to the end of the body, and roll it between the hands so as to make it a cylinder. It should not be thicker than the bird's neck. Take this between the forceps, and introduce it by a gentle motion into the hollow of the neck, passing it up through the neck until the points of the forceps are within the skull cavity. Lift the skin by the feathers, on one side and the other, pulling it down, but only enough to have it rest evenly over the cotton, and then carefully and gently withdraw the forceps, leaving the cotton in its place. You must, of course, be careful not to catch the skin anywhere on the forceps, and not to wad up the cotton in a bunch anywhere in the neck. The operation is one readily performed, but perhaps not easily described. As good an illustration of it as any is the introducing of a glove stretcher into the finger of a glove.

If you have performed this operation properly the neck is now practically filled, but it will be well for you to take another very small roll of cotton, not more than an inch long, for a bird the size of a robin, and to introduce this above the cotton which stands for the neck, passing your forceps forward until this small bit of cotton rests in the bird's throat close to the bill. Withdraw the forceps, leaving it there. Some people introduce this throat filling through the bird's mouth, but if this is done the tendency is to make the feathers of the throat stand up, which they should not do. This bit of filling gives the bird's throat a natural fullness which adds much to the appearance of the skin.

Now, take a wad of cotton and form it into an oblong mass, somewhat smaller than the bird's body, and place it within the skin, lifting up the skin on either side, and pulling it over, so that the two edges practically meet. You must be careful not to make the body too large, for the object is to have the skin which you have prepared just about the size of the dead bird. It may be a little larger, because the feathers are likely to stand up more or less, but the danger is that you will at first make your skin too large rather than too small. Now take your needle and thread, and by three or four long stitches draw together the opening in the skin through which you removed the body. The bird is now ready to make up, provided you have pulled the legs out and turned them, so that they lie in the right position. The skin of the legs should not be twisted, but the legs should cross each other naturally over the under surface of the tail, on which they rest.

There is danger that as the skin dries the bill may open. This is to be provided against, either by sticking a pin diagonally backward through the chin, just in front of the fork of the lower mandible, and into the roof of the mouth; or, better still, by thrusting your needle through the chin up through the bird's nostril, and then tying the two mandibles closely together. Before making up the skin, look at the eyes, and open the eyelids, and if the eyes seem to be sunken—showing that the pellets of cotton that you placed in the orbits are not large enough—either take the cotton between the forceps and pull it out a little, or with a pin push the cotton up all around the eyelid, so as to give the side of the head a natural—but not too great—fullness. Try to remember how the bird's head looked before you began to skin it, and model the skin on that line.

My attention has just been called by the editors of *FOREST AND STREAM* to an inadvertence of which I have been guilty in adopting for these articles the signature Amateur. This signature, I am told, was many years ago adopted by a Pennsylvania correspondent, who has written under it ever since. If I had known of this I should not have used this pseudonym, and I offer him my sincere apologies for having used his "pen name." The remaining chapters of these talks will therefore be signed, instead of Amateur, TAXIDERMIST.

### The Boy and the Gun.

FORT WRANGEL, Alaska, via Seattle, Wash., April 16.—*Editor Forest and Stream:* The best way to settle the "Boy and the Gun" question is to arrange matters so that our boys now growing up—we might justly include the girls—be given an opportunity to thoroughly familiarize themselves with guns, explosives, ordnance, etc., while they are getting their education in our public schools, say at ages from ten to sixteen or eighteen years of age. If two hours per week were given and devoted to such work, what a grand amount of useful, beneficial, and scientific knowledge would be given the growing generation that are soon to represent our nation. We are at that stage of advancement and evolution when this knowledge should be given at the proper time.

I am anxious to see this most important question thoroughly discussed in the columns of your valuable journal in the near future.

C. H. B.

## Questions on the Flight of Insects.

In the FOREST AND STREAM, a few months ago, I ventured the opinion, founded on a little observation which I once made, that a butterfly could not continue long on the wing at one flight. Since then I have thought that perhaps I was wrong in this. This would not be remarkable, for I have been known to be mistaken on many occasions. I expressed the opinion that a butterfly could not fly more than a mile, perhaps, at one effort; but in reading Darwin's Voyage of the Beagle, chapter 8th, he says: "One evening, when we were about ten miles from the Bay of San Blas, vast numbers of butterflies, in bands or flocks of countless myriads, extended as far as the eye could range. Even by the aid of a telescope it was not possible to see the space free from butterflies. The seamen cried out, 'It was snowing butterflies,' and such, in fact, was the appearance."

If these insects had flown to that distance at sea, it is quite a different thing from my guess of one mile as their limit. Yet I am puzzled to know why my butterfly should have fallen into the lake. It evidently fell through sheer exhaustion. Darwin goes on to say that some moths and hymenoptera accompanied the butterflies, and a fine beetle flew on board. Butterflies we know are numerous in South America, but butterflies in such vast numbers as he here describes we imagine must be phenomenal, even there. They could hardly have come together by some prearrangement among themselves, and the presence among them of the other insects mentioned, which are not known to have any special affiliations with the butterflies, suggests the thought that they must have all been swept

up together over a great extent of country and carried out to sea in a body. However, a further remark of Darwin's seriously militates against this theory, for he says: "The day had been fine and calm, and the one previous to it equally so, with light and variable airs. Hence," he adds, "we cannot suppose that the insects were blown off the land, but we must conclude that they voluntarily took flight." In connection with the general subject he goes on to say that the most remarkable instance he had known of an insect being caught far from land was that of a large grasshopper, which flew on board the Beagle when the vessel was to windward of the Cape de Verde Islands, and when the nearest point of land, not directly opposite to the trade-wind, was Cape Blanco, on the coast of Africa, 370 miles distant. This was certainly a wonderful flight for a creature so little addicted to long-distance excursions as the grasshopper.

In his "Origin of Species," Darwin adverts to the subject briefly in his chapter on the "Means of Dispersal." He states, on the authority of the Rev. Mr. Lowe, that in November, 1844, swarms of locusts visited the island of Madeira. This island is off the coast of north-western Africa not less than 400 miles. On the main land locusts abound in vast numbers, where they are sometimes used in great quantities by the inhabitants for food. In Robbins' Journal of his captivity on the Sahara, a book which boys of sixty years ago used to read, the author tells us that on one occasion his master's family gathered about fifteen bushels of locusts in one night.

Mr. Lowe states that on the occasion referred to, the locusts came to the island of Madeira in countless numbers, as thick as the flakes of snow in the heaviest snow storm, and extended upward as far as could be

seen with a telescope. During two or three days they slowly careered round and round in an immense ellipse, at least five or six miles in diameter, and at night alighted on the taller trees, which were completely coated with them. They then disappeared over the sea, as suddenly as they had appeared, and did not afterward visit the island. All of which goes to show that these insects at least have immense power of sustaining themselves on the wing. As I lift my eyes from the page and glance through the window at my side, it is a wintry prospect that I behold this afternoon. The flakes are falling thick and fast. The remote view is entirely cut off. Between me and the nearer landscape is an ever waving curtain of flakes that renders all objects indistinct. The gate-posts have assumed tall caps of white. My neighbor's roof has lost its sharp outlines, and they are now softened and rounded by the snow. It is an old-fashioned winter, sure enough. The rabbits are dozing on their forms somewhere in the thickets. The squirrels are safe in their winter quarters. The birds have gone out of business entirely. No life is stirring in all the woods. Yet the season is not altogether forbidding. Thus sings Cowper:

"O Winter, ruler of the inverted year,  
Thy scattered hair with sleet like ashes filled,  
Thy breath congealed upon thy lips, thy cheeks  
Fringed with a beard made white with other snows  
Than those of age, thy forehead wrapped in clouds,  
A leafless branch thy scepter, and thy throne  
A sliding car, indebted to no wheels,  
But urged by storms along its slippery way;  
I love thee, all unlovely as thou seem'st,  
And dreaded as thou art!" T. J. CHAPMAN.  
INGRAM, Pa.

## Female Deer Should be Protected.

Editor Forest and Stream:

The paper read by Hon. J. F. Sprague before the North American Fish and Game Protective Association, as published in FOREST AND STREAM, on page 354, ought to be read with such interest as to bring about some action in the combined protection of deer and hunters.

The almost unconscious actions of a hunter, as a result of the mental conditions which there are so correctly analyzed, would seem to show conclusively that any direct law to punish men for shooting their fellow men in mistake for game does not meet the requirements; and that the remedy must go further back and cause a different working of the mental faculties, so that when game, or what is supposed to be game, is sighted, the first impulse may be not to shoot, but to ascertain whether it is that which may lawfully be killed. The forbidding, by law, of the killing of does would bring about just such a change in the mental condition of the hunter. I have long believed that to forbid the killing of female deer at all seasons would be a long stride in the right direction; but not until reading this philosophical reasoning of Mr. Sprague's did I realize how closely associated might be such a law with the preservation of human life; and I would urge any who have passed over this article lightly, or who have not read it, to give it a careful and thoughtful reading. It occurs to me that if such a law were passed, it would eventually and unconsciously bring about some change of sentiment in the sportsman, which would be for the well being of the game. Such a law would mean that in a short time the deer would be greatly on the increase, and that it would become a common thing to see many deer during a hunting trip before securing one. It would become so common, in fact, that to see deer would not be the exception, as it often is now, but would become such a matter of course that the sight would cease to create that abnormal excitement which generally prevails when human lives are sacrificed, and the thought of shooting would not occur until after a pair of antlers had been seen.

An opportunity would thus be afforded to study them, and to get the pleasure which comes from watching wild game in their natural haunts. As it is now, the first and only thing generally thought of is shoot! shoot! and the best part of the woods life is missed. If we were obliged to refrain from shooting, we would, of course, take an interest in watching, and would gradually become so interested in them that the thought of shooting would come only as an after thought, and the danger of shooting a man would thus be minimized.

What true sportsman would not enjoy his hunt more by seeing and closely observing from six to a dozen does, and killing one buck, than by killing two good deer and seeing no more? I have not killed a deer for a good many years, and yet if I had my choice to go into the woods and see a half dozen deer and get none, or get one and see no others, I would certainly get the most real pleasure from the former, and would so choose. Another feature worthy of consideration is that in this way less game would be wounded and left to die in the woods, because a closer observation and a more definite knowledge of the position of the animal fired at would be needed, and the random firing at "spots" and "fleeing

glimpses" would be lessened. For a few years less deer would be killed, no doubt, but in the end it must bring about better conditions for the hunters and the hunted.

EMERSON CARNEY.

MORGANTOWN, W. Va.

## Portable Boats.

ON BOARD A GREAT NORTHERN TRAIN, Montana, March 26.—Editor Forest and Stream: Ever since my last summer's outing in British Columbia I have been intending to write you concerning "Portable Boats," but have not had a good opportunity till to-day, when, as the sole occupant of a sleeping car, I am making a deadly dull trip across the continent with naught in view save vast snow-covered wastes.

The object of my letter is to prompt, if possible, a discussion in your columns on the very important subject of portable boats. The attributes of an ideal portable boat are lightness, strength, rigidity, durability, compactness when folded, simplicity of construction, ease of setting up and taking down, and adaptability for carriage by pack horse.

My experience has been limited entirely to the Eureka canvas folding boat; and my desire to find something better leads me to send you this communication. I have used three of these boats during the last ten years, and have found them in several particulars almost perfect, but greatly deficient in others. They are 11 or 12 feet long, 44 inches wide, and weigh, when packed for transportation, about 80 pounds. For staunchness there is, in my opinion, nothing to beat them, as I have shot rapids in them when standing up, have climbed into them from a muddy lake when wearing heavy rubber boots, have jumped into them in swift waters when wearing waist waders and large hob-nailed shoes; have fired right and left out of them when standing, kneeling and sitting; have bumped them over logs and stones without injury, and have transported them thousands of miles by rail, hundreds of miles by wagon, and numerous long and short distances by both pack horses and men.

When put together in good shape and ready for use, no boat is more serviceable than the Eureka. It will carry three men and a small amount of paraphernalia, or two men and a full camp and fishing outfit; and it is as safe in a stiff wind or a heavy sea as the best of birch bark canoes. To some people this last remark will not appear very forcible; but to a Canadian voyageur, such as in a small way I was when a young man, it is by no means faint praise. In my time I have traveled in bark canoes many hundreds of miles, across large lakes, in rough weather, and up and down swift streams; and never yet have I been capsized, and only twice did I ever ship a dangerous amount of water; hence I swear by the Indian's bark canoe as far as safety is concerned. However, it is an uncomfortable craft in which to stand up and cast either fly or bait, while the Eureka boat is ideal for this purpose.

The bad points of the latter craft are as follows:

First—It is a nuisance to set up, requiring the work of two men for from half an hour to two hours. The work has to be done with patience and caution, in order to avoid breaking something. Again, if one does not look

carefully to the markings of the various pieces, he is liable to get some piece misplaced, thus necessitating the undoing of all his work and starting *de novo*.

Second—The details are cheap and flimsy. The boat costs only \$20, and it would be much better were the price raised a few dollars and the extra money spent on correcting several faulty details. The most conspicuous of these are clips made of cast iron instead of wrought metal, the flimsy wooden stopper that is held by a single screw to the bow or stern stretcher, and the inefficient bearing of the latter at the upper end where it is inserted beneath the junction of the gunwales.

If I were manufacturing the boat I would make the following improvements:

A—All rib clips to be constructed of either wrought iron or aluminum.

B—The clips at the upper ends of the ribs to be rounded and to engage intimately with metal bearings attached firmly beneath the gunwale, thus locating the exact position of each rib, and avoiding the cutting of the canvas by the clips.

C—Floor plugs for holding the ribs in place to be aluminum instead of wood. The wooden ones swell when wet and shrink when dry, and the heads get broken off.

D—A well fitting end and socket to be provided for the bow and stern stretchers.

E—Attach firmly to each of the latter a substantial metal bearing to engage with the forked end of the middle floor board.

F—Mark each piece plainly, so that there shall be no doubt as to where it belongs, and paint on the inside of the canvas a big B (bow) at one end and a big S (stern) at the other.

These modifications would improve the boat greatly, but would not make it perfect by any means.

Third—The Eureka boat when knocked down and folded makes the meanest pack that was ever placed upon the back of that much abused and vituperated animal, the western broncho.

What I am looking for is a canvas folding boat that is as staunch, strong, rigid, seaworthy and serviceable as the Eureka, but which is well detailed throughout, which is easily and quickly set up, knocked down, and folded for travel, and which makes a convenient pack for placing on a horse. It should be large enough to carry safely and comfortably two men with a full camping outfit such as an experienced sportsman would provide for a long trip by boat, provisions for ten days, and all the fishing and shooting paraphernalia for two persons. The weight should be such that one man can readily carry the empty boat, and the price should be reasonable. The matter of facility of repairs should not be overlooked, and the protection of the boat when being shipped as baggage should receive due attention.

I would consider it a favor if some of your readers who have used portable boats would write you, describing their crafts in detail, giving all main dimensions, weight, etc., and pointing out both their good and their bad features; and I would be pleased to receive from the manufacturers of portable boats their catalogues and all the information necessary for a possible purchaser. My address is New Nelson Building, Kansas City, Mo.

J. A. L. WADDELL.

## Birds of Prey do Good.

I WISH I could make a naturalist's plea for the preservation of birds of prey. Must these species, even in our enlightened land, still be the butt of all classes of humanity, after it has become known by the examination of their stomachs that most of them live very largely on the very vermin with which sportsmen and farmers class them?

Every farmer and game-keeper should have a copy of the Biological Survey's report on the stomachs of birds of prey. Beside immense quantities of mice, hawks and owls kill snakes, rats, weasels, skunks and squirrels, all of which species destroy more or less young game birds and the eggs of game birds. Therefore it becomes necessary to know whether the bird of prey himself or all these other enemies kill the most game before judging of his harmfulness. The killing of a hawk or owl is probably almost always the killing of one of your game preservers, whether or no he takes some game in pay. You might as well abolish policemen because they sometimes offend.

Even when the bird of prey gets game birds, it is probable that his victims are most commonly the less vigorous or wounded specimens, so that his influence invigorates the breed by eliminating sickly propagators.

In the meantime we naturalists beg sportsmen not to decimate this, one of our most interesting classes of birds, when they may learn too late that they have killed their own natural game wardens.

There would not have come down to us any race of game birds if the existence of hawks, etc., tended to destroy it.

In the same respect the fish case is remarkably simple. Sportsmen wage war against herons, kingfishers and fish-hawks. Now, since it is well known that the main devourers of trout spawn and fry, for instance, are not any kind of bird, but certain species of fish, you are probably helping thin your trout by removing these birds, since the latter doubtless prey more on the spawn-devourers than on the trout. This is plain, because trout are swifter and hence harder to catch and live commonly in deeper water than other species; so that what the heron and kingfisher get are no doubt generally the enemies of your trout.

Is it not hard that we naturalists must lose our beautiful herons and the wild-voiced kingfishers, and you your trout, because you will not think and understand before you act?

ABBOTT H. THAYER.

MONADNOCK, N. H.

## Do Bears Destroy Game?

FT. WRANGEL, Alaska, April 16.—*Editor Forest and Stream:* This question can be answered by simply saying yes. In speaking thus I speak from actual experience.

While hunting in the mountains in the southern part of Humboldt county, Cal., in the spring or early summer of 1892, I saw a large doe come out of the timber into the open prairie country, turn round and round in a strange manner several times, and then travel in the direction of a clump of willows growing around a small spring which was several hundred yards from the timber. Into this she went and disappeared.

It was a beautiful evening. I had watched the sun set out in the grand Pacific Ocean. The moon had risen above the eastern horizon. It was growing dusk, the shades of night were falling. The doe was not of much interest to me. A big old five-point buck that I knew inhabited that section was what I was after, and it was high time that he, too, was coming out of the timber and into the edge of the prairie where he could have the pleasure of dining to his heart's content on a rich assortment of wild pea vine, white and red clover, and many varieties of wild native grasses.

I was in the act of giving up in despair and wending my way to camp, it having become almost too dark to see the sights on my rifle so that I could do good shooting, when I saw a medium sized black bear come out of the timber on the doe's trail and follow in the direction of the clump of willows where she had taken refuge. Naturally I waited developments. He seemed to approach with much caution. No sooner had he entered the cover of the willows than there was a great commotion, the calling death-cry of the doe, mingled with that gurgling sound that told me that her windpipe was being severed or closed by the fangs of the bear. I lost all interest in the beautiful surroundings, and traveled hard in the direction of the scene of the death struggle, hoping to be able to have a hand in it myself; but as I gained the opposite side of a timbered ravine that separated us, I saw the bear shambling off at a lively pace toward the timber, it having got wind of me. I had two shots at it before it reached cover, one of which took effect, but not fatally. I then went to the scene of the killing, where I found the dead doe and her newly born fawn a few minutes old.

This is the bear's strong point in taking advantage of and killing game animals. I have seen them follow the bands of mountain goats and sheep in the mountains of Alaska for weeks at that time of the year when the females were giving birth to their young. The same with the caribou in western and northern Alaska. I helped hunt a Kadiak grizzly in 1895 that killed a full grown domesticated cow in the outskirts of Kadiak, Kadiak Island, Alaska. A cinnamon bear and cubs killed a 1,200 pound five-year-old mare on my brother's stock range in California in 1897. While mining on the south fork of the Trinity River, northern California, in the summer of 1896, my attention was almost daily directed to a large bear—grizzly or cinnamon—and a very large cougar, or California lion, that hunted together. I found the remains of several deer that had been killed and devoured by them. They have been known for years in that section by the stockmen and miners, who count their depredations by the score.

Bears adopt many cunning tactics in getting and killing game and domestic animals. My father has told me in detail of how he has watched several grizzlies surround a band of cattle, circle round and round them until they could get one singled out from the herd, when they all would give chase, run it into the timber or thick brush, where it would invariably be killed and devoured.

I have seen cattle and sheep that had been run over cliffs and into miry, swampy ground by bears, a feat that was surely never accomplished by accident on the bear's part, but wholly intentional and in accordance to his best interests.

The bear needs no protection in Alaska beyond the limit of say one black or grizzly and one brown per season per sportsman. Let the Indians kill all they can or care to.

Stop or restrict the head and hide hunting of moose, caribou, deer, goats and sheep in Alaska and all will go well. A \$5 bounty for wolves and \$50 on eagles would be of very great benefit to the small amount of game left in that country.

There is a concern in Alaska that has taken from 50,000 to 75,000 barrels of herring from those waters per season for the past several years and converted them into oil and fertilizer. These are the finest herring in the world, and a most excellent food fish. Provision should be made to stop this wholesale slaughter of this valuable fish. Apparently all the interest is centered on the protection of salmon. The herring are just as important as the salmon. U. S. Fish Commission take notice.

C. H. B.

## Erroneous Assertions.

BY MARTIN HUNTER.

MUCH of what Mr. U. J. Pocock, F. Z. S., advances as natural history in "How Nature Preserves Animals," published in the Pall Mall Magazine for January, is contrary to fact.

He says: "To match the snow of the Arctic winter, foxes, stoats, hares and ptarmigan turn white, but they recover their normal dark coloring to harmonize with that of the soil and vegetation of the following spring."

In the case of stoats, hares and ptarmigan he is quite right, but regarding foxes he is wrong.

The white—or as they are commonly called, Arctic foxes—remain white summer and winter; not quite such a pure white in summer, but still decidedly white. They could not be expected to be as pure in summer as in winter, seeing they come in contact with clay burrows, burnt sticks and decayed leaves.

The writer of these lines trapped two white foxes as far south as the north shore of the Gulf of St. Lawrence in October, and they both were of a soiled white.

Furthermore, a white fox is a distinct fox, just as red, cross, silver and black are of other colors. His statement is still further at variance with the fact and misleading when he says, where I have quoted him "foxes." Now, as there are foxes of all colors inside of the Arctic circle, he will not surely imply that red and black ones change with the seasons. Therefore, seeing that both black and red foxes have to get their living by preying on hares and ptarmigan, they must, as a result of their color, be considerably handicapped in securing food.

With all respect to Mr. Pocock, I beg to be allowed to correct another fallacy—in fact two.

He says: "In the case of many of the Arctic seals the pups are clothed with fluffy snow-white hair so that while still unable to swim and compelled to lie on the snow they may escape the notice of the polar bears."

How does he reconcile this explanation with the fact that seals pupped in the end of May or first week in June on the north shore of Gulf of St. Lawrence are similarly clothed in fluffy white, and this where there are no polar bears to molest them?

And inasmuch as bears can only see a few feet ahead of them, I do not comprehend how the color could be of much protection. Bears have very acute scent and sharp hearing, but no eyesight.

My criticism would be incomplete were I to omit to state that seal pups have not to lie on the ice or land to gain strength before venturing to swim. On the contrary they can and do swim as soon as born, and this I assert from my personal observation of their habits and endowments.

Mr. Pocock goes on further to explain the reason of the stripes of the tiger, the light color of the underside of wild horses and asses, but this is outside of my ken, and therefore, like a prudent man, I stop where my knowledge terminates.

## The Building of Birch Canoes.

*Editor Forest and Stream:*

In the communication of William Wells, Esq., on page 353 of your issue of April 30, one of our most interesting and accurate writers of to-day is taken to task for his description of the method of building a birch bark canoe.

I have seen bark canoes built frequently in the country where the scene of the book referred to is laid, and in a number of other places, and by various tribes of Indians, and I have yet to see a canoe built as Mr. Wells describes. The process I have always seen is as follows:

Bark is gathered in the spring. Cedar is gathered—long strips for gunwales, long strips split very thin and about four inches wide to go between bark and ribs, and thick strips for ribs. Black spruce roots are gathered and split for sewing.

These things ready, a flat piece of ground is selected, the strip of bark laid on it (if several pieces are to be used they are sewed together at the edges), a form for the bottom of the canoe is made from sticks and laid on the bark, and large stones for weights are put on bark and form. The bark is now bent upward at the sides and held in place by stakes driven into the ground. The inner gunwale frame is suspended inside the "shapeless bag of bark" from stakes at the ends and sides, and the bark fastened to its outer side. The outer gunwale strips are then fastened in place, great care having been taken all along to bring the bark up so it shall not "belly" anywhere. The longitudinal thin strips are next put in (after removing the bottom frame and as many stones as necessary), and the ribs, already shaped by being "nested" into the two middle ribs, are cut to the right length to make them fit tight and put in, the tips being put under the inner gunwale strip and "swayed" down into place and driven home with a hammer, for it is only in this

way that the bark can be stretched taut. The ends are then shaped and sewed with boiled spruce roots stripped of their bark, the gunwale sewing done, the seams pitched, and the canoe is finished.

I forbear from quoting the last paragraph in Mr. Wells' letter.

Boston, Mass., May 1.

T. J. EASTMAN.

[The question as to methods of construction of birch bark canoes has been raised in these columns before. It is not strange that there should be such a diversity of opinion on the subject, as the process varies in the main or in detail with each tribe. To cover every tribe's ways of building canoes, it would be necessary to give a detailed account of the construction used by each.]

The latest correspondence that appeared in these columns on this subject was in 1902. For the benefit of those interested we would refer them to an article entitled, "Birch Bark Canoe Building" in the issue of FOREST AND STREAM of January 11, 1902. In the following number (January 18), Mr. Stewart Edward White replies to the criticisms of the correspondent whose views appeared in the previous issue. These two letters treat of the methods used by the Penobscot and Ojibway tribes.]

## Trails of the Pathfinders.

PORTLAND, Ore., April 29.—*Editor Forest and Stream:* Permit me to express to you my great appreciation of, and profound pleasure in, the series of articles now running in FOREST AND STREAM, "Trails of the Pathfinders." To me they are the most entertaining reading that has ever appeared in our beloved magazine, and that is saying a great deal.

Most of us are too much disposed to live in the present, thankful, of course, for our wide and bounteous country, our improved arms, our modern equipments, etc., without pausing to reflect upon the hardships and privations that were endured a century ago by others that made it possible for us to have such a country.

Alexander Mackenzie must have been a wonderful man—the personification of determination, force and good judgment.

S. H. GREENE.

## New Publications.

### North American Bovines.

MUSK OX, BISON, SHEEP AND GOATS. By Caspar Whitney, George Bird Grinnell and Owen Wister. The Macmillan Company. Cloth. 284 pages. Illustrated.

This is another volume of the American Sportsman's Library edited by Caspar Whitney.

Mr. Whitney describes his experience in musk ox hunting somewhat as he did in his book "On Snow Shoes to the Barren Ground." It is an interesting and vivid story. He describes the method of travel, of life and of hunting, and the seasons at which one must visit the Barren Ground, and tells what he should take with him. The narrative is graphic and the pictures are extremely interesting.

The bison, whose story is told by Mr. Grinnell, has in it much that is interesting and quite a little that is new. One point of especial interest is the local habits of the buffalo as given in Major Stouch's description of the herd of buffalo which furnished the post of old Fort Fletcher in Kansas with beef during the whole winter.

The mountain sheep chapters are interesting accounts of hunting, interspersed with much close observation and many of Mr. Wister's charming reflections.

His goat article is equally good, and throughout both of these accounts are interspersed characteristic and telling bits of the color of the old-time West. Here, for example, is an incident of a night at some little town, let us say in Washington:

"They gave me a room. \* \* \* I was glad to see as little of it as possible. I washed in the public trough and basin which stood in the office between the saloon and the dining room; and I spent my time either in the saloon watching a game of poker that never ceased, or in wandering about in the world outside \* \* \* I went to my room to go to bed, turned down the bed clothes, and saw there not what I feared, but cockroaches to the number of several thousand, I should think. They scampered frantically, jostling each other like any other crowd. Then I lifted one pillow and watched more cockroaches hurry under the neighboring pillow for shelter. Then I saw that the walls, ceiling and floor were all quivering and sparkling with cockroaches. So I told the landlord downstairs. I said that if he had no other room I would throw my camp blankets on the office table and sleep there, if he had no objection. He was sympathetic, and explained that the cockroaches must have come up from the kitchen, which was below my room. This was Saturday night, and every Saturday night the cook put powder in the kitchen; so that must have sent them up. This explanation was given me in a voice full of confidence. And I replied that very likely this was how they came, and that sleeping in bed with so many at a time would be impossible. He entirely agreed with me."

Here is another bit that will appeal to many big-game hunters of the old West.

"I feel confident that those who have done much hunting of big game have sometimes heard such words as these: 'The mountain used to have a bunch of sheep on it all the time; three hundred sheep'; or, 'Just about here last season I ran into a band of twelve hundred elk'; or, 'I passed two thousand antelope on the flat yesterday.' The person who says this to you will have been your own guide, or some visitor to camp who is comparing notes and exchanging anecdotes. I, at any rate, have listened many times to such assertions; and now and then I have been tempted to observe (for instance) in reply: 'Two thousand antelope! When you'd counted nineteen hundred and ninety-nine, I should think you'd have been too tired to go on.' But these are temptations that I have resisted. I think, too, that the men believed what they said—in a general way. But here with the goat was a famous opportunity. We could see them clearly; they were across a cañon from ourselves, a mile or so away; they were lying down or standing, some eating, some slowly moving about a little; they were in crowds, and in smaller groups, and by ones and twos, changing their position very leisurely; and they seemed numberless; they were up and down the hill, everywhere. Getting to them, this day was not possible, since most of the day was already gone, and we were high up on the opposite mountain side.

"There's a hundred thousand goat!" exclaimed T., and I should have gone home asseverating that I had seen at least hundreds.

"Let's count them," said I. We took the glasses and did so. There were thirty-five."

Following each species is a brief description with the Latin name and its distribution, together with some measurements of horns.

The illustrations of the species are chiefly by Mr. Rungius, though the frontispiece, an artotype, is by Mr. Philip R. Goodwin.

Mr. Rungius' pictures are, most of them, exceedingly good, though of all the bison pictures in the volume it may be said that buffalo very rarely get their heads up as high as they are shown in all these pictures. The very excellent sketches of mountain sheep show different forms known as *O. canadensis*, *stonei*, *nelsoni*, *dalli*, and the so-called *fannini*.

The present volume has an especial interest as treating of two of the three exceedingly odd and unrelated kinds of bovines found in America, and while—except in the case of one species—all those here discussed are looked at only from the big-game hunter's standpoint, there is much that is worth reading in these pages.

## Fishing Up and Down the Potomac

Blue Ridge Rod and Gun Club.

HARPER'S FERRY, at the confluence of the Shenandoah and Potomac rivers, faces the gorge in the Blue Ridge that permits their joint passage to the sea. The mountains here, some twelve hundred feet high, are named Maryland Heights on the one side and Loudon Heights on the other, the thread of the latter range forming the boundary line between Virginia and West Virginia.

A little further down the river splits an outlying range with a like gorge—the half on the Maryland side is South Mountain, the historic, and that in Virginia is called Short Hill Mountain.

Lying between the Maryland Heights and South Mountain, in Frederick county, is an intervalle called Pleasant Valley, and its continuation on the opposite side of the river bears the same name. Midway between Loudon Heights and Short Hill, in the center of the valley, a knoll juts out to the river with an elevation of nearly two hundred feet above the broken waters.

On this beautiful site the Blue Ridge Rod and Gun Club built its home ten years ago. The views in all direction are very pleasing; to the north lies Harper's Ferry, rising on its terraces to Bolivar Heights, and at night presents a charming panorama of twinkling lights, while south, beyond the South Mountain, through the gorge may be seen the hazy blue of the Catoctin range.

The architectural and domestic arrangements of the club are creditable and cozy.

The stretch of water in front of the club house and as far down as the Catoctins, at Point of Rocks, was for years one of the best in this great river. Too deep for wading, too strong and broken for boating except with expert handlers, its very difficulty was a protection, and few localities of this great bass stream furnished better strings—as the records of the club will show. For the last two years no catch has been recorded for these waters, though not for lack of trying by many fishermen—and the club numbers some of Washington's best anglers among its members.

The cause is not far too seek. Standing on their lookout point on Saturday for the first time, the churning waters, now clear and green, seemed an ideal preserve for the little-mouth bass. A second glance, however, revealed the fact that the whole surface of the water was dotted with yellow shavings. A closer inspection showed that the rocks and overhanging shrubs held drifts of them, the deeper water had not only the surface covered, but water-soaked shavings were being hurried along six inches to a foot under the surface and tumbling along the bottom. Pools that were once six feet deep are shallows now, where shavings have filled them up and freshets have partially covered these with sand. The curse is cumulative and the shavings are met with as far down as the mouth of the Monocacy. Occasionally a flood will tear out accumulations and carry them further, to be dropped again so that no deep water below is safe from this civilized outrage.

At Harper's Ferry are a couple of pulp mills, one on the Potomac and one on the Shenandoah. These, it is said, use the mechanical process of grinding the pulp, and the fluid wastes are not offensive nor do they discolor the water, and it would seem that but for the mechanical waste of the shavings no great harm would be done to the stream, the fish or the anglers by these enterprises.

The difficulty of effecting a cure by negotiation is that so soon as the subject is broached, those interested can see nothing but hostility to the pulp mill itself, instead of the one feature of the shavings. The proprietors enjoy the reputation of being honorable and high-minded gentlemen, the business gives employment to labor and trade in the locality, and to hint at burning the shavings is interpreted to mean a threat at the institutions and is resented. It is unfortunate, for it would be so easy to avoid this great wrong without in the least disturbing the mills.

The short logs, principally of poplar, are ground to a pulp, but the present method utilizes only the heart, and the sap-wood is first cut away with knives, which make a shaving such as country coopers make from barrel staves, and these are dropped in the stream as the easiest means of getting rid of them.

This waste will be avoided later and the sap-wood will have a value, but just now this makes all the trouble. It is simply a question of destroying this waste, instead of throwing it in the river. It could be easily burned, as is done with the waste of Canadian sawmills and some of our own.

The appliances for this purpose would not be expensive, and the fishermen could almost afford by contributions to put up the necessary funds, if no other way is open to relieve them of the pest and restore the fisheries now practically destroyed.

It is said that the defense offered by the owners of the mill is that no harm is done to the fish, that their

spawn may even be found upon the shavings.

The first harm is interference with the tackle. With these shavings on the surface, no man could catch fish with a fly, if the river was full of fish, since every cast would engage the floating or catch the submerged shavings, to the destruction of his tackle, the disturbance of the fish and the wasting of his skill, by spoiling his cast. It would be sure to destroy his temper as well, and perhaps even threaten his religion.

Casting bait is equally out of the question, and bottom fishing is not safe from interference by the flood of chips.

The other harm is covering the bottom of the stream—especially deep pools, favorite haunts of the fish—with the shavings. These are long in decaying under water, but they do decay, and one cannot imagine any self-respecting bass keeping house in a marine woodshed. The carpet of chips kills out the natural vegetation along the river bottom; the absence of vegetation interferes with the natural plankton, the minute organizations upon which the newly hatched fish must depend for sustenance, and the young fish are starved to death.

The eggs of the bass stick tightly to whatever they may be dropped on, usually a little bowl of clean gravel. It is possible that spawn may be found fastened to shavings. After establishing the fact that the spawn was bass' spawn, and had not been placed there artificially, it would be time to weep over the desperate condition of the poor abused fish that could find no other place to make its bed. As shavings are certainly the last place a bass would choose to nest, it would clearly establish how absolutely that locality must be covered.

There seems to be much doubt as to the rights and remedies of riparian proprietors on the subject of pollution, and yet there is a long line of decisions under the common law proceedings in equity and the statutes—civil actions for damages and the extraordinary remedy by injunction. The courts have declared: "Riparian rights are founded upon the ancient doctrine of the common law. If the law is a progressive science, courts should keep pace with the progress and advancement of the age, and constantly bear in mind the wants and necessities of the people, and the peculiar conditions and surroundings of the country in which they live. In this connection it has been said to be one of the excellencies of the common law that it admits of perpetual improvement by accommodating itself to the circumstances of every age, and applies to all changes in the moods and habits of society, and that in this respect it will never be outgrown by any refinements, and never out of fashion while the ideality of human nature exists."

"The rights of riparian owners are well understood, and there is a general concurrence of opinion in the courts as to the manner in which they must be exercised. The law on this subject is strictly in accord with the common sense and general convenience of mankind. The owner of the land has a right to the use of a stream of water which flows through it for all useful and reasonable purposes. This use is not an easement, but is an incident to his property in the soil; a necessary inherent and inseparable portion of his ownership. But there is an equality of right in other riparian owners above and below him on the same stream; and from the necessary condition of the case, they must not use the water to the prejudice of each other's rights."

"A riparian proprietor who uses the water of a stream in manufacturing white tissue paper is entitled to an injunction restraining as a nuisance the discoloration of the water preventing the manufacture of such paper."

And just here is a tribute due one of the pulp mills at Harper's Ferry, which did restrain the washing of iron ore in the higher tributaries, on the ground it interfered with their industry. For this the anglers in these waters ought to be grateful. Ore-washing has killed the fish in many West Virginia streams, and the pulp mill did a good turn for us when it arrested the pouring of the loathsome, deadly sulphur waters into the Potomac.

But the same right the pulp mill claims—to have its water uncontaminated by any foreign matter—it ought to grant to those below and render the water as it found it, free of the curse of chips.

Another court has held that "whether knowledge of the effects of such deposits in a stream is necessary to be shown to constitute the defense of nuisance or not, when the pollution of the stream must necessarily be apparent to one engaged in making such deposits, he will be held to have notice of the effect of his acts."

It is said that the mills are under a conditional pledge to abate the nuisance, and it is to be hoped this may be done without recourse to litigation, which is an expensive luxury, and nearly always productive of an undesirable friction.

Some of the local anglers, pessimistically inclined, are not sanguine of any voluntary relief, as they assert that like promises have been made from time to time for several years.

There is no bass stream in the world to equal the Potomac. At this point it is as beautiful as any trout stream of the Adirondacks or Canada. The adopted home of the small-mouth black bass, it has become naturalized here, and, like ourselves, has outstripped all creation.

This stretch of water is now ruined, most of the fish destroyed, they can neither multiply nor live in this daily bombardment of poplar chips—and it would be so easy to keep the shavings out of the stream.

If this were done, a few spring floods would clear out some of the haunts and it would be but a little while before the pools would again swarm with this king of inland waters.

Not only would this justice bring happiness to many an angler, but the neighborhood would profit as well.

When fishing at Harper's Ferry is good, not a week in the season that strangers do not come in, and the revenue they scatter is not to be despised.

The mill is a benefit to the locality, but so are visitors. The hotels and stores, the stables and boatmen, and railroads, all share in the moneys distributed by the angler.

The little State of New Hampshire is said to spend five million dollars in attracting and entertaining summer visitors, and to collect eight millions from these transitory guests. The parallel is a little short, but it is there. Why not have the good of the mill and the anglers, too?

There is every argument why these shavings should not go into the river—not one reason, not one right, not one excuse, why they should. HENRY TALBOTT.

## Fish and Fishing.

No Spring in Canada.

FROM Lake Edward I hear that the fishing is likely to open about the 15th or 20th of the present month. There is still a good deal of snow in the woods, so that despite the hot weather already prevailing, the temperature of the water in the northern lakes is likely to be kept down for some time after the disappearance of the ice by the inflow of the snow water from the interior of the country.

During the latter part of May and the first half of June more fish will probably be taken by trolling and bait-fishing than with the fly in the Lake Edward district, especially in the larger lakes. For trolling in Lake Edward I have always found minnows to produce the best results, the artificial killing very well when the small fish themselves cannot be had, though there are generally plenty to be found in the shallows of the many bays of the big lake.

The large trout of this lake are by no means averse to taking quite a big spoon, though it is a barbarous weapon upon which to impale these beautiful game fish. For all kinds of trolling in these waters during the first few days after the disappearance of the ice, the trout will doubtless be found fairly close to the surface. It is under these circumstances that the occasional kinking of the line forms one of the principal drawbacks to the pleasure of trolling. With fairly deep water trolling it is possible so to arrange the sinker as to prevent this annoyance; whereas in trolling near the surface of the water it is customary either to do without a sinker at all or to make use of one altogether too light to afford the necessary *vis inertia* to resist the rotary motion of the bait, and to compel the swivels to act. Without this there is an insufficient resisting power in the leads, and the twist, instead of being confined to the trace below them, extends upward to the running line and produces kinking, while the leads cannot be materially increased in weight without rendering the tackle useless. The only satisfactory manner, therefore, of preventing the occurrence of the nuisance, is to hang the lead horizontally underneath the line instead of on it. It will be found that by changing the center of gravity, the resisting power of the lead is for the purpose in question more than quadrupled, without a grain of weight being added to the tackle. The proper action of the swivels is insured, and all approach to kinking prevented.

Opening of the Maine Fishing Season.

Maine, like Quebec, is anticipating a successful angling season, and for the reason given in this column a short time ago, namely, the late disappearance of the ice. Mr. Leroy T. Carleton, chairman of the Inland Fisheries and Game Commission of the State, writing me on the 29th ult., says: "We have had a long spell of winter since the meeting here of the North American Fish and Game Protective Association; consequently the ice is late in leaving the lakes, and but few are as yet clear. Sebago Lake, near Portland, is one where fishing has commenced and many good catches are reported. We are hoping for a good season, however, as it is usually considered a good omen when the ice is exceptionally late in breaking up."

What Mr. Carleton says about anglers looking for and usually finding the best sport in those seasons which open the latest, is undoubtedly true of Canada as well as of

Maine. But why should it be so? Can any of *FOREST AND STREAM*'s readers give an intelligent reason for it? Are the trout more greedy after a long winter than a short one, just as a man might be expected to be more hungry for his breakfast after a long night and morning spent in bed than if he had risen early and taken his food at the regular hour?

#### Restigouche Salmon for Newfoundland.

A shipment of 75,000 Restigouche salmon eggs has been sent to Newfoundland, where it is desired to introduce a larger class of fish than now found in the rivers of the island colony. The press dispatches refer to this shipment as the introduction of a different species of salmon to that now found in Newfoundland, which is absurd. The *Salmo salar* of the Restigouche and of the rivers of Newfoundland are identical, though there is undoubtedly a very great difference in the size to which they grow in New Brunswick waters and in those of Newfoundland. But there is just as much difference between the sizes in different rivers in the Provinces of New Brunswick and Quebec. In both Provinces I know of rivers containing fish each more than forty pounds in weight, and of others from which it is a rare occurrence to take a salmon weighing more than eighteen or twenty pounds.

Experience alone will tell whether the introduction of the young salmon hatched from the eggs of Restigouche fish will increase the size of the salmon in the Newfoundland rivers in which they are to be planted, but whether it does or not there is one thing that the authorities of the island colony must do if they wish to let the larger fish run up the rivers at all, and that is to look more closely after the netters who at present successfully bar the progress of all the fish above a certain size.

E. T. D. CHAMBERS.

### Fish and Game Increase.

BOSTON.—No more satisfactory report has ever been made by the Massachusetts Fish and Game Commission than that just out for 1903. With the one exception of partridges, which suffered serious loss by the cold and wet of the summer, there has been marked gain all along the line. Forest and stream, mountain and valley are being repopulated by the fish and game which seemed until recently to be suffering an inevitable decline. Part of the gain is due to the reforestation of abandoned farms and the increasing scarcity of mankind in considerable areas in many parts of the State. Another part is due to the scientific work of the Fish and Game Commission. Another part may be credited to the enforcement of stringent laws for the protection of game. Growing popular interest in outdoor concerns, and in the lives of animals is evident from the attendance at the State house upon the hearings of the Legislative Committee on Fisheries and Game, as well as the increased demand for the reports of the Commission. On the latter point, the report says: "The demand for documents issued by the Commission, especially those containing laws, has reached large proportions. Compliance with it is a matter of public necessity. The Commission has striven to supply this class of literature to the public, and thousands of documents are now sent out, instead of hundreds, as formerly."

The Commission cost the State \$27,555 last year. Of this, \$18,445 was spent for the enforcement of laws, the propagation and distribution of fish, birds and animals, and the maintenance of fish hatcheries; \$5,630 for the compensation of the commissioners; \$1,550 for their expenses, and the remainder for minor items. The aggregate output of fish eggs, fry and larger fish, was over 15,000,000 for the year. At the spring planting of brook trout 903,000 fry and 10,000 brown trout were put out. In the fall 59,660 fingerling brook trout were planted in the brooks, 1,500 yearling brook trout, 9,000 brown trout fingerlings, 1,000 rainbow trout fingerlings and 12,000 land-locked salmon fingerlings were liberated in ponds, and 600 adult yearling brook trout were put into ponds and rivers, while 1,000 brook trout and 500 rainbow trout were reserved to increase the brood stock. The commission put 6,000,000 land-locked smelt eggs into ponds where the smelt has not been before.

In return for the investments by the Commission come reports from the deputies in all parts of the State of great improvement in the fishing conditions. One deputy writes: "As a result of stocking the brooks in this town trout fishing is the best it has been in twenty-five years; we got more trout and much larger fish." C. H. Pease, a merchant in Lee, president of the club which has a house at Greenwater Pond, in Becket (in the Berkshire Hills), writes: "Our people very much appreciate your efforts to stock our lakes and streams with game fish."

Work at the fish hatcheries has been prosecuted vigorously during the year. At Sutton, though there were somewhat less fingerlings raised than in 1902, yet the report of the superintendent says that they were "far superior in size and quality." Several thousand fish exceeded four inches in length and hundreds were five and six inches long. But the trout have plenty of enemies, including themselves, for the report says: "The heaviest loss of trout fry was from causes generally termed unknown. This includes the losses from frogs, snakes, predatory birds, animals and insects, cannibalism among the trout and loss from disease and weakness." Fish-eating birds get many, especially kingfishers and herons. Thirty of the former and nine of the latter were taken at the Sutton hatchery. Reports of trout fishing from all over the State show improved conditions. A report from a Berkshire county deputy says: "The trout season in the western section of the State was the best it has been in a number of years; larger trout and bigger strings were taken." One from Franklin county says: "I found the trout fishing excellent, large ones more plentiful than in former years." One from southern Worcester county says: "Trout fishing was never so good. All fishermen say there was more trout caught this year than the entire aggregate of the last four or five years. Some of the brooks make me think of streams I have seen in the British provinces—almost alive with trout." From the north of the county comes a similar report.

The report takes strong ground against the killing of song and insectivorous birds, especially by camps of Italian laborers, who seem to care nothing for preserving the birds or for keeping the laws, and further restrictive legislation is recommended. These birds are pronounced of incalculable value to the farmers.

Most remarkable, perhaps, of the whole report, is the part which shows how deer are increasing all over the State. Years ago the Plymouth woods were the only place where they could be found, and they were regarded as something very peculiar, as a survival of a dim past and as really a part of the wild west. But now, from many towns, from Cape Cod and Cape Ann to Berkshire come reliable accounts of the presence of deer. They have even come very close to Harvard College, which is only three miles from the State House. Plymouth sends word they are more plentiful than usual. New Bedford says: "Deer are very plentiful in this vicinity." Marshfield, Raynham, near Taunton, Sherborn, Milford, in the south part of Worcester county, and many places in the northern suburbs of Boston and others all through Essex county in the northeast, send word of the new and strange presence of deer. A deputy writing from Gloucester says: "Deer are reported seen at Gloucester, West Gloucester, Essex and Manchester, especially at West Gloucester and Essex, where they have been seen nearly every day, three or four being seen together at one time." A writer from Haverhill says: "During the last four months I have seen fourteen deer." From Ayer, in northern Middlesex, comes this word: "Deer are gaining in numbers. Last fall three of four in a bunch was the usual number; this year from six to eight were seen." All through Worcester county they seem to be numerous. One writer from Ware, in Hampshire county, says: "There is a large increase in the number of deer. It is common to see them among cattle and sheep while riding through the country." Another says that deer have been more numerous than ever, and that one farmer reports seeing twelve on his farm. Another says that four stayed on his farm all summer without doing any damage to his crops. A deputy, writing from the town of Florida, which is in Berkshire, on the top of Hoosac Mountain, says: "If this town, Florida, could be fenced in, it would not need any stocking to be a deer park. I am certain that in parts of the town it is not unusual to see as many as eight deer, and fourteen have been seen together by reliable persons in one day." Further reports from the Franklin county hills and the Berkshire county forests are to the effect that deer are increasing.

The report shows that quail are plenty all over the State, and that the Belgian hare is multiplying also. Mongolian pheasants are proving a successful bird for introduction. The State has taken pains to introduce them in many places, and they are multiplying and meeting the expectations of those who brought them here in the first place. There is more interest in fish and game matters than for a great many years. There is more intelligent study of the animals and more care to preserve them from needless and reckless destruction. With the increase of forest growth and the posting of lands, which is possible under the protection of the law, it is evident that Massachusetts is in a prosperous way to become a great game State, and that her food supply will be materially increased by the scientific cultivation of her forest and stream resources.

#### Kentucky Hunting and Fishing Club.

THE Kentucky Fishing and Hunting Club is a new organization of prominent sportsmen of Cincinnati, O., and Covington, Ky., which was formed at a meeting held in the Stag Café on May 3. The following officers were elected: President, G. F. Ahlers; Vice-President, R. H. West; Secretary, A. B. Heyl; Treasurer, Joe Coyle; Directors—R. McGraw, W. A. Stewart, O. Steinwedel, S. Ullman, H. F. Juergens, and the officers.

At this meeting all arrangements were completed for the purchase of a tract of land and water containing over 100 acres located at Crystal Lake, a few miles from Covington. The club proposes to erect a club house equipped with everything necessary for the comfort of its members, and when their plans are completed will have the best premises of any similar organization of the kind in this section of the country. Following is a list of members in addition to those elected to office: J. P. Rampe, Fred Drehs, H. D. Hamlin, R. C. Stewart, Jr.; Robert S. Stewart, Jacob Zeigler, Thos. Dunn, F. W. Foulds, C. L. Newton, Chas. Bennett, J. F. Hettich, A. Juergens, M. Messingschlaeger, R. C. Anderson, M. McLean, Frank Rampe, Emil Werk.

#### Theodore Samuel Thompson.

WE record with sincere sadness the death of our old correspondent, Juniata.

Theodore Samuel Thompson, son of the late William Thompson, Jr., and Charlotte Chambers Patterson Thompson, died April 23 in his seventy-fifth year, at the homestead, Thompsonstown, Juniata county, Pa.

He had long been a reader of *FOREST AND STREAM*, and under his pen name Juniata had contributed many charming sketches and notes to its columns. He was an enthusiastic sportsman of the old school, devoted to quail shooting, and a lover of good dogs. His keen interest in his favorite recreation continued through life.

#### New Publications.

Little Rivers. A Book of Essays in Profitable Idleness. By Henry Van Dyke. Illustrated. 348 pages. Charles Scribner's Sons.

The charm of the Rev. Henry Van Dyke's writings is known to many people in many places. Little Rivers is one of the most delightful of his many charming books, dealing with the streams, the fish that live in them, their surroundings, and the taking of those fish. These little rivers are of more lands than one, but the tale of them is told always in a fresh, appreciative and loving style—discursive withal—but ever charming. The true angler must read of these streams, and will profit by the reading. Price, \$1.50.

A River of Norway; Being Notes and Reflections of an Angler. By Chas. Thomas-Sanford, with 10 photogravure plates and a color plan. 168 pages. Longmans, Green & Co.

This is a very beautiful book, dealing with salmon fishing in Norway, and illustrated, as said, with photogravures of very great beauty. Every angler may well desire to have the book in his library. Price, \$3.50.

## The Kennel.

### Rabies.

From Hill's "The Dog, Its Management and Diseases."

THIS disease may be truly designated the scourge of the canine race; horrible in its nature, alike terribly fatal to man and beast. As such it was recognized centuries ago, and the alarm engendered appears to have been as great then as in the present day. Among the ancient Greeks recipes both for the bite of a rabid dog and the flesh of one affected with rabies, were numerous and singular.

Much, but far from enough, has been written of late years concerning this disease; much that is sensible, and no small proportion that is calculated to do harm. Rewards have been offered for the discovery of a cure, but the probability of their ever being claimed is extremely dubious—especially so long as spurious hydrophobia and various phases of hysteria are indiscriminately mixed up and mistaken for the real malady.

Pasteur's alleged prophylactic still remains a controversial question; many unfortunate calamities have resulted from his system, and the necrological record is anything but encouraging.

Fortunately, however, compared with other canine maladies, rabies is of rare occurrence, and it would almost appear to derive its importance from periodical scares. The year 1887 will be memorable for the intense public excitement on the question, and especially for the extraordinary manner in which morbid minds magnified the complaint, and painted harmless affections in hideous colors. These morbid minds being suffered to run riot, worked an almost irreparable injury to our ordained companions and most devoted friends. An absurd hysterical scare promoted an equally absurd, and, in my opinion, ungrounded hydrophobic alarm. The outcome of this panic, and the arbitrary administration of the police regulations, were the formation of "The Dog Owners' Protection Association," the preliminary meeting for its promotion, over which I had the honor to preside, being held at the Hyde Park Hotel, on the 30th of August, 1887. Subsequently Lord Mount Temple became president. Following this, but holding adverse views, "The Society for the Prevention of Hydrophobia" sprang into existence. Then Lord Mount Temple's Registration Bill was introduced, and referred to a select committee of the House of Lords, at which I was summoned to give evidence.

It is a fact worthy of note that the sudden withdrawal of the police regulations and muzzle in London, which took place the day before my address at the first public meeting of "The Dog Owners' Protection Association" in the Kensington Town Hall, produced no increase of rabies.

Before going into the nature and symptoms of the malady, a few words regarding the terms applied to it are, I think, necessary.

Hydrophobia, signifying fear of water, is in canine pathology a misnomer, and probably has had much to do with the erroneous idea that this symptom is present in dogs. To this I give, as I did many years ago in *Land and Water*, a most emphatic denial. The rabid dog never in any stage of the disease exhibits a dread of water, neither will the sight or sound of it produce spasms. On the contrary, thirst is present throughout.

The inability to swallow fluids, when it does happen, is dependent entirely on either the inflammatory condition of the throat, or from paralysis of the muscles of the lower jaw and deglutition.

Rabies, signifying madness, is a far more appropriate term, but even this is not sufficiently distinctive as to the particular class of madness it is intended to designate.

The true nature of rabies is still involved in mystery. We know that a specific virus is the active agent in its production, but in what this virus consists, or how it is developed, we know not. That the saliva is the vehicle of the poison is clear, the why or wherefore is equally mysterious. Post-mortem and microscopic examinations afford little clue. The nerve centers in which, from the character of the disease, we should expect to find the greatest lesions, are, in many instances, but slightly affected, while the throat and digestive organs often exhibit the greatest alterations.

Causes.—In almost every instance rabies is due to inoculation; the disease, however, may, and is at times unquestionably spontaneously generated, and if this is so, wherein lies the value of the vexatious and absurd police regulations? I am very much inclined to think that the pernicious system of breeding in-and-in encourages its development, for it undoubtedly predisposes the next generation to weakened intellect, if not absolute lunacy. We know that inter-marriage materially helps to fill our lunatic asylums; and although it may be observed that the madness produced by consanguinity is not hydrophobic, yet any agency acting deleteriously on the nerve centers, weakening their stamina, and diminishing the intellectual faculties, will render, or may be reasonably supposed to render, the mind susceptible to morbid impressions.

Again, individual idiosyncrasies are present in the canine, as they are in the human race; and this fact should not be lost sight of when investigating the cause of nervous disorders.

It is a well recognized fact that, since the improvement (query) of breeds, the fashion of dog breeding, and the growth of canine exhibitions, rabies—or what has been alleged to be rabies—has correspondingly increased.

It is true, advance in scientific knowledge and research may have made more acute diagnostic talent, but it must not be forgotten that nature abused will result in abnormality of some kind. Of this we have palpable evidence in those specimens of the toy breed, with prominent foreheads, protruding, vacant eyes, and hairless skulls, which creatures, to use a common expression, have been "bred to death."

Probably, as a veterinarian, and having made canine pathology a specialism, I have had as wide an experience in rabies as any member of my profession now living; and I can say, without the least hesitation, that in those dogs proved to have been inbred, rabies and other

nervous disorders have been more prevalent than in natural breeds.

That dogs, especially of the female sex, are subject to hysteria, there is no doubt, while the tendency to such a condition among the female portion of our own species is beyond all question.

And we have it on the authority of one of the greatest physiologists of our time, that "many forms of that protean malady, hysteria, are attended with a similar irritability of the nervous centers" as occurs in hydrophobia; further, that the latter disease "is nearly allied to that of traumatic tetanus."

This evidently is an hysterical age, and persons of highly nervous temperament and excitable dispositions are prone to manifest certain symptoms indicative of hydrophobia, should they have the misfortune to be bitten by one of our long suffering canine friends.

Those who have had much to do with dogs, and have carefully studied their various dispositions, cannot have failed to note those same peculiar hysterical tendencies in highly bred specimens—nervous and violently excited at an angry word or sudden sound. Shrieking at a trivial injury, convulsed with fear at an upraised hand—not rabidly inclined, I don't say that, although it has been positively asserted that the bite of an angry dog is as dangerous as that inflicted by a rabid one, and equally capable of producing hydrophobia; an opinion, however, which I do not at all agree with. But I cannot see why the nervous system of a physically weak and excitable dog should not be acted upon much in the same manner as in a physically weak and nervous human being, and in such a way as to excite symptoms strongly representative of rabies.

I have already spoken of the saliva as the vehicle of the rabid poison, and of the mystery as to its development. It is known that certain conditions of the nervous system exert an influence on the secreting process of the salivary glands, and we know that in canine rabies there is an abundance of such secretion abnormally altered. In fact, it may be said that all the secretions are more or less influenced by the condition of the mind; so much so that in certain instances they become poisonous from chemical change, and lose entirely their individual characters. May not this be so with the canine secretions?

Although I grant that canine rabies is most frequently due to inoculation, I do not lose sight of those causes favorable to spontaneity, of which there is far greater weight of practical evidence than that built up on theoretical bases. Nor do I forget that every disease has had a beginning, and canine rabies (which is now being dealt with as though it were a modern invasion) was well recognized by the ancient Greeks and Romans, and if we are to believe history, the prophylactic value of the hot-bath and accompanying sweat for bitten persons was well understood by Celsus.

Further information on this point may be obtained from the Blue Book containing the evidence of the various witnesses who attended the select committee on rabies in the House of Lords, 1887.

The influence of climate, season, or sex, would appear to have little bearing on the subject.<sup>1</sup> The so-called dog-days no more act in the production of rabies than does cold. In the hottest season of the hottest years, statistics show fewer cases, while in tropical countries—Australia to wit—it has as yet been unrecognized. Heat is more likely to generate brain affections other than rabies.

With regard to sex, male and female are alike disposed to it, and various conditions of system in the latter, as catamenia, pregnancy, or suckling, have no influence on the disease, though they may produce symptoms of other cerebral aberrations.

Anger and pain are alike uninfluential in the origin of rabies.<sup>2</sup>

<sup>1</sup>"Prof. Giuseppe Canettoli ('Lo Sperimentale,' June, 1875) summarizes his studies and researches in hydrophobia in the following propositions:

"1. Hydrophobia is a disease of all climates and seasons.  
"2. Extreme climates yield the smallest contingent of cases, and are therefore, it may be said, privileged.  
"3. The disease is spontaneous in the dog, and communicable to other animals and to mankind.  
"4. Nothing has been discovered of the nature of the malady or autopsies.

"5. The disease may be prevented by having recourse to timely cauterisation—the best means being the galvano-caustic.  
"6. Finally, to explain the duration of incubation, Canettoli supposes that the saliva of the rabid dog is not in itself a poison, but that it becomes so through prolonged retention in the living tissues into which it has been inoculated."—Veterinary Journal, October, 1876.

<sup>2</sup>In reply to this theory, advanced by Dr. Verity, in the Manchester Courier, 1875, and his assertion of possessing a cure for the malady, I wrote the following:

"That the bite of a dog or cat is rendered poisonous from anger at the time of its infliction is as absurd as it is false.

"That rabies is a specific disease usually produced by inoculation, but that it may, as I stated in 'Land and Water,' some four years since, and unquestionably does, arise spontaneously. Certain peculiar changes in the system, possibly due to atmospheric influence, or some cause not fully understood, act in producing it. I have always had a strong opinion that breeding in and in tends to do so.

"That if once the virus enters the system through inoculation, no amount of treatment, however, scientific, will in my opinion prevent the awful result that must sooner or later take place.

"That when such result is established, there are as yet no positive means of preventing death.

"That the only means of preventing its introduction into the system are in immediate excision or suction, if possible, of the part, and the application of nitric acid or lunar caustic.

"That many diseases have been mistaken by persons having a smattering of a dog knowledge for hydrophobia (rabies canina), particularly epilepsy.

"That I have no doubt a person whose nervous system is highly sensitive may, from the excitement consequent on the bite of a dog (especially a ferocious one), exhibit symptoms resembling hydrophobia, and that it is probably from such cases as these that Dr. Verity has derived his imagination of a cure.

"That individuals ever have true hydrophobia, from pure fright, I do not for a moment believe.

Pain may produce frenzy, but not rabies. A dog may be driven frantic with torture or furious with rage, but his bite is harmless, so far as production of rabies is concerned. Were it not so, what a fearful result must follow! Where we have one case of the disease, we should have hundreds! Indeed, they would be daily occurring, and no individual who possessed a dog would be secure.

No one distinct breed is more liable to it than another.

Mongrels (particularly homeless ones) are perhaps more frequently affected than other classes, and this is more likely from the manner of their roving from place to place, coming into contact with strange dogs, and usually those of their own kind; added to which they are reared in filth, and live by scavenging.

How often, after an outbreak of rabies, do we hear that a strange dog has been seen in the neighborhood, belonging to nobody knows who, and generally described as a mongrel?

Dogs are especially inclined to fraternize, or, at all events, to inspect one another; and this, as with human paupers, is particularly the case with mongrels and curs. A stranger is immediately gathered round, sniffed over, followed some distance, and perhaps hustled; the stranger resents it, or even if not thus interfered with, snaps at the one obstructing him, and passes on his way. The same thing happens over and over again in his course; and I need hardly say (presuming him to be rabid) the horrible result is multiplied indefinitely in a like manner by his victims.

[TO BE CONTINUED.]

"That in all supposed cases of hydrophobia the public may rest assured that either the inoculation was not hydrophobic, or that the saliva was wiped off when the teeth passed through the garments.

"That in all instances where the animal which has inflicted the wound is suspected of rabies, he should be confined, and not slaughtered until a sufficiently long period has elapsed to prove the suspicion correct or otherwise. This, if it were adopted, would soon test the truth of enumerated cures and the value of marvelous specifics."

## Points and Flushes.

Volume XX. of the American Kennel Club Stud Book for 1903 contains 1,476 pages. It abounds with valuable information concerning canine matters. The main features are the registrations; a list of bench show winners, bench show judges; the officers, committees, active members and associate members of the A. K. C.; cancellations, champions of record; corrections, foxhound and beagle trials; kennel names, prefixes and affixes; Pacific Advisory Board, etc. The registrations number from 70,973 to 77,567. Copies can be obtained of the secretary, Mr. A. P. Vredenburg, 55 Liberty street, New York.

## Yachting Fixtures for 1904.

Members of race committees, and secretaries, will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

### MAY.

28. New Rochelle, L. I. Sound Y. R. A., special, New Rochelle.
30. South Boston, Mass. Y. R. A., City Point, Boston.
30. Harlem, Long Island Sound Y. R. A., annual, City Island.
30. Bridgeport, L. I. Sound Y. R. A., special, Black Rock.
30. Indian Harbor, L. I. Sound Y. R. A., special, Greenwich.
30. American Power Boat Ass'n, championship, Manhasset Bay.

### JUNE.

4. Boston, Mass. Y. R. A., City Point, Boston.
4. Knickerbocker, L. I. Sound Y. R. A., annual, College Point.
11. Corinthian, club race, Marblehead.
11. Manhasset Bay, L. I. Sound Y. R. A., annual, Sand's Point.
11. Columbia, power boats, Hudson River.
16. New York, annual regatta, Lower Bay, N. Y.
17. Boston, Mass. Y. R. A., Hull.
18. Larchmont, spring regatta, Larchmont.
18. New York, Lysistrata cup, Sandy Hook Lightship.
18. New Rochelle, power boats, New Rochelle.
18. Squantum, Mass. Y. R. A., open, Squantum.
20. New York, special races, Glen Cove.
20. New York, power boats, Glen Cove.
21. New York, Glen Cove cups, Glen Cove.
23. American Power Boat Ass'n, challenge cup, Hudson River.
24. American Power Boat Ass'n, challenge cup, Hudson River.
25. Corinthian, club race, Marblehead.
25. Seawanhaka, L. I. Sound Y. R. A., annual, Oyster Bay.
25. New York Athletic Club, ocean race, Long Island Sound.
27. American Power Boat Ass'n, challenge cup, Hudson River.
27. Manhasset Bay, challenge cup series, L. I. Sound.
28. Manhasset Bay, challenge cup series, L. I. Sound.

### JULY.

1. American, L. I. Sound Y. R. A., annual, Milton Point.
2. Corinthian, club race, Marblehead.
2. Brooklyn, ocean race, New York to Marblehead.
2. New Rochelle, L. I. Sound Y. R. A., annual, New Rochelle.
2. American, power boats, Milton Point.
2. Eastern, open race, Marblehead.
2. Eastern, squadron run to Gloucester.
4. Corinthian, invitation race, Marblehead.
4. Eastern, special open, Marblehead.
4. Larchmont, annual Larchmont.
4. Hartford, L. I. Sound Y. R. A., annual, Fenwick.
4. Indian Harbor, power boats, Greenwich.
4. Eastern, power boats, Marblehead.
6. Eastern, start of ocean race, New York to Marblehead.
7. New York, Glen Cove series, Glen Cove.
9. New York, Glen Cove series, Glen Cove.
9. Boston, club race, Marblehead.
9. Riverside, L. I. Sound Y. R. A., annual, Riverside.

9. New York, Glen Cove series, Glen Cove.
9. Manhasset Bay, special club, Manhasset Bay.
9. Eastern, power boats, Marblehead.
9. Bay State, Mass. Dory Association, Revere.
11. Manhasset Bay, challenge cup series, Sand's Point.
12. Manhasset Bay, challenge cup series, Sand's Point.
13. Manhasset Bay, challenge cup series, Sand's Point.
15. Eastern, annual regatta, Marblehead.
15. Eastern, rendezvous for cruise.
16. Larchmont, race week, opening, Larchmont.
16. Atlantic, power boats, Sea Gate.
16. Eastern, cruise to Gloucester.
16. Winthrop, Mass. Y. R. A., Winthrop.
16. Swampscott, Mass. Dory Ass'n, Swampscott.
17. Eastern, cruise to Isles of Shoals.
18. Larchmont, race week, Larchmont.
18. Eastern, cruise to Peak's Island.
19. Larchmont, race week, Larchmont.
19. Eastern, cruise to Booth Bay.
20. Larchmont, race week, Larchmont.
20. Eastern, cruise to Islesboro.
21. Larchmont, race week, Larchmont.
21. Eastern, cruise to Bass Harbor.
22. Larchmont, race week, Larchmont.
22. Eastern, cruise to Bar Harbor.
23. Corinthian, club race, Marblehead.
25. Larchmont, race week ends, Larchmont.
23. Hartford, L. I. Sound Y. R. A., special, Fenwick.
23. Manhasset Bay, power boats, Manhasset Bay.
25. Eastern, regatta at Bar Harbor.
27. Boston, Mass. Y. R. A., Hull.
29. Boston, midsummer series, M. Y. R. A., Hull.
29. Quincy, Mass. Y. R. A., Hull.
30. Boston, midsummer series, M. Y. R. A., Hull.
30. Indian Harbor, L. I. Sound Y. R. A., annual, Greenwich.
30. Atlantic, power boats, Sea Gate.
30. Eastern, power boats, Marblehead.

### AUGUST.

1. Eastern, special open, Marblehead.
2. Boston, Mass. Y. R. A., Marblehead.
3. Corinthian, midsummer series, Marblehead.
4. Corinthian, midsummer series, Marblehead.
4. Royal St. Lawrence, Seawanhaka cup match, Lake St. Louis, Canada.
4. Mass. Racing Dory Association, Marblehead.
5. Corinthian, midsummer series, Marblehead.
5. Royal St. Lawrence, Seawanhaka cup match, Lake St. Louis, Canada.
5. Mass. Dory Racing Association, Marblehead.
6. Corinthian, invitation race, Marblehead.
6. Royal St. Lawrence, Seawanhaka cup match, Lake St. Louis, Canada.
6. Hempstead Harbor, L. I. Sound Y. R. A., annual, Hempstead Harbor.
6. Shelter Island, L. I. Sound Y. R. A., annual, Shelter Island.
6. Larchmont, power boats, Larchmont.
6. Mass. Dory Racing Association, Marblehead.
6. Manchester, Mass. Y. R. A., West Manchester.

9. Manchester, Crowhurst cup, West Manchester.
10. Boston, club race, Marblehead.
11. East Gloucester, Mass. Y. R. A., Gloucester.
11. New York, special races, Glen Cove.
11. New York, rendezvous for annual cruise, Glen Cove.
12. Annisquam, Mass. Y. R. A., Annisquam.
12. New York, annual cruise to Morris Cove.
13. Annisquam, Mass. Y. R. A., Annisquam.
13. Horseshoe Harbor, L. I. Sound Y. R. A., annual, Larchmont.
13. Bridgeport, L. I. Sound Y. R. A., annual, Black Rock.
13. New York, annual cruise to New London.
13. Annisquam, dory races, Annisquam.
14. New York, annual cruise at New London.
15. New York, annual cruise to Block Island.
16. New York, annual cruise to Vineyard Haven.
17. Corinthian, club race, Marblehead.
17. New York, annual cruise to Newport.
18. Eastern, special open, Marblehead.
18. New York, special races, Newport.
19. Eastern, special open, Marblehead.
19. New York, Astor cups, Newport.
20. Boston, club race, Hull.
20. Huguenot, L. I. Sound Y. R. A., annual, New Rochelle.
20. Northport, L. I. Sound Y. R. A., annual, Northport.
20. Hartford, L. I. Sound Y. R. A., special, Fenwick.
20. New York, start of ocean race, Newport.
20. New York, steam yacht races, Brenton's Reef.
20. Brooklyn, power boats, Gravesend Bay.

## The Kingstown Water Wags.

BY THOMAS B. MIDDLETON, PRESIDENT OF THE ASSOCIATION.

THIS club claims the honor of having conceived and launched "the one-design class" of racing.

The one-design idea, which has now been so largely adopted for yacht racing purposes, was, on the other hand, the origin of "The Water Wags," and they have ever since devoted all their energies to the promotion of that division of racing.

It came about in this way. In the year 1887 "the plank-on-edge type" had well nigh brought yacht racing in the open classes to as low an ebb as it is to-day.

The type had become so pronounced that it was almost as easy to sit astride a five-tonner as a dray horse, the consequence being that as soon as a boat was beaten in a race she fell ninety per cent in value, and, except for her lead keel, was not worth the cost of breaking up. Only very rich men would consequently build, and the racing got very sick.

The Yacht Racing Association then called their experts together to see what was wrong, but they either did not see or would not recognize the real cause of the disease, and they tried to bolster up the patient by a radical change in the measurements. This had the effect of taking the plank off its edge and putting it on its side. It produced a fairly healthy boat for a few years and the sick lady got well enough to be able to get up and let her bed be made and to even make a fair show at the regattas for several seasons, but the ingenuity of the designers soon exaggerated the new boat into a skimming dish with a deep keel and interior taken up with braces and cross girders, carrying an enormous sail area and costing a fortune.

This type of craft was of no use except for racing (there was not head room to stand up in even a twenty-tonner of the ultra type), so that the depreciation of capital upon defeat soon rose to the old rate of eighty-five or ninety per cent. And those costly machines, plus golf plus motor cars, have thrown the poor lady into such a relapse that it looks very like as if she was about to relinquish the briny to her younger sister, who now has her hair up, is a great favorite, and has waltzed right around the globe.

The writer of these lines was confident his diagnosis of the elder sister's complaint in 1887 was correct, and

on, but the one-design classes have become so numerous that they have got almost as many orders from them as they have got for the last few years for boats in the open classes.

Then, again, men with money have their knife in the one design, because it makes the man with moderate means equal to him. They say they would not be

Just after the start.

bothered racing in a class where every detail is tied down and there is no room for "improvement," which means altering a healthy model into a racing machine. What Mr. Croesus wants is to know that his money has secured for him a ship that, before she leaves her moorings, everyone knows for a certainty that she will get into first place and stay there. That he will head the procession and look back at the poor beggars that cannot afford to out-build him, and that if anyone should, he will build a more advanced machine that will beat the boat that had the audacity to beat him. But is that true sport? Is it as true sport as a race where all the fleet go out like a flock of birds and where

Water Wags Racing in Kingstown Harbor.

A Water Wag Under Sail.

that the Yacht Racing Association was at sea on the point, and to prove it he determined to try his remedy. He accordingly selected the smallest possible sailing boat—a 13ft. dinghy of a useful and pretty double-bowed Scotch model, with a good beam (4ft. 10in.), carrying a well-cut lug by Lapthorn of 75 square feet—and induced six or eight other men to build boats similar in every respect. The original boats were mostly built by McAllister, of Dunbarton, N. B., though subsequently many other yards turned them out. They cost at that time about £14 or £15, being strongly built of yellow pine with teak fittings, and gave capital sport, the contests being very close and entirely one of skill in management, and after three or four seasons racing the owner, if he wished to sell his boat, got his money back. In proof of this, the writer's boat, the Eva—the first water wag ever built—sold last year for more money than she originally cost, after sixteen years' work.

The water wags were a success from the first; there are twenty-four boats on the racing list this year, besides many old ones in commission round the coast. (Fourteen boats came to the line on the 16th inst., the first race of this season, and seventeen on the 23d inst.) They have gone out to Japan, Hong Kong, the Persian Gulf, Buenos Ayres, Africa, and many other foreign stations.

"One-design" classes have also been organized in nearly all British waters. There are many of different sizes in the Solent and along the south coast of England. The Clyde, in Scotland, also possesses many, the largest running up to twenty tons. Belfast Lough, Ireland, also has its classes, and the Dublin waters started no less than seven classes besides the original water wag class—all healthy, good models, that make useful boats when not racing; the 25ft. water-line class being a particularly nice model of a cutter of about six tons, with standing head room in the cabin. They make delightful cruisers for two or three and a hand, will go through any weather, cost between £250 and £300, and do not depreciate ten per cent when sold second hand. His Excellency the Lord Lieutenant for Ireland built one last year and raced her through the season. All the races are very keenly contested, the boats being always close together, and every little advantage must be secured to win.

Of course, the one-design idea being so successful, could not expect to escape criticism and hostility from many quarters. First, the designers felt sore that one design should suffice for a class and not be "improved"

are republican or democratic in their ideas. Social position, politics or religion are inadmissible considerations. They simply confine themselves to their object: "The promotion of amateur seamanship and racing in safe and useful boats that are similar as regards size, lines and sail area, and where the contest shall be one

of skill." (It would be better for Ireland if her public bodies acted on the same lines and confined themselves to the objects for which they were formed.) Good fellowship and honorable sportsmanship are the principal qualifications for membership. The Water Wags do not go in for gilded figure-heads, judging from their president, re-elected for many years. Their burgee is red white red horizontal, with the red ensign. For several years they have held a very successful function in the shape of a smoking concert, at which many good photographs taken during the season are thrown on a screen, and they sometimes have an excursion in fleet for lunch in some bay or on some island.

The water wags have the name among land-lubbers of being dangerous boats. In unskilled hands they will, no doubt, upset in a squall, as any other 13ft. unballasted boat with 75 square feet of sail over will do, but they have the grand quality of not going to the bottom and leaving the crew to swim for it. All the crew has to do is to remain quiet till help comes, and even non-swimmers get out all right. There have been many upsets during the sixteen years' racing. On the first race of 1903, during a fierce squall, four of the boats were over at the same time, but all crews were picked up and the boats righted within twenty minutes. It is not a good thing to boast, but the water wags have never lost a man, and when it is considered that an average of eleven boats starting with two men on board in an average of forty races in the season, giving nearly 15,000 times men have risked their lives racing in these boats since they came into existence, besides a greater number of times when not racing, water wagging compares very favorably with other modes of ending one's existence.

Although this is an account of the club, and not of the members, it would not be complete without some mention of those members who have done most to make the club a success. Foremost among these is the former Honorable Secretary Mr. John B. Stephens, who took over his arduous duties when the club was at a low ebb and worked it up to a spring tide level, inaugurating and working with great success the smoking concerts which bring the members together in the off season. Mr. G. A. Newson, the present honorable secretary, has brought the club to a record pitch of perfection. Mr. J. H. Hargrave, ex-captain, brought untiring skill and energy into the working of the de-

"Neck-and-Neck."

tails of the club, and is the father of the square-sterned boat, introduced some years ago in place of the double-bowed model originally adopted. Mr. J. J. Lynch, captain for 1903, furthered the popularity of the club and arranged a most successful expedition to the Shannon, where the boats at the local regattas there created much interest. Mr. Luis Meldon, one of the most successful, if not the most successful water wag racer, while he was at it, is one of those universal geniuses who shine at whatever they take up. He is also a most successful amateur photographer, and most of the photographs of wags illustrating this article are by him.

The Water Wags being inaugurated in the year of the late Queen Victoria's first jubilee (1887) they possess a jubilee cup which is held each year by the most successful boat, and, though the metallic value of it is not much, it is increasing every year in intrinsic value, as it carries the names of the holders from the first year, several of whom have departed to sail in higher latitudes, and it is hoped that eventually it will be included among the nation's trophies.

Perhaps at some future date American and British or Irish amateurs will arrange a national seamanship apart from yacht building, in which event they could not do better than adopt the one-design class of boats for the contest, and in two boats identical in every respect, built side by side, either in America or England, the crews could race the best out of five races, changing boats for each race. As a seamanship championship it would be very interesting. It could be contested in inexpensive and useful boats that would sell well after the race.

As a primer school for amateur yachtsmen there is no better than the water wags, as all the rudiments of fore and aft sailing, rules of racing, and much general nautical knowledge are acquired in those small open boats, which knowledge comes in very useful as the yachtsmen rise up into larger classes, as they invariably do.

KINGSTOWN, Ireland.

HOUSEBOAT ROXANA TO BE LENGTHENED.—The steel houseboat Roxana, owned by Mr. John W. Gates, is now at Morris Heights, where she will undergo extensive alterations. The yacht will be cut in two amidships and 15ft. will be added. The deck house will also be lengthened, and when finished will contain a stateroom and a bath for the owner. The work will be rushed, and the yacht will be in commission on June 1.

A Water Wag on the Beach.

## Gas Engines and Launches.

BY F. K. GRAIN.  
(Continued from page 195.)

### Igniters.

IGNITING devices now employed are universally the electric ignition, that is to say, the charge of gas in the cylinder after being compressed is ignited by means of an electric spark, the spark being produced either from batteries or a mechanical generator. When electric ignition was first used the method of producing the spark was by having two parts, one of which was insulated, come in contact and separate with a wiping motion. Owing to the wear on the contact points and the difficulty of keeping the time of ignition the same, this plan was abandoned in favor of the popular method now in vogue called the make and break, or sometimes the hammer sparker. This device consists of first an electrode containing the contact point being insulated from the engine, usually by mica, the other part being a rocker shaft with an elbow inside of the cylinder, this elbow being actuated from the outside by various methods, but alike in the result, and the general mechanical movement is brought into contact with the electrode point, closing the circuit; then at the right moment the reverse motion is imparted to the rocker shaft separating the contact point when the spark is produced. This method of ignition is very simple, and as the duration of the contact or closing of the circuit can be made very short, it is probably the most economical on the battery power of any method. We have still another device, and one almost universally employed on automobiles, called the jump spark. In this device we have a firing plug containing two insulated points separated about 1-16 of an inch. On breaking the circuit, a spark jumps between these two points; to produce this result we have, as with the make and break spark, a primary battery from which the current passes through an induction coil thence to the plug. The flow of the current being controlled by what is called the commutator, placed on the main shaft, which, being insulated, does not allow a current to enter the coil until the right moment, and then broken by separation on the commutator by a simple mechanical movement. Of course, with the first named, or hammer brake, we employ a spark coil which is known as a low tension coil, whereas with the jump spark the coil employed is of high tension, and a current is produced of very high voltage. One of the objections to the jump spark is that the plug is liable to become short-circuited from soot or oil, and the current being of high tension, great care must be exercised in insulating all parts, especially the wiring, as the current will jump through quite a space from one conductor to another.

While this method of ignition has a great many features which recommend it, on account of there being no mechanical movements necessary in the cylinder, it has not proved a success in marine work, as the dampness seriously affects the coil and produces short-circuits, and it is absolutely fatal to have the outfit get wet.

We will now go back to the outside mechanical movement of a hammer brake. In the two-cycle engine and also the four-cycle, the rocker shaft and the electrode employed are usually of similar design. And right here let us say that the sleeve or bearing through which the rocker shaft passes should in all cases be of bronze to prevent rust and corrosion. In order to actuate the rocker shaft, it is forced into contact by some kind of a catch or dog which is spring-cushioned from a rod working from either an eccentric or cam movement. When the contact is complete the separation is made by a part being allowed to fall and strike a hammer blow with a spring of some kind to assist it. This gives a quick and positive separation of the points, and of course can be timed exactly, and not influenced by the speed of the engine.

### Batteries and Electric Generators.

In mentioning batteries, we would say that the kind now universally used are known as the dry battery, and can be purchased at most any hardware store. Of course, like other goods, they vary in quality. The number employed for ignition purposes is generally from six to eight cells. These cells give from 1 to 1½ volts. Other and more expensive batteries are the wet variety, which, without doubt, will give better results in constant service, but in cases where the ordinary dry battery will not answer, we prefer to use a mechanical generator—that is, either a magneto or dynamo—using the batteries only for starting, and in this way they will last a long time.

Mechanical generators mentioned are of two types—the magneto having an armature with a fixed magnet, the dynamo having an armature and field magnet. The results obtained from either machine being of course alike, in general results, it is more a question of individual fancy as to which is the best to employ. The magneto has the advantage in this, that it can be operated at a greater range of speed than the dynamo, which machine, if over speeded, will burn out the field winding. But, on the other hand, the dynamo, as usually wound, will operate very successfully without a spark coil, which the magneto requires. The magneto also is liable to lose its magnetism, it being a fixed magnet. We are sorry to say that, owing to competition, some makers of the magnetos are not over particular in the quality of their magnetos, which on these machines is one of the most important parts.

While on this subject we would mention the method employed for giving the generators their rotary motion, which is either by a friction wheel directly on the armature shaft or a belt wheel, both being driven from the fly-wheel of the engine. While the friction wheel is a very neat device, we cannot recommend it, as, unless set perfectly true with the fly-wheel, there is a slight friction, which, although imperceptible, rapidly wears the friction wheel, and if any oil or water gets on to the fly-wheel, it allows the friction wheel to slip, of course causing the engine to miss fire.

Both these objections are overcome by using a good belt, preferably a flat one, which in all cases should be endless, having the joint neatly sewed together, otherwise the jolt where the belt is laced passing over the pulley of the generator will not only mark the commutator, but wear the bearing.

## Brooklyn Y. C.'s Ocean Race.

THE details that are to govern the Brooklyn Y. C.'s ocean race have been arranged for. The contest will be started on Saturday, July 2, off the Brooklyn Y. C., Gravesend Bay, Long Island, finishing off Marblehead Rock, Marblehead, Mass. The distance is about 330 miles, and there will be no time limit.

The conditions governing the race follow:

The race is open to cruising-sailing boats belonging to any organized yacht club in the world, not measuring more than 40ft. over all. Any rig.

Boat to enter must be a bonafide cruising vessel, having full deck, water-tight cockpit, and of substantial construction and rig. Yachts built to any special racing class, or that are used solely for racing, or yachts having bulb keel or metal fin which is not an integral portion of the hull are barred.

Crew limited to five, all amateurs. One professional may be carried as steward or cook, but must do no work on deck, nor assist in any manner in navigating the vessel.

Boats must carry stores and water sufficient for ten days. Not less than one-half gallon per day per man of water to be carried. This may be carried in tanks or breakers at the captain's option.

Anchors, chain or hawsers, side-lights and complete cruising outfit must be on board, including two compasses, one for use in binnacle, and a small spare one in reserve; also a life-preserver or ring for each member of the crew.

Boats measuring more than 30ft. over all must have a tender or dinghey not less than 10ft. long; boats under 30ft. over all one not less than 8ft. long.

No restrictions as to light sails carried, but the lower canvas must be that used by the yacht when cruising.

Towing by rowing dinghey and rowing with sweeps will be permitted.

The shifting of weight fore and aft to trim the vessel will be allowed, but no weight in the form of ballast or stores must be jettisoned except as a measure of safety.

Before starting the committee will inspect each yacht and decide as to its right to participate in the race. All entries are accepted conditional to this inspection.

Before starting, the captain of yacht must satisfy the committee that he has on board charts, compasses, lead-line, lights and proper sailing directions; also a log-book, which must be kept with hourly entries, and handed in at completion of race.

The committee reserves the right to refuse the entry of any boat that they do not consider a bonafide cruising craft, or that is, in their judgment, unseaworthy or otherwise unfit to make the race.

Measurement for computing allowance will be the length of the boat over all—i. e., the length on deck from the fore-side of the stem to the after-side of the stern-board or transom.

Allowance per foot, 40 minutes. No allowance for difference of rig.

Entries must be made before 12 o'clock noon, June 18. Entry blanks may be had by applying to D. G. Whitlock, 51 Wall street; Charles A. Kelly, 21 Park Row; Thos. Fleming Day, 9 Murray street, New York city.

Three prizes are offered, which are as follows:

First Prize—A 50-guinea cup presented by Sir Thomas J. Lipton.

Second Prize—If three or more boats start, a \$200 marine painting, presented by Warren Sheppard, Esq.

Third Prize—If five or more yachts start, a \$75 Chelsea ship's bell clock, presented by The Rudder Publishing Company.

Also a prize to be given under conditions not yet formulated by G. R. Agassiz, Esq.

## Corinthian Y. C.

ESSINGTON, DELAWARE RIVER,

Saturday, April 30.

The first race for the new class of one-design dories was held on Saturday, April 30. Seven boats started and all finished. Mr. W. Barklie Henry's boat got the start and was never headed. The course was a triangle formed from the anchorage off Essington to Darby Creek, to the lower end of Tinicum Island and return.

The summary follows, start 3:55:

	Finish.	Elapsed.
No. 2, E. Walter Clark.....	5 23 00	1 30 00
No. 6, W. Barklie Henry.....	5 23 00	1 30 00
No. 10, F. R. Hoisington.....	5 18 00	1 33 10
No. 12, J. Murray Watts.....	5 28 12	1 38 12
No. 1, Dr. Root G. Le Conte.....	5 29 30	1 34 30
No. 6, Mayor Weaver.....	Not timed.	
No. 3, Estey Brothers.....	Not timed.	

**MOKI SOLD TO A SOUTHERN YACHTSMAN.**—The fourth crack racing sloop of the Inland Lake Yachting Association has been sold to Southern yachtsmen, and will go to the Gulf coast at once. The last purchase being the Jones & Laborde production Moki, which represented Nodaway Y. C., of Neenah, Wis., in the association championship races last August, she finishing fourth in the percentage list. Moki was sold by Commodore J. C. Kimberly through the agency of L. D. Sampsell, of New Orleans. She will represent the Gulfport (Miss.) Y. C. in the championship races of the Southern Gulf Coast Yachting Association for a class of Seawanhaka cup type of boats.

**AUXILIARY SCHOONER ARCTURUS CHARTERED.**—Mr. Frederic Gallatin has chartered the auxiliary schooner Arcturus from Mr. Rutherford Stuyvesant, through Messrs. Tams, Lemoine & Crane. Arcturus is 169ft. over all, 135ft. waterline, 27ft. 2in. breadth, and 13ft. draft. She was designed by Mr. St. Clare Byrne, and built by Messrs. Ramage & Ferguson at Leith, Scotland, in 1896.

**KANAWHA SOLD BY GOVERNMENT.**—The steam yacht Kanawha, the first of that name, has been purchased from the United States Government by Mr. H. C. Baxter. She was purchased by the Government at the outbreak of the Spanish war from Mr. John P. Duncan.

## Boston Letter.

BOSTON, May 9.—At the annual meeting of the Manchester Y. C. the following officers were elected: Com., Edward S. Grew; Vice-Com., S. Parker Bremer; Rear-Com., E. A. Boardman; Sec'y and Treas., Horace B. Pearson; Meas., David Fenton. Regatta Committee—R. DeBlois Boardman, chairman; Reginald Boardman, George Lee, Norton Wigglesworth and Horace B. Pearson. It has been announced by the House Committee that the club house will be kept open from 8 A. M. until 10 P. M., and that an expert steward has been secured, so that members and visiting guests may obtain suitable meals on race days and other times. The following is the list of fixtures for the season:

July 5, Tuesday—First championship race.

July 18, Tuesday—Second championship race.

August 8, Monday—Y. R. A. open race.

August 9, Tuesday—Crownst cup open race.

August 16, Tuesday—Third championship race.

August 22, Monday—Handicap club race.

September 5, Monday—Handicap club race.

In connection with the club championship races there will be club handicap races, to be announced later. A number of handsome new cups have been presented, and it is proposed to make this season one of the liveliest in the annals of the club.

The steam yacht Wakiva, owned by the estate of the late W. E. Cox, has been chartered to Mr. L. V. Harkness, of New York. She is now fitting out at the Baker Yacht Basin, in charge of Capt. L. A. Spinney, and is to be delivered at New York by June 1. The Wakiva was designed by Messrs. Cox & King, of London, and built last year by Ramage & Ferguson, at Leith. She is 192ft. over all, 159ft. 8in. waterline, 25ft. beam and 11ft. 3in. draft.

Mr. Henry A. Morss, of the Special Ocean Race Committee of the Eastern Y. C., has announced that classes will be provided in the ocean race for schooners of more than 50ft. waterline. The number of these classes will depend upon the number of yacht owners who desire to enter. The total number of entries received by Mr. Morss so far is 19. The House Committee of the Eastern Y. C. has announced that the club house at Marblehead will be opened for the season May 26, under the superintendence of Mr. George W. Crocker. It is proposed to have music Thursday evenings during July and August, provided for by subscription fund. Arrangements have been made for the care of private boats and bicycles, and for yacht supplies, water, laundry, telephone, etc.

The 25ft. power launch, Minnie T., owned by Mrs. John N. Taylor, of Dorchester, was launched at Murray & Tregurtha's last Thursday. This launch will be used on Lake Cobbosseecontee, Me., where Mrs. Taylor has a summer estate, for fishing trips. The launch will sail for Hallowell some time this month, from which point she will be taken overland to the lake.

Messrs. Murray & Tregurtha are building a 38ft. gasoline launch for Mr. R. W. Emmons, 2d, of the Beverly Y. C. She will be fitted with a navy awning and spray hood. She will be used in Buzzard's Bay. This firm has sold the gasoline launch owned by Dr. C. A. Rabethge, of Boston, to Mr. Halsey Chase, of Prudence Island, R. I.

The 21-footer which Messrs. Small Bros. have designed, and which is now building at Lawley's, is for Commodore E. P. Vilas, of the Milwaukee Y. C. She will be called Mendota. Messrs. Small Bros. also have an order for a 21-footer for Mr. John R. Cotter, of Bay City, Mich., which may be raced for the Walker and Lipton cups. They have designed a 36ft. launch for Mr. W. E. C. Eustis, of the Beverly Y. C., which will probably be built at Monument Beach. They have sold the 21-footer, Rooster II, owned by Hon. Charles Francis Adams, 2d, to Mr. William F. Nash, of the Lake-wood Y. C., Rocky River, O.

At the yard of Mr. James McIntyre, Neponset, the 22-footer, Clothe, owned by Commodore B. P. Cheney and Mr. C. D. Lanning, of the Boston Y. C., is being changed from centerboard to keel. It is figured that by this change she may be made to measure into the class, which she was unable to do last season. At the same yard the 18-footer, Patrice II, built from Messrs Small Bros' design, has been finished.

Mr. W. J. Edwards, of South Boston, has designed and will build a 30ft. launch for Mr. T. T. Beers, of New York.

Last Wednesday the steam yacht Anona, built from designs by Mr. Fred D. Lawley for Mr. Paul Rainey, of the New York Y. C., was launched at the Lawley yard. The yacht was christened by Miss Ethel Chapin, of Providence, R. I. Anona is plated with steel on the raised and sunken system. She is 138ft. over all, 110ft. waterline, 17ft. 6in. beam, and 7ft. 6in. draft. Her depth of hold is 10ft. roin. She has a triple expansion engine of 500 horse-power, with cylinders roin. by 15in. by 24in., with a 14in. stroke. It is estimated that her speed will be 12½ knots. She has two deck houses, mahogany outside and mahogany in antique effect inside. The forward deck house contains the dining saloon and pantry. There is a separate ice-box in the pantry and a dumb waiter connecting with the galley. The after deck house is used as a social hall, and from this entrance is gained to the owner's quarters below, which consist of four staterooms with two baths. A complete telephone system is installed, and the yacht will be lighted by electricity. There is no ice-making machine, but in lieu of this there is an ice-box below decks with a capacity for three tons. There is sufficient coal capacity in the bunkers for 1,200 miles. The Anona will carry a crew of fourteen, under command of Capt. John Thompson.

JOHN B. KILLEEN.

**STEAM YACHT KALOLAH SOLD.**—Mr. Albert H. Schmidt, of Detroit, Mich., has purchased from Mr. Dumont Clarke the steam yacht Kalolah, through the agency of Mr. Stanley M. Seaman, New York. Kalolah is a flush-deck boat, designed and built by the Herreshoff Mfg. Co., 1893. She is 93ft. over all, 78ft. waterline, 13.9ft. beam, 5ft. draft; double planked, with steel reinforcements, and has triple expansion engine and Almy boiler, giving a speed of 12 miles an hour. The yacht is now in Tebo's Basin, in charge of Capt. J. J. Klintworth, Detroit. She will leave for the West just as soon as the Erie Canal is open for navigation.

## Designing Competition.

### Third Prize.

THE third prize in our designing competition for a 40-foot water line cruiser was awarded to Mr. Alfred E. Luders, of New York city.

The design shows a very good boat with many commendable features. The cabin plan, however, deserves particular attention, for the interior arrangement could hardly be improved upon. Mr. Luders made the mistake of crowding too much into the forward part of the boat, and in actual practice the quarters would not be comfortable or livable. The forward stateroom opening from the saloon and the captain's room are hardly necessary. If these were removed and the galley run the full width of the boat the interior would be ideal in its arrangement. In order to get well-cooked meals the galley must be roomy and well ventilated, with full head room throughout, and in order to have a contented crew their quarters must not be crowded and dark.

The after part of Mr. Luders' cabin arrangement is quite the best we have ever seen in a boat of this size. The saloon, the staterooms, the steerage and lavatory are all roomy, well arranged and finely ventilated. The arrangement of these quarters is capital, the access in every case is good and they bear proper relation one to the other. If berths were wanted in the saloon the transoms could be drawn toward the center and berths placed behind.

The idea in view in the design was to make comfort a feature of the boat. As the boat was probably to be

## Southern Letter.

NEW ORLEANS, May 5.—The Associated Press dispatch from Boston the other day giving the news that the celebrated champion cabin sloop Calypso had been purchased by a member of the Southern Y. C. was grand news indeed to the boat lovers hereabouts. It was known that some of the fastest small racing craft in the country had been bought by residents of this city, and that the racing among the little fellows would be all that could be desired, but at the same time it was realized that there would be much wanting if there was not some new life and spirit infused into the large racing-cruising cabin classes. It was considered that if some patriotic yachtsman would bring down from the north one of the better kind of modern cruisers, like Calypso, that a splendid example would be set, and others would be drawn into the game. This hoping, waiting, expectancy state of the local enthusiasts was brought to terminate in a joyful realization when it became known that the Calypso would be added to the fleet of this section, she being known to many southern yachtsmen as the most satisfactory type of fast, able, comfortable sailing yacht that could be produced.

The purchaser of the Calypso was Commodore Sam F. Heaslip, now a member of the governing committee of the Southern Y. C., vice-commodore of the Pass Christian Y. C., and one of the leading promoters of the sport of yachting here for many years.

Commodore Heaslip has had the well deserved reputation of being one of the foremost yacht skippers the South has ever known. He has owned and sailed many

championship of the Y. R. A. of Massachusetts in her first year, 1901, and she held it again in 1902. Last year she was not raced much. In 1904, in fulfilling the promise for which she is brought south, this celebrated craft should experience one of the most active seasons in her career, for it is the intention of her new owner to race her in all the events in which she can enter.

L. D. SAMPELL.

## Rhode Island Letter.

PROVIDENCE, R. I., May 7.—At the opening meeting of the Narragansett Bay Yacht Racing Association, held recently, the following schedule was arranged for the annual week of open racing:

Monday, August 15—At Edgewood Y. C.

Tuesday, August 16—Bristol Y. C.

Wednesday, August 17—Fall River Y. C.

Thursday, August 18—Conanicut Y. C. or Association race at Jamestown.

Saturday, August 20—Rhode Island Y. C. at Potter's Cove.

These races are all open to members of any recognized yacht club, and will be sailed under the association rules. Suitable prizes will be offered in each class each day, and a "cock of the walk" pennant will be awarded in each class to the boat scoring the largest percentage in the week's racing.

Communications relative to the race week should be addressed to the secretary of the association, Thomas L. Bartlett, P. O. Box 327, Fall River, Mass. Measurements each day will be made by the measurer of the club under

DESIGNING COMPETITION—THIRD PRIZE DESIGN—PLANS OF SLOOP AND YAWL RIGS.

Submitted by A. E. Luders, New York City.

owned jointly by the party it was deemed advisable to have a separate stateroom for each, using the main saloon for sleeping purposes only in an emergency.

A combined chart room and vestibule was laid out as a handy place to shed wet oilers and stow some toilet arrangements to be equally accessible to deck or saloon. Guns handy to companionway.

Sailing master to have a stateroom and two hands berth in forecabin, comprising the three men to handle boat, as called for. Cook to berth in forecabin—extra berth can be located in forecabin or galley, if wanted.

The dimensions are:

Length—	
Over all .....	61 ft. 10½ in.
L.W.L. ....	40 ft.
Overhang—	
Forward .....	9 ft. 9¾ in.
Aft .....	12 ft. ¾ in.
Breadth—	
Extreme .....	15 ft. 2½ in.
L. W. L. ....	14 ft.
Draft—	
Extreme .....	6 ft.
Sail area—	
Sloop rig .....	1,990 sq. ft.
Yawl rig .....	1,876 sq. ft.
Displacement .....	21.75 tons.
Fixed ballast .....	8.50 tons.
Trim ballast .....	1.00 ton.

The weights of boat are divided approximately, as follows:

Hull .....	6.37 tons.
Furniture .....	1.88 tons.
Outfit and equipment .....	.39 tons.
Sails and spars .....	.72 tons.
Tanks .....	.07 tons.
Ballast, total .....	9.5 tons.

Total .....

The above is boat in light condition; by adding 2.32 tons of stores, crew, passengers and effects we get 21.75 tons, the designed displacement for 40 ft. W. L. Extra stores for deep sea cruise will, of course, sink boat beyond 40 ft. W. L.

interesting boats, the most noteworthy of these being the long-to-be-remembered schooner Viola. Last summer Commodore Heaslip brought South the remarkable little open sloop Gladiola, ex-Galatea, of the Oconomowoc Y. C., more for the purpose of doing a little missionary work than for anything else. Gladiola did as he expected—she opened the eyes of our yachtsmen to the fact that there was a new and better order of yachting ruling elsewhere, for her speed was astonishing, and her build and finish of a quality unapproachable to builders of this part of the country for some time to come. Last summer, after Gladiola had done here what had been intended of her, her owner promised that he would try to do as much for the larger classes of yachts, and would endeavor to add to the fleet an example of what an up-to-date fast cruiser should be. All winter long he has devoted considerable time to selecting the boat which he considered would best advance the interest in yachting here.

Calypso was only beaten by a few seconds by the most extreme freak racing machine that could be devised. The rules of the Southern Y. C. and of the Southern Gulf Coast Y. A. were formulated, as have been the latest rules at Boston and in many other localities, for the express purpose of shutting out the cabin sloop racing machines.

Calypso is 42 ft. over all, 25 ft. waterline, 12½ ft. beam, and she draws 2½ ft. of water. With centerboard down she has a draft of about 8 ft. She is a grand boat to windward, and it is expected that she will be a revelation in this respect here. She is excellently sparred and rigged, and her sails were made by Wilson & Silsby. She carries 1,250 square feet of sail in mainsail and jib. She has a "pole mast rig" without topmast or topsail, the only light sails carried being spinnaker, reaching jib and balloon jib. All her cabin trimmings are mahogany, and the fittings, cleats, blocks, etc., are polished brass. Her cockpit is about 10 ft. long. The cabin is over 12 ft. in length, and it will sleep four or five persons. There are large lockers, a closet, galley with cooking outfit, stove and ice-box, while the forecabin contains ample room for a paid hand.

Calypso was designed and built by Chas. C. Hanley, of Quincy, Mass., in 1901. Hanley has the reputation of being one of the best modelers and builders of centerboard boats of moderate size in the country. Calypso won the

whose auspices the race is sailed, but any disputes concerning the same will be referred to the official measurer of the association. The association has adopted a racing pennant to be flown at the main peak of every boat engaged in a race, and no time will be taken of any boat that fails to display the pennant throughout the race as prescribed. The pennant is a dark blue flag 18 in. by 24 in., with a 9 in. square white field in the center bearing a blue star. A representation of the pennant heads a card poster announcing the schedule of race week which has been sent to every yacht club on the New England coast.

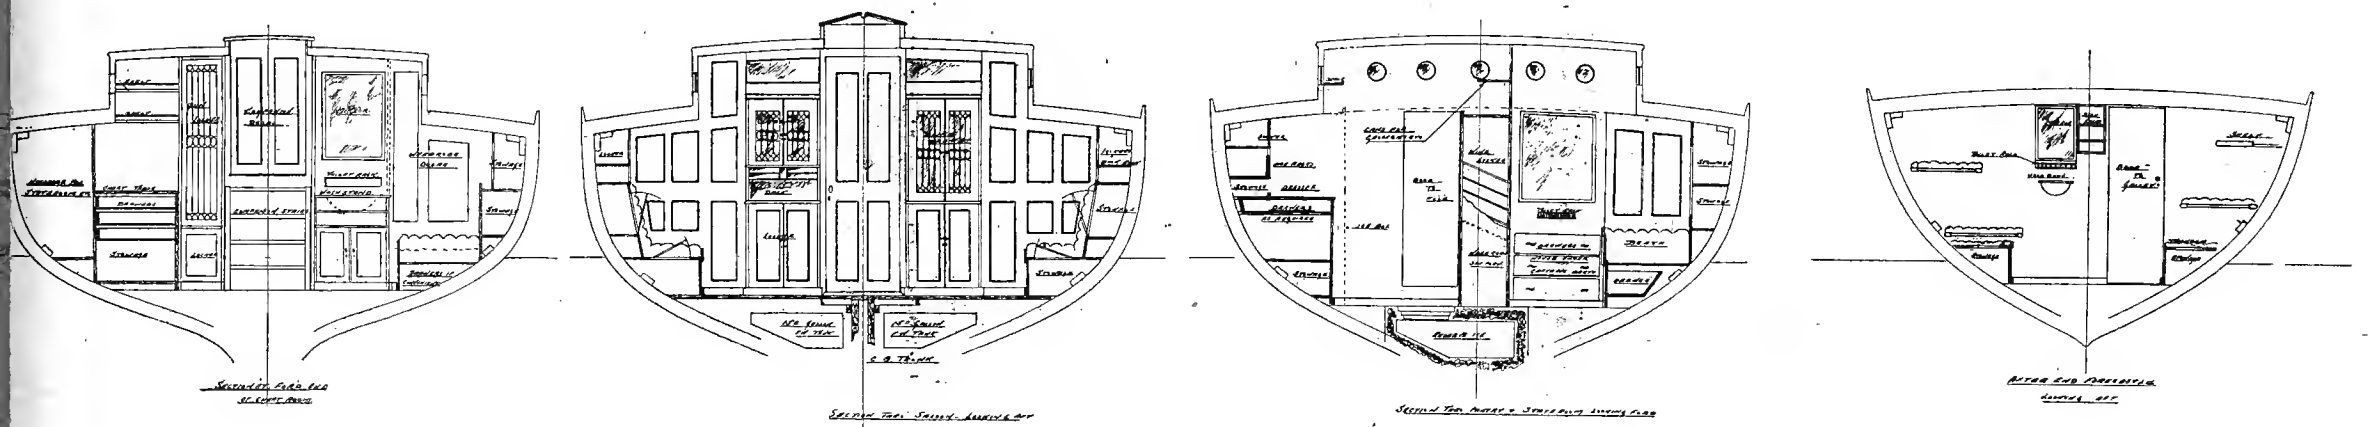

Each association race takes the place of one of the regular events of the club under whose auspices it is held. The only other fixtures for the season arranged as yet are the two other open regattas of the Bristol Y. C. scheduled for June 25 and September 10, and the Memorial Day open regatta of the Fall River Y. C.

The Edgewood Y. C. has established "cock of the walk" pennants for the club boats in each class that win the most victories in any regular races during the season. As last year, the greatest racing interest on the upper bay this season is likely to center in the performances of the 30 ft. cats. There will be several new ones in this class, principal among them being Messrs. H. J. and D. W. Flint's new Wanderer III. With the series for the Commodore's cups at the Edgewood Club and the Washington Park Boating Association and several other special events, in addition to the various club regattas, the 30 footers will be busy this summer.

The annual cruise of the Rhode Island Y. C. will start July 24. The fleet will rendezvous at Newport, and during the week will visit Stonington, Watch Hill, Shelter Island and Block Island, something special in the way of entertainment being planned at each port. The usual prizes will be offered for each day's run from port to port. The schooner Rusalka will be the flagship of the Rhode Island Y. C. fleet this season, having been purchased by Commodore Rogers from the estate of the late Commodore Frank F. Olney. Rusalka was the flagship two years ago, prior to the reign of the Esperanza, formerly the first Ingomar, owned by Morton F. Plant.

Fleet Captain H. E. Barlow, of the Rhode Island Y. C., has bought the 25 ft. cat Lydia C. Mr. Charles G. Easton has bought the 25 ft. Gertrude, built by Crosby several years ago, and Mr. H. L. Hammond has acquired a new

DESIGNING COMPETITION—THIRD PRIZE DESIGN—LINES, DECK AND CABIN PLANS.  
Submitted by A. E. Luders, New York City.

30ft. auxiliary cat, bought in Newark, N. J. Mr. H. R. Dean, of Providence, has purchased through the agency of F. S. Nock the 30ft. sloop Ghost, built at Mystic, Conn., last year. Through the same agency the 30ft. cat Wanderer has been sold by the Flint boys to Mr. James Streat, of New York city. Commodore Peirce, of the Washington Park Boating Association has a new 33ft. cruising launch, the Isabelle, built by Palmer Bros. at Cos Cob, Conn., and equipped with an eight horse-power four-cycle Palmer engine.

For the fast 30ft. cat class of Narragansett Bay, Mr. B. B. Crowninshield has designed for Messrs. Harvey J. and Dutee W. Flint, of Providence, R. I., a new boat, which is now under construction by Messrs. Davis Brothers, at Warren, R. I. The boat will be called Wanderer III., and will replace the old cat Wanderer, which has been sold to a New York man, and will be seen in races at Barnegat Bay this summer.

Her dimensions are: Length over all, 38ft.; waterline, 21ft.; Beam, extreme, 11ft. 7in.; draft, hull, 4ft.; draft, board down, 10ft.; displacement, 12,000 pounds; sail area 960 square feet.

In designing the new Wanderer the idea was to produce a modern cruising and racing boat, high-sided, heavily constructed, and thoroughly strapped and braced.

Nothing that would produce a seaworthy and comfortable cruiser was sacrificed for the sake of gaining speed, and the owners will probably have an opportunity thoroughly to test her stanchness as they expect to enter her in the 330-mile outside race for the Lipton cup.

The boat is on entirely new lines for her class in these waters, but although there are many sloops of her design in Narragansett Bay, her performance under cat rig will be watched with interest by some of the old-timers who look with dubious eyes on long overhangs.

The boat is a combination keel and centerboard, having a heavy outside keel of lead. All the framing and timbers are of best stock oak. The keel is 12 by 12, and the frames are single pieces, extending the full width of the boat, of 1 3/4 in. stock, spaced 5 in. on center, forward and aft, and 8 in. amidships. The sternpost measures 9 in. by 5 in., and the stem 4 in. by 6 in. The planking is of 1 1/4 in. cedar. The three chain plates will extend clear under the hull from rail to rail, and will be of galvanized steel. Inside there will be several diagonal truss straps and braces of galvanized steel and Tobin bronze.

The hollow mast will be 8 1/2 in. in diameter at the deck and 43 ft. in height. The boom will be 36 ft. in length, and the gaff 25 ft. The sail is to be a Thompson 10-ounce special cross cut duck, and will have a hoist of 26 ft. The blocks will be of lignum vitae. All the cleats, turnbuckles and miscellaneous deck fittings will be of polished Tobin bronze. The mast is stepped about 8 ft. aft of the stem, and by a special device may be shifted some two feet further aft, giving sufficient room to carry head sails if desirable, and enter the contests for sloops. The three chain plates permit the shifting of the two side stays when this change is made. The mast is further secured by a fore truss stay in addition to the regular fore stay.

The cabin is 15 ft. in length, with 5 ft. 2 in. head room. Four permanent berths, each 4 ft. wide, will be fitted with spring beds and hair mattresses and in front of them are comfortable cushioned transoms. All the trim in cabin and cockpit, as well as the rails and sheer strakes, is of polished San Domingo mahogany.

F. H. YOUNG.

## La Parisienne II.

From The Yachtsman.

ALL British yachting men, we are sure, will cordially unite in congratulating Mr. Lorne Currie on his marvelous escape after the accident to the motor launch Parisienne II., which he was steering, at Monaco; while, at the same time, all will sympathize deeply with the unfortunate men who were more or less burned.

Mr. Lorne Currie has had more than one exciting experience in his yachting career, and not long ago his small racer capsized off Havre, and he was left swimming about for some time till picked up; but then he only had one element to contend with, i. e., water, whereas at Monaco there were two—water and fire.

It was expected that the racing for motor launches would provide some exciting sport, but the results have exceeded anticipation, and there have been a considerable number of breakdowns and minor accidents.

On the Wednesday, the Napier Minor suffered from a slight fire owing to the heat of the exhaust, but this was soon put out. On the Thursday, nothing unusual occurred, except that Parisienne II. lost one of her propellers; but on Friday the large racers were to start for a long race of 250 kilometers at 8:15 A. M. When the starting gun was fired punctually to time, out of the six boats entered, only four crossed the line—i. e., Pionitt IV., Dubonnet, Lutece, and Femina. The other two—Napier and Parisienne II.—were suffering from some trouble in the harbor. Napier, however, soon started, and went in pursuit of the others, and a little later Parisienne II. started, though it was easily seen that something was the matter, as she showed nothing like her usual speed. She had hardly got to the first mark when she was seen to burst into flames. What happened was told by the crew afterwards, and it appears that for the second time one of the three propeller shafts with which she is fitted had broken off—i. e., the starboard one—and steering was found to be rather difficult with only the two remaining ones. As they were reaching the first buoy, without the slightest warning, the forward part of the boat burst into flames, which soon swept aft from end to end; in fact, the main tank, which holds some 800 litres of petroleum, was ablaze. Seeing that the only chance was to jump overboard, Mr. Lorne Currie did so, calling on the others to follow him. As all the lifebuoys except one had been destroyed by the flames, the four men in the water had only this one means of support between them, but luckily there was a punt attached to the mark-buoy, to which they swam, and got on board. This punt was towed in part of the way by the motor launch Mercedes I., which immediately came to their assistance; but as her lowest speed was far too much for the safety of the punt, the latter was let go, and afterward towed in to Monaco by a tug, and the men

forward, who had been a good deal burnt by the flames, were sent to a hospital.

The still burning Parisienne II. was then towed ashore by a torpedo boat and a tug, and left burning on the beach.

The actual cause of the accident, from all accounts, appears to have been the breaking of the joint of a petrol pipe on to the main tank forward, and the petrol, being thus liberated, poured aft and became ignited, either by an electric spark or by some portion of the heated exhaust-piping. It appears that there were three separate pipes from the tank forward, leading the petrol to the three 80 horse-power Mors motors with which the launch was engined, and, as stated above, the junction of one of these pipes got broken, probably by the excessive vibration, and it is quite possible that the loss of one of the propellers would accentuate this vibration and cause it to reach a dangerous point. Be this as it may, the effect of continuous vibration on pipes and joints is one that will have to be carefully studied and guarded against in the future.

As the race had been stopped, owing to the accident, it was restarted at 10 A. M., and the five crossed the line—Pionitt IV., Napier, Lutece, Femina, and Dubonnet, the course being shortened to fourteen rounds of the hexagonal course marked out in the bay. After five rounds, Napier's pump gave out, and she had to return to harbor, following Femina and Pionitt IV., who, earlier in the race, had got something wrong and had to return, leaving Lutece and Dubonnet to fight it out to a finish. The race was easily won by Lutece.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

STEAM YACHTS CLAYMORE AND VIKING SOLD.—Mr. Jarvis B. Edson has sold the high speed steam yacht Claymore to Mr. Franklin Haines. Mr. Edson has purchased the steel steam yacht Viking.

SCHOONER ALSACIENNE CHANGED TO AN AUXILIARY.—The schooner Alsacienne, recently purchased by Mr. Archibald McNeill, of Bridgeport, Conn., is to be fitted with auxiliary power.

CORINTHIAN Y. C. ELECTION.—The annual meeting of the Corinthian Y. C. was held on May 2 at its quarters, foot of F street, northwest, Washington, D. C. The following officers were elected to serve during the ensuing year: Com., Ross L. Fryer; Vice-Com., Leslie F. Borland; Sec'y-Treas., Don E. Clark; Treas., J. Edwin Lawton; Board of Directors—David B. Glasco, Virgil C. Miller, Ernest Friess; Signal Officer, Benjamin T. Rollins.

BAY VIEW Y. C. OFFICERS.—At a recent meeting of the Bay View Y. C., the following officers were elected: Com., Edward R. Karutz; Vice-Com., J. Fred Borghard, Jr.; Rear-Com., George C. Miller; Fleet Captain, Harry Groth; Sec'y, Edward Effinger; Finan.-Sec'y, Paul Rosa; Treas., John Fraas.

BAYSIDE Y. C.'S ONE-DESIGN CLASS.—The members of the Bayside Y. C. are to have a class of one-design dories. Fifteen boats have already been ordered, and it is more than likely that twenty-five will be seen on the bay before the season is very far advanced. The boats are 18 ft. over all and 5 ft. breadth. They are being built by Emmons, of Swampscott, Mass.

AUXILIARY ENCHANTRESS REACHES NEW YORK.—The British-built auxiliary Enchantress that was purchased last year by Mr. N. L. McCready, arrived in New York from Cowes on May 5. She is 140 ft. over all, 124 ft. waterline, 20 ft. breadth, and 11 ft. 3 in. draft.

DR. WILLIAM BARTON HOPKINS DIES.—Dr. William Barton Hopkins died in Philadelphia on May 4. He owned the British-built yawl Caress, and was a member of the New York Y. C.

CORINTHIAN Y. C. ADOPTS NEW MEASUREMENT RULE.—At a meeting of the Corinthian Y. C., of Philadelphia, held at the club house at Essington, on April 30, the New York Y. C. measurement rule was unanimously adopted.

CHEEWINK III. PURCHASED BY NEW ORLEANS SYNDICATE.—The well known racing cabin 25-footer, Chewink III., of the Y. R. A. of Massachusetts, has been sold by Mr. F. C. Macomber, her owner, to a syndicate of New Orleans yachtsmen, with the proviso that she can be shipped to the Crescent City at once. There is some doubt about her being transported South, as she is said to be too wide to be carried by car, and almost too long for a steamer. It is probable that she will be shipped by a Morgan steamer sailing from New York May 25.

INGOMAR REACHES SOUTHAMPTON.—Mr. Morton F. Plant's schooner, Ingomar, arrived at Southampton, England, on May 5. She left Bristol, R. I., on April 20, and took 15 days, 9 hours and 25 minutes for the voyage.

EXPLOSION ON TARANTULA.—Three men were badly hurt on May 7 by the explosion of a battery on William K. Vanderbilt's British-built turbine yacht Tarantula, at Jacob's yard, City Island, where the yacht was anchored.

SLOOP AYLWYN SOLD.—Mr. A. H. Hagemeyer, of New York city, has sold the sloop yacht Aylwyn to Mr. Geo. H. Bartlett, of Greenwich, Conn., through the agency of Stanley M. Seaman; New York.

## Canoeing.

### Atlantic Division Camp.

ATLANTIC DIVISION ANNUAL CAMP, under the Palisades, opposite Riverdale-on-Hudson, May 28, 29 and 30.—The following programme of races, subject to change at the discretion of the regatta committee, will be held off the camp on Monday, May 30:

1. One-man, single-blade paddling, 1/2 mile straight-away.
2. One-man, double-blade paddling, 1/2 mile straight-away.
3. Tandem, single-blade, paddling, 1/2 mile straight-away.
4. Tandem, double-blade paddling, 1/2 mile straight-away.
5. Fours, single-blade paddling, 1/2 mile straightaway.
6. Tilting tournament.
7. Novice sailing, cruising rig, 1 1/2-mile triangle.
8. Unlimited sailing, open to any canoe, 3-mile triangle.
9. Atlantic Division, Elliott sailing trophy, 16 ft. by 30 in. class and handicap, 3-mile triangle.
10. Hurry-scurry.

A. C. A. rules will govern all events. Further particulars will be published in FOREST AND STREAM next week.

J. K. HAND,  
Chairman Regatta Committee.

## Rifle Range and Gallery.

### Fixtures.

June 12-20.—National Schuetzenbund Festival, Union Hill, Schuetzen Park, N. J.

### Union Hill Park Annual Team Contest.

For several years past the Union Hill Schuetzen Park has been opened in the early spring, May, with a team shoot, made up from the societies who hold their festivals in this park.

During the past six months the park management has passed into the hands of John Moje, who, succeeding Emil Lattmann, made extra efforts to have his opening greater and more successful than those of his predecessors. Mr. Moje had ten silver cups made for the occasion, also ten gold medals. The latter to be presented to the individual in each team making the highest score.

Mr. Moje also had a fine gold medal made for the man who made the three best center shots on the bullseye target in the individual contest.

The programme called for teams of fifteen men, ten shots per man, on the 25-ring target.

In addition to the team shooting, prizes were put up on the point target, open to all comers. There were premiums for the most points and prizes for the best center shot, 3 in. carton.

Ten societies in and about New York city entered teams. They were as follows: New York Central Corps, New York Corps, New York City Corps, Harlem Independent Corps, New York city; Swiss Shooting Society, Hoboken Independent Corps, Hoboken City Corps, Hoboken Corps, Hoboken, N. J.; Union Hill Corps, Union Hill, N. J.; German-American Bund, Hudson county, N. J.

The contest was held on Wednesday, May 4. Fortunately for the success of the affair, the weather was warm and clear.

In addition to the men entered in the team contest, there was a large group of New York and New Jersey riflemen present to enter the contest for prizes on the point target. H. M. Pope was among the visitors, and an active competitor for prize honors.

Of our local experts, there were Michael Dorrier, Gus Zimmermann, L. P. Hansen, C. G. and B. Zettler, H. D. Muller (Bullseye), Geo. Schlicht, J. H. Taylor, Emil Berckmann, D. Scharninghaus, R. Busse, and John Facklamm. In all, there were probably one hundred and seventy-five riflemen in the shooting house during the day who shot on the programme.

In the team contest the team of the New York Central Corps again carried away the honors, and got the first cup. The New York City Corps team was second.

The highest individual score in the team contest was made by Gus Zimmermann, of the New York Central team, 222.

In the individual contest on the point target, H. M. Pope led the group. He was first for the most points, first for the best center shot, and first for the three best bullseyes. It was, in fact, Pope's day, for the man and his gun were in close touch.

The results of the day were highly satisfactory to John Moje, for the attendance was large and there were no unpleasant incidents.

Ten-shot scores, 25-ring target, possible 250, distance 200 yds.: New York Central Corps Team—Gus Zimmermann 222, H. Koster 202, H. Bockmann 199, D. Scharninghaus 194, F. Kost 193, F. Rabbes 187, Val. Horn 185, H. D. Muller 184, J. von der Lieth 183, F. Schroeder 173, Wm. Koch 172, W. J. Daniel 171, Geo. A. Viemeister 169, M. Teschmacher 151, J. Jordan 121; total 2709.

New York City Corps Team—R. Busse 217, Aug. Kronsberg 204, Wm. Grapentin 203, John Wagner 199, John Martz 192, Chas. G. Zettler 185, R. Schwanemann 177, J. Facklamm 175, Ch. Schmidt 169, R. Bendler 167, C. D. Rehm 166, J. Keller 157, Ch. Wagner 153, H. C. Radloff 151, F. Daub 133; total 2648.

Swiss Shooting Society Team—Geo. Schlicht 207, Aug. Dietrich 190, M. Simmen 199, J. Troxler 186, J. Simmer 182, J. J. Gobber 181, Ch. Suhner 173, H. Manthe 172, F. Kaage 163, J. Seefi 171, J. Dietrich 158, A. Steiner 157, G. Bietmann 152, J. Reisch 142, Geo. Lorenz 124; total 2569.

New York Schuetzen Corps 2485.  
Hoboken Independent Corps 2300.  
German-American Bund, Hudson county, N. J., 2222.  
Harlem Independent Corps, New York city, 2134.  
Hoboken Schuetzen Corps 1831.  
Hoboken City Corps 1786.  
Union Hill Corps 1721.

Point target, premiums for the most points: H. M. Pope 312, Gus Zimmermann 241, H. D. Muller 227, R. Busse 214, D. Scharninghaus 207, M. Dorrier 197, Geo. Schlicht 149, L. P. Hansen 133, J. H. Taylor 83, E. Berckmann 55, H. Bahn 54, J. Facklamm 54.

Bullseye, 3 in. carton, the best center shot to count by measurement: H. M. Pope 10 1/2 degrees, J. H. Taylor 14, M. Dorrier 18, Gus Zimmermann 21 1/2, L. P. Hansen 23, H. Bahn 25 1/2, H. D. Muller 29, Owen Smith 41, R. Busse 41 1/2, D. Scharninghaus 44, E. Fischer 45 1/2, R. Bendler 48, Chas. G. Zettler 55, H. Koster 56, B. Zettler 58.

Premiums for most red flags: H. M. Pope 45, Gus Zimmermann 26, R. Busse 20.

Special medal for the three best bullseyes: H. M. Pope, Springfield, Mass.

First flag: H. M. Pope; last flag, Geo. Schlicht.

### The New York Independent Corps.

THERE was a good attendance of the members of the Independent Corps at Union Hill Park on Friday, May 6. John Facklamm made the good score of 58 points out of a possible 60 on the man target. Aug. Begerow was high on the ring target. Capt. Zimmermann was high on the point target.

Ring target, 5-shot scores, two count, possible 125: A. Begerow 106, 114; G. Zimmermann, 106, 109; L. Schmidt 106, 108; G. Nienaber 109, 104; J. Facklamm 98, 103; E. Gremer 95, 106; H. Koster 97, 103; L. C. Hauenstein 93, 88; H. Koch 88, 93; G. T. Zimmermann 79, 98; Wm. Soll 80, 91; F. Liegbel 94, 60; H. Weber 68, 81; H. Kaberske 70, 74; M. Dusenbery 54, 43; H. Zimmer 32, 39; F. A. Young 43, 23.

Man target, 3-shot scores, possible 60; J. Facklamm 58, L. C. Hauenstein 57, G. Zimmermann 56, L. Schmidt 53, A. Begerow 53, Wm. Soll 51, G. T. Zimmermann 50, E. Greiner 50, H. Koster 47, H. Koch 47.

Point target, most points: Gus Zimmermann.

Best point ticket, possible 20: Gus Zimmermann 19.

Most red flags: Gus Zimmermann. First flag, Gus Zimmermann. Last flag, F. Liegbel.

### Zettler Rifle Club.

THE Zettler Club held its first practice shoot for the present season at Union Hill Park, on May 7. The attendance was small, but several high scores were made:

Geo. Schlicht had a new barrel in his Ballard action, and shot it for the first time. His shooting was excellent. W. A. Tewes, L. P. Hansen, E. H. Van Zandt, Emil Berckmann and Harry Fenwirth shot in good form. The club will shoot again on May 14.

Ten-shot scores, possible 250: Geo. Schlicht 231, 221, 230; W. A. Tewes 227, 224, 219; L. P. Hansen 223, 222, 214; E. H. Van Zandt 224, 219, 210; E. Berckmann 216, 209, 212; H. Fenwirth 209, 209, 203; Mrs. H. Fenwirth 168.

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

### Fixtures.

May 11-12.—Springfield, O., Gun Club's target tournament. Geo. Morgan, Sec'y.

May 11-13.—Spirit Lake, Ia.—Iowa State Sportsmen's Association tournament. J. Burmister, Sec'y.

May 12-13.—Wilmington, Del.—Wawaset Gun Club annual spring tournament. W. W. Foord, Sec'y.

May 16-18.—Southern Trapshooters' Association's thirteenth tournament at targets, under auspices of Vicksburg, Miss., Gun Club; \$500 added. J. J. Bradfield, Sec'y.

May 16-21.—York, Pa.—Tournament of Pennsylvania State Sportsmen's Association, under auspices of York City Gun Club. N. M. McSherry, Sec'y.

May 17-18.—Dubuque, Ia., Gun Club's fifth annual amateur target tournament. A. F. Heeb, Cor. Sec'y.

May 17-19.—Davenport, Ia.—Cumberland Gun Club's annual amateur tournament. W. F. Kroy, Sec'y.

May 18.—Wellington, Mass.—Fifth annual team shoot and target tournament of the Boston Gun Club.

May 18.—Boston, Mass. Gun Club annual team target shoot. H. Kirkwood, Sec'y, 23 Elm street, Boston.

## DRIVERS AND TWISTERS.

*Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.*

Messrs. G. W. Hagedorn and Gus E. Grieff were visitors at the shoot of the Cleveland, O., Gun Club, on Saturday of last week.

At Media, Pa., on May 7, the 15-man team contest, between teams of the Media Gun Club and the North Camden Gun Club, was won by the latter, the score being 294 to 273. Each man shot at 25 targets.

Messrs. Sanford, Geikler, Harrison and Jenkins, May 7, tied on ten live birds, second chance in the Jenkins 10-bird, two-chance handicap, ties shot off mis and out. The result of the shoot-off was: Jenkins, 3; Sanford, 2; Geikler and Harrison, 1.

Mr. Harry Thurman, of trapshooting and shooting jacket fame, Germantown, Pa., was a visitor in New York on Monday of this week. The passing years seem to add more and more to his big-hearted good fellowship.

Mr. William Clayton, of Kansas City, has challenged Mr. J. Wilmot, of Lexington, Mo., to contest for the Wyeth live-bird trophy, 100 live birds per man, May 19. Mr. Wilmot won this trophy at the recent Schmelzer tournament.

Mr. H. M. Brigham, considered the best shot of the Crescent Athletic Club, of Brooklyn, was high man at the third contest for the automobile, Newark, N. J., May 7. He made the excellent score of 93 out of 100. There was no professional present to contest for the professional cup.

The Bergen Beach, L. I., Gun Club holds shoots on every Saturday, and on the second Tuesday of every month. To reach the grounds, take Flatbush avenue care to Bergen Beach, for Nostrand avenue cars, transferring to Flatbush avenue cars. The grounds are at Avenue N and E, 71st Street. Mr. H. W. Dryer is secretary-treasurer.

Harvard won the intercollegiate shoot at New Haven, Conn., on May 7. The scores were as follows: Harvard—Marsallis 47, Bancroft 39, Marshall 36, Foster 45, Rennick 42; total 209. Princeton—Stutesman 43, Archer 35, Gaines 33, Munn 45, Pell 43; total 199. Yale—Hale 27, Thompson 43, Borden 38, Sturges 38, Kineon 40; total 186. Pennsylvania—Adams 27, Williams 40, May 41, Longnecken 38, Koons 33; total 189.

The programme of the Auburn, N. Y., tournament, May 18 and 19, provides twelve events each day, 10, 15 and 20 targets, 75 cents, \$1, \$1.25 and \$1.50 entrance. No. 6, at 20 targets, is a merchandise event each day. The first prizes are a Smith hammerless and an Ithaca hammerless. Targets, 1½ cent. The total programme each day is: 190 targets, \$15 entrance; \$10 added. Shooting commences at 9:30. Messrs. Knox & Knapp are the managers.

Mr. Ed. G. White, of the DuPont Powder Co., tarried a few hours in New York in the early part of last week. He was en route from Wilmington to Canada, where in the Ontario district he will act as a trade representative of the DuPont Co. Mr. White possesses the happy ability to make friends readily, is an expert in the use of a shotgun, has a long experience in the practical workings of the powder trade, and therefore his distinguished success is a certainty.

The programme of the Aquidneck Gun Club's third annual tournament, Newport, R. I., Memorial Day, May 30, provides nine events, six at 15, and three at 20 targets, \$1 and \$1.25 entrance. Shooting commences at 9 o'clock. The club will divide \$25 in gold among the four high amateurs shooting through the programme, as follows: To first, \$10; second, \$7.50; third, \$5; fourth, \$2.50. Moneys divided Rose system, 4, 3, 2, 1. Targets 1½ cent. Manufacturers' agents for targets only. Lunch and loaded shells obtainable on grounds. Send guns and shells to J. S. Coggeshall, 32 Church street.

The Minneapolis, Minn., Gun Club has provided a programme of special interest for their tournament, May 19-21, the club's third anniversary. Each day there are twelve events at 15 targets, \$1.50 entrance, and one at 20 targets, \$2 entrance. Competition begins at 9 o'clock. Targets, 2 cents. Purses divided, 30, 25, 20, 15 and 10 per cent. Handicaps 16 to 22yds. Total sum added to purses and given as averages, \$1,000. Forty-four general averages of \$5 each. Competition open to all, but professionals who do not care to compete under a handicap may shoot from the 16yd. mark for targets only. Ship shells and guns to Fred E. McKay, 244 First avenue South, and they will be delivered free on the grounds. Dinner will be served on the grounds. May 18 will be practice day.

The Oklahoma Gun Club have issued the programme of the fifth annual tournament of the Territorial Sportsmen's Association, to be held under their auspices at Oklahoma City, May 19 and 20. Shooting commences at 9 o'clock. Handicaps, 15 to 19 yards. Amateur competition. Event 9, first day, is a merchandise shoot; first prize, Marlin shotgun. Events 6 and 7, second day, are the champion contest, 50 targets. May 18 will be practice day. Annual business meeting will be held on May 19. On the first day the programme provides twelve events, 15 and 20 targets, entrance \$1.50 and \$2, added \$10 and \$15. On the second day, eleven events, 15, 20 and 25 targets, entrance \$1.50 and \$2, added money \$10 and \$15. Low railroad rates will probably be made from all points within 100 miles. Mr. J. C. Clark is the secretary.

At the tournament of the Interstate Association, Nashville, Tenn., May 4 and 5, the high averages for the two days were as follows: First, Mr. C. G. Spencer, 332 out of 350; second, Mr. J. F. Fletcher 329; third, Mr. H. B. Money, 328. Mr. Fletcher won the silver loving cup, presented by the Gray-Dudley Hardware Co., to the amateur making high general average. On the first day, the manufacturers' agents scored as follows: Mr. H. N. Kirby was high with 165 out of 175; Mr. C. G. Spencer was second, with 164; Mr. H. B. Money was third, with 163. Amateurs: First, Mr. J. F. Fletcher, 162; second, Mr. W. G. Harris; third, Mr. Frank Legler. On the second day the high averages of the manufacturers' agents were as follows: First, Mr. C. G. Spencer, 168 out of 175; second, Mr. H. B. Money, 168; third, Mr. F. C. Riehl. Amateurs: First, J. F. Fletcher, 167; second, W. A. Baker, 162; third, "Foxy Quiller," 159.

Mr. C. G. Grubb, secretary W. P. T. S. L., writes us as follows: "The Irwin Rod and Gun Club, Irwin, Pa., have changed the dates of their tournament from May 10-11 to Sept. 6-7. The next tournament under the auspices of the Western Pennsylvania Trapshooters' League will be held at Brownsville, Pa., May 25-26. The Brownsville Boys are a bunch of good fellows, and will show all of the shooters a royal time. Mr. Edw. Painter, who shoots under the name of Kelsey, has very kindly placed at the disposal of the League his fast traveling yacht, which will leave the foot of Wood street, May 24, at 2 P. M. All shooters desiring to take this magnificent trip will kindly send their names to the secretary of the League, to be registered. Kelsey's pleasing manner, together with his reputation in the past for supplying prompt reinforcements for the culinary department, and his willing disposition to serve, have made him a general favorite among the trapshooters."

Mr. John M. Lilly, president of the National Gun Club, writes us as follows: "On Monday, June 27, there will be practice shooting all day; Tuesday, ten 20-target races, \$10 added to each; Wednesday and Thursday, the same. The tenth race on Tuesday, and the ninth and tenth on both Wednesday and Thursday will go to form a 100-bird race which will decide the target championship of the National Gun Club for the year 1904. As an evidence of the championship there will be presented to the winner a sterling silver cup properly inscribed. On Friday there will be five 20-bird races with \$10 added to each. These thirty-five races will be strictly amateur, and contestants will be handicapped according to their skill. On Friday afternoon there will be a 100-bird target handicap, with \$50 added, which will be open to all. The contestants in this race will also be handicapped according to their skill. In addition there will be \$50 set aside for the high averages for the five guns. These high averages will be divided high guns. The division of money in the 20-bird races will be by the Rose system—points 7, 5, 4, 3. The division of money in the handicap will be high guns, with two places made for each ten entries. BERNARD WATERS.

### Garfield Gun Club.

CHICAGO, May 7.—The appended scores were made on our grounds to-day on the occasion of the second shoot of the first series. J. D. Pollard captured the jewelry in Class A on 22, while L. Thomas did the trick for Class B on 23. Hathaway was made happy in Class C with a score of 20.

In the cup shoot, which immediately followed, Pollard was again winner in Class A, Thomas in Class C and Hathaway in Class B.

The day was only a fairly good one for target shooting, there being a rather stiff head wind, which caused the targets to soar and dip badly at times. Attendance was good, twenty-six shooters showing up.

Cup, 15 singles and 5 pairs: Pollard 23, Dr. Meek 19, Wilson 6, McGowan 18, Thomas 19, Cummings 17, Birkland, Jr., 19, Eaton 15, Birkland, Sr., 11, Gould 19, Cook 9, Hathaway 20, Kissack 14, Long 11, Porter 12, McDonald 16, Ford 16, Stone 16, McKinnon 18, Bullard 16, Vernon 13, Dr. Stillman 14, Dr. Huff 18, Ostendorf 16, Seymour 15.

Second trophy contest, 25 targets: Pollard 22, Dr. Meek 20, Wilson 17, McGowan 19, Thomas 23, Cummings 17, Birkland, Jr., 18, Eaton 21, Birkland, Sr., 19, Gould 11, Cook 19, Hathaway 20, Kissack 18, Long 14, Porter 15, McDonald 18, Ford 8, Stone 18, McKinnon 18, Bullard 13, Vernon 9, Dr. Spillman 11.

### Cleveland Gun Club.

CLEVELAND, O., May 7.—The semi-monthly shoot of the Cleveland Gun Club was well attended. Messrs. Gus E. Grieff and Geo. Hagedorn were visitors. The different prizes for the classes were subjects of keen competition. In Class A, first was won by Williams, second by Eadie. Doolittle and Hall were respectively first and second in Class B. In Class C, Battles was first; with Sanford and Franklin tied for second. Class D, the winners were Burns and Sheldon, first and second. The event was at 40 targets. Scores:

Class A: Williams, 40; Eadie, 34; Grieff, 35.  
Class B: Jack, 35; Doolittle, 38; Sanford, 34; L. Hull, 37; North, 29; Cannon, 13; Franklin, 34.  
Class C: Martin, 33; Mack, 30; Hopkins, 29; Battles, 34; Hull, 25.  
Class D: Judd, 31; Sheldon, 30; McKean, 23; Hastings, 24; Burns, 32; Esty, 18; Wallace, 27; Hagedorn, 20; Trojan, 16; Stanley, 21.

### Enterprise Gun Club.

McKEESPORT, Pa.—The shoot of the Enterprise Gun Club on April 30 was the first of the series for the Daily News medal, the competition for which was limited to the territory bounded by Glenwood, Moneset, Scott Haven, Pitcairn and Gill Hall. The conditions were 50 targets, \$1 entrance, no handicap. The scores: Calhoun 46, Cochran 45, Hunter 36, H. Hale 29, W. Hale 32, Everett 42, J. Hale 48, Mack 39, Clark 36, Ross 37, Knight 41, Mains 35, Frank 13.

The final shoot for this medal is fixed to take place on May 14, and on this date there also will be a contest for the Hunter Arms Co. medal.

Event, 25 targets: F. L. Barnes (4) 21, Dr. J. G. Knowlton (1) 21, W. J. Elias (4) 25, G. Bechtel (5) 23, H. C. Palmer (12) 20.

## Interstate Tournament at Nashville.

NASHVILLE, Tenn., May 7.—The Interstate Association's tournament given at Nashville, Tenn., May 4 and 5, under the auspices of the Cumberland Park Driving Club, was a profound success. The attendance, especially from out of the city, was larger than was to be expected, contestants being present from all parts of the country.

An ideal day and a big crowd marked the opening day. A large party of sportsmen boarded the Spruce and Glendale car at the Duncan Hotel and the Maxwell House, and all along the line parties and individuals were picked up until the car was comfortably filled. There were enough local and foreign sportsmen aboard this car alone to guarantee the tournament would be a success, and when the party reached the grounds a number of early risers were found to be already on hand with ammunition and guns ready to begin the day's sport and impatient for the first call of "pull."

The shooting was fair from the start, and the morning's programme was put through with such celerity that six events were completed by noon, and when lunch was announced everyone was in good humor, the high and low score men joking as they gathered around the lunch stand. The afternoon's programme was also finished in good time, many of the contestants desiring to attend the base ball game which marked the opening of the season in Nashville.

Among the manufacturers' agents, Mr. H. N. Kirby was in first place with a score of 165 out of 175 shot at. Mr. C. G. Spencer was second with 164, and Mr. H. B. Money, third, with 163.

Among the amateurs Mr. J. F. Fletcher was first with 162; Mr. W. G. Harris was second, with 155, and Mr. Frank Legler third, with 154.

The second day developed quite as good interest, and almost as large a number of entries as upon the first day. The first squad went to the traps a little earlier than on the opening day, and the programme was again finished in ample time to attend the ball game, which seemed to be quite an attraction for a number of the contestants.

Mr. C. G. Spencer led the manufacturers' agents the second day with a score of 168 out of 175 shot at. Mr. H. B. Money was in second place with 165, and Mr. F. C. Riehl third, with 162.

Mr. J. F. Fletcher was again high amateur with 167 out of the 175. Mr. W. A. Baker was in second place with 162, and Foxy Quiller third, with 159.

First general average was won by Mr. C. G. Spencer with a score of 332 out of 350. Mr. J. F. Fletcher was second with 329, and Mr. H. B. Money third, with 328.

Mr. Fletcher also won the silver loving cup presented by the Gray-Dudley Hardware Company to the amateur making the highest average shooting through the entire programme both days.

The trade was represented by Messrs. Money, Trimble, Skelly, White, Cassidy, Anthony, Waters, Riehl, Spencer, Cuddy and Kirby. Mr. Irby Bennett, general agent of the Winchester Repeating Arms Company, and President of the Interstate Association, was also present both days.

Two sets of traps were used, and the sportsmen were all loud in their praise of the lay of the grounds, the arrangements of the shooting lodge and the general conducting of the tournament. The scores of both days follow:

## Ohio Trap.

### Cincinnati Gun Club.

THE series of ten shoots for the amateur championship of the club at flying targets was started on May 1, seven members entering. The match is at 100 targets per man, ten shoots, one each week throughout May and June. No match will be postponed except on account of bad weather, in which case two matches will be shot on the next date, and no one can shoot his score in this match in connection with any other club event. The first match was shot on May 1, and Barker led with 95, his nearest competitor being Faran, with 92. The weather was not the best for high scores, and these two certainly did good work to break over 90 per cent. The scores follow:

First match in club amateur championship series, 100 targets per man: Barker 95, Le Compte 94, Faran 92, Gambell 86, Harig 84, Williams 80, Ahlers 80, Maynard 78. Le Compte did not compete.

The following scores were made in the April 30 Parker prize gun series, the first of the following week, by those unable to be present on the regular club day: Gambell (10) 100, Dick (22) 100, Maynard (18) 92, Ryebolt (30) 100, Bleh (35) 100, Sampson (30) 98, H. Sunderbruch (40) 100, Cunningham (50) 100.

May 7 was oppressively warm, but a fair number of shooters were at the grounds, and twenty-two took part in the cash prize shoot. Considerable shooting has been done during the week and a number of interesting matches shot, especially one on May 2 between Gambell and the first secretary of the club, J. A. Penn. In a 100-target race on the 5th Williams broke 92, a score that only a very few of the shooters here make. Gambell's 91 in this match shows he is getting the hang of his new gun. The scores:

Cash prize shoot, 50 targets: Harig (18) 45, Faran (19) 43, Gambell (16) 43, Maynard (18) 41, Ahlers (21) 40, Medico (18) 40, Peters (17) 40, Jay Bee (17) 39, Williams (16) 39, Herman (17) 38, Don Minto (16) 38, Block (18) 36, Eaton (17) 36, Falk (16) 36, Ackley (17) 32, Captain (16) 27, Weller (16) 26, Bullerdick (18) 25, Roll (19) 44, Pohlar (17) 43, Pfeiffer (17) 32, Pete (16) 27.

Match at 50 targets:

Gambell 42, Harig 42; total 84.

Medico 40, Faran 44; total 84.

Shoot-off, 25 targets:

Gambell 21, Harig 20; total 41.

Med

## WESTERN TRAP.

## Texas State Tournament.

HOUSTON, Tex., May 4.—The greatest of interest was centered in the live-bird contest, which was the opening event of the Texas State tournament, started here yesterday. There were so many entries that the shoot was not finished in one day. The birds were fine, and the day in their favor, many of the good shots fell away badly. All the professionals and some of the best amateurs barely reached third and fourth money.

E. J. Nalle, of Austin was the only Texas man able to land the 20 straight, and he is now Texas' live-bird champion. He shot steady, and was in luck, as was Boisseau, of Shreveport, La., who shot, as did others, for the sweep.

F. K. Sterrett, of Abilene, was the lucky good shoot who alone scored 19 and took away the first money prize.

Mrs. Sterrett showed what a woman can do when put to the test. Together with her husband, they drove thirty-five miles across country, caught train for Houston and began to shoot as soon as they arrived on the ground. Bryan Heard was not shooting up to form of other years, and lost 4.

The visitors were given a trolley ride in the evening, which all enjoyed. The scores:

## First Day.

Shoot for \$400 State live-bird medal:

## Second Day.

It rained out at Highland Park, where the shoot was being continued, as there are more target shooters than live-bird shots even in this great game country. There were fifty-eight shooters out for the various events.

The rain had interfered on Tuesday, and the shooting was fast and furious to-day, as the pieces of the targets rained into the flood that swept down the river in front of the score. This was a handicap shoot, none but the traveling men being put at 19yds. and but two of the State men at 18yds., while there were twelve at the 15yd. and three at the 14yd. mark.

The individual medal was up to-day, and for the second time was won by Faurote. His fine score of 49 was tied by Dr. Hann, but on the shoot-off the Doctor got nervous and missed 9 targets, while the old experienced shot made 24.

In the evening the entire party, with a brass band to lead it, was taken over the city, and a general good time was had, as with singing, shouting and speaking, the citizens could easily discern that a crowd of "crazy" shooters was aboard.

When the crowd had spent some three hours on a tour of the city, then came the attentions that Bryan Heard and others desired should be paid to the inner man, and an elegant luncheon was spread, to which all did justice.

Some of the shooters are disposed to bar the traveling men from shooting in the State events for medals, etc. The scores:

Events:	1	2	3	4	5	6	7	8	9	10
Faurote, 19	17	17	19	14	15	19	16	18	15	16

Sherrill, 16	15	17	15	19	18	14	13	18	18	18
Stevens, 16	16	17	15	17	17	14	19	15	17	18
Brady, 14	15	18	16	19	16	19	17	15	16	16
Ford, 16	15	16	19	14	19	15	15	15	15	15
Lockett, 16	15	18	19	15	16	16	13	16	16	16
Mrs Sterritt, 16	11	15	15	15	15	15	15	15	15	15

The medal shoot for the individual championship of the State at inanimate targets, 50 targets, resulted as follows: Faurote 49, Dr. Hann 49, Hubby 46, Miller 39, Wade 48, Wilcox 44, Sleigel 42, Atchison 43, Kaufman 44, Jones 45, Ingraham 41, Heard 40, Dick Johnson 44, J. A. Jackson 45, Sens 41, Bosley 43, Boisseau 42, Moeser 46, Chaudet 37, Marston 35, Connelly 41, Nalle 40, E. Forsgard 46, Moore 44, Pickett 42, Turner 39, Sterritt 44, Cleveland 39, Stevens 37, Tucker 44, Speight 40, Gardner 34, Currant 38, Dunkerly 43, Thomas 21.

The shoot-off of the tie for first place between Faurote and Dr. Hann resulted: Faurote 24, Dr. Hann 16, out of a maximum of 25. In the medal contest all shot from the 16yd. mark.

## Stray Pick Ups.

Bryan Heard and Otto Sens were the committee for the Highland Gun Club, who bossed the entertainment, and they did their part to perfection.

L. I. Wade came only one behind the champion in the 50-target race.

F. K. Sterrett, the Abilene shooter, made a fine run of 57 straight. He will hold his own in any company.

Louis Moeser was given an additional handicap on second day, and his scores fell away.

Hard to beat Faurote out of that medal, as this is the third time he has won it.

C. F. Gilstrap, of Taylor, made the fine score of 59 out of 60.

Maurice Kaufman can shoot of course, when he is not managing a shoot. He is a good fellow, and all-round sport.

E. L. Hann, of Denton, was the hero of the shoot, when he made that 25 straight; too bad he had so many slips in the shoot-off.

Col. Guessaz's chorus set up a melody in honor of the occasion.

Hilbreth and Guessaz found out that they were not the only shooters who could sing.

The whole shoot stopped to watch their favorites in the 50 championship race, and there were many ladies present who were quite delighted.

## Jewell Fourth Annual.

Jewell, Ia., May 6.—The tournament held here yesterday was not well attended, but some fine scores were made by those present.

Chas. Cole and Dr. C. M. Proctor tied with 180, W. S. Hoon 178, L. A. Johnson 171, Peterson 169, J. E. Mayland 162.

Shoot for Hamilton-Story county medal, W. S. Hoon, holder, John Peterson, challenger; score: Hoon 40, Peterson 35.

Dr. Proctor thought Hoon easy, and a second tilt was the result. This time Hoon came on with a straight 50 to Proctor's 44.

Events:	1	2	3	4	5	6	7	8	9	10	11	12

## Utica Gun Club.

Utica, O., May 5.—The spring shooting fever has attacked the home club members, and when out this afternoon several were not satisfied until 100 shots had been fired. Following are the scores: John Taylor shot at 215, broke 187; Lee Bottenfield 215, 186; F. A. Hankinson 210, 174; Fred Hall 210, 172; Hick Hall 205, 145; Dave Parry 190, 143; Henry Hankinson 170, 100; Will Perhan 140, 105; J. Jackson 130, 98; E. Stowe 125, 100; Sam Burrows 65, 46; Fred Burrows 65, 30; Earl Murphy 55, 38; E. Webster 50, 28; G. Hankinson 40, 21.

## Twin City Gun Club.

Peoria, Ill., May 3.—A few weeks ago the Twin City Gun Club lost their club house by fire. Then the high water and the most excellent duck shooting prevented the members getting together until last Sunday.

There were over 1,000 targets shot at, and is the largest shoot held by this club in a year. The next shoot will be held May 15 at 2 P. M. Visitors welcome. Shooting at 50 targets, the scores were: Connor 45, Baker 46, Martin 38, Reed 39, Connor 35, Herman 37.

## Hampton Gun Club.

Hampton, Neb., May 24.—The monthly shoot of the club was held to-day. The members, it seemed, had business elsewhere, there being but two to contest for the Schmelzer trophy, viz.: H. O. Harvey, 20yds., 23; N. B. Carver, 16yds., 23.

Shoot-off: Harvey, 4, 5, 5. Carver, 4, 5, 4.

## Morrisonville Gun Club.

Morrisonville, Ill.—The boys are getting going in an animated fashion. Not content with shooting ordinary 25-target events, two of the nimrods, Stout and Reasoner, on May 5, met and shot a 100-target race. This being the home of Dave Morrison, there should be some comers. The scores, 25 targets each: Stout 24, Wyckoff 23, Manning 22, Reasoner 23, Clower 15.

The 100 target race: Stout 95, Reasoner 92.

## Official Challenge.

F. B. Cunningham, St. Joseph, Mo., secretary of the Midwinter Shooting Association, has been duly notified that William Clayton, of Kansas City, has challenged the winner, J. Wilmot, of Lexington, Mo., for the Wyeth live-bird trophy. Same will be shot May 19, with 100 live birds to the man. Mr. Wilmot won this trophy at the late midwinter tournament held by the Schmelzer Arms Co.

## Kansas Team Challenged.

Frank B. Cunningham, captain of the All-Missouri team, has challenged the Kansas team through Ed. O'Brien, of Florence, Kans., to shoot a match for the Elliott live-bird trophy, won at the late tournament held at Elliott's park.

This match will prove interesting, as the All-Missouri only lost by one bird at the contest. Mr. Cunningham does not mention if he will shoot all Missouri team, but the supposition is that he will. He will probably not have the assistance of A. D. Mermod.

## Wabash Tournament.

### Interstate Association's G. A. H. Programme.

THE fifth Grand American Handicap target tournament will be held on the grounds of the Indianapolis Gun Club, Indianapolis, Ind., June 21 to 24, inclusive.

In presenting this programme we would respectfully call the attention of all lovers of the sport of trapshooting to the growing popularity of the Grand American Handicap at targets. From its inception, four years since, it has rapidly grown in favor, until to-day it is justly recognized as the leading inanimate target event in America.

This year's tournament will be conducted on the same equitable lines as has characterized our previous tournaments. Each contestant will be the recipient of every attention and just consideration, consistent with the fairness that has always been a feature of the Interstate Association events.

The programme of this tournament is not materially different from that of its predecessor, held last year. That programme was so happily devised that it won the approval and support of the trapshooting fraternity to an unexpected degree. If the details of the programme are scanned, it will be found that the interests of the amateur have been carefully considered. A majority of the events are open to amateurs only, while in the events which are open to all, a handicap obtains, of scope sufficient to allow the establishing of a true equity between the amateur and the manufacturers' agent.

Much has been written about the shooting grounds of the Indianapolis Gun Club in the columns of the sportsmen's journals. It is, therefore, scarcely necessary to say much on that point. The mammoth club house, with its five sets of traps arranged in a straight line, occupies an inclosure of sixteen acres under grass, the whole of the sixteen acres being as level as the conventional billiard table. All five sets of traps are in front of the club house, and easily accessible from the piazza.

With such marked advantage, therefore, in favor of the Indianapolis Gun Club, it is a hard matter to calculate with any degree of accuracy or positiveness as to the probable entry list for the Grand American Handicap of 1904. The programme has accordingly been undertaken with extra care, and is presented in detail later with full assurance that experience will show that the confidence of the trapshooting public has not been misplaced.

If you take part in the tournament you must abide by the rules and conditions as announced in this programme. Ignorance of the rules is no excuse for any error or oversight relating to the competition. All contestants are expected to be on the grounds by 9 A. M. each day. Failing therein, each contestant is responsible for his acts of negligence.

All entries for the Grand American Handicap at targets must be made on application blanks, which can be secured by addressing Mr. Elmer E. Shaner, secretary-manager, 219 Coltart Square, Pittsburg, Pa.

A brief inspection of the names of several gentlemen who have kindly consented to act on the Handicap Committee will show that the Interstate Association has been just as careful as ever in selecting its material. To award handicaps is at best but a thankless task, and the Association can never express adequately its gratitude to the seven gentlemen composing the Handicap Committee for their courtesy and self-denial in accepting office on such committee.

Each member of the committee has personal knowledge of the scores and records of the vast majority of the trapshooters of this country, and the Interstate Association feels perfect confidence in the ability of the committee as a whole and in each member of the committee as an integral part of that whole.

The committee is constituted as follows: Messrs. Ed. Voris, Crawfordsville, Ind., Chairman; J. Q. Ward, Paris, Ky.; C. M. Powers, Decatur, Ill.; J. L. D. Morrison, St. Paul, Minn.; Alex. S. Tolsma, Detroit, Mich.; W. D. Townsend, Omaha, Neb.; John A. Flick, Ravenna, O.

With the utmost confidence it is predicted that this committee will not fall below the estimate that has been placed upon it.

Mr. Elmer E. Shaner, secretary-manager of the Interstate Association, will be secretary to the committee, but will not have a vote in the handicapping of contestants.

The committee will meet at the Denison Hotel, Indianapolis, Ind., at 9:30 A. M., Saturday, June 18, but handicaps will not be announced until the next day.

The system of handicapping which is, perhaps, the most generally used is that of giving extra allowance of targets to the weaker shots. This is, at best, very unsatisfactory, it being difficult to adjust handicaps on an equitable basis under such a system.

Another system of handicapping is that by which an allowance of "misses as breaks" is made to those who are less expert than their opponents. This system is easier to handle in a fairly

equitable manner than the one above described, but it is still somewhat unsatisfactory.

The Interstate Association decided four years ago to discard them both, and handicap by distance only. Success proved its wisdom. The distance handicap will be used again this year.

Shooting will commence at 9 A. M. sharp each day. The grounds will be open for practice and sweepstake shooting on the afternoon of Monday, June 20. The Interstate Association trapshooting rules will govern all points not otherwise provided for. Note that Section 1, Rule 11, of the target rules relating to bore of gun, is not in force at this tournament. Note that Section 5, Rule 21, of the target rules (Sergeant system) now reads: "The targets shall be from unknown traps. Five sets of traps, arranged according to the Sergeant system, will be used. No guns larger than 12-gauge allowed. Weight of guns unlimited. Black powder barred. Targets will be thrown about 50yds. Price of targets, 2 cents each, included in all entrances. The Interstate Association reserves the right to refuse any entry. The standard bore of the gun is No. 12, and in the handicap events all contestants will be handicapped on that basis. Contestants using guns of smaller bore must stand on the mark allotted to them. The Interstate Association reserves the right to select two cartridges from each contestant (to test the same for proper loading), the selection to be made at any time, when a contestant is at the firing point. In case entries are so numerous that darkness or other cause prevents the finish of events the same day they are commenced, the management reserves the authority to stop the shooting at any time it may deem it necessary. In this case, weather permitting, the shooting will begin, where left off, at 9 A. M. sharp the next day. "Shooting names" will not be used at this tournament. Shooting "for targets only" is open to manufacturers' agents solely; all other contestants must make entry for the purses. There will be no practice shooting allowed, nor preliminary events shot, prior to the commencing the regular events scheduled for the day.

Entries for the second day's events (the Preliminary Handicap included) and entries for the fourth day's events (the Consolation Handicap included) close at 5 P. M., the day before they are scheduled to be shot. All entries for these events must be made by that time, as penalty entries will not be taken for them.

In case entries are so numerous that events cannot be finished until late any day—thus keeping the compiler of scores back with his work—a branch of both the cashier's and compiler of scores' offices will be opened that night in the Denison Hotel, where winners of money can secure the amounts due them, or they can obtain same at the shooting grounds the next day.

A contestant who takes part in the tournament any day must make entry for all events called for by the programme of that day. Entries will not be taken for less than the total number of events (the handicap events included) scheduled for the day. In case a contestant, after making entry, fails to take part in any event, or events, his entrance will be forfeited for that particular event or events, and the amount so forfeited will be added to the purse the same as if he had contested.

This rule is made necessary by the outlook for an exceptionally large entry list, and it will be impossible to keep this large tournament working smoothly unless the squads are kept intact.

The purses in all events, except the three handicaps, will be divided according to the Rose system, into four moneys at the ratio of 8, 5, 3, 2.

The Interstate Association adds \$1000, of which amount \$100 will be reserved to purchase a trophy for the winner of first money in the Grand American Handicap at targets.

### The Grand American Handicap.

The Interstate Association reserves the authority to postpone the Grand American Handicap at targets on account of bad weather or other important cause if, in the judgment of the management, such postponement is necessary.

The manner of shooting the Grand American handicap at targets (and, in fact, all events scheduled for the tournament) will depend entirely on the number of entries received. However, contestants are assured that a reasonable equity will be maintained under all conditions.

### Official Score.

The official score will be kept on a score board in plain view of the contestant. It will be the duty of the contestant to see to it that the right result is recorded. In case of error, it will be the duty of the contestant in whose score the mistake has occurred to have it corrected before he fires at two more targets, otherwise the score must stand as shown on the score board. In case a contestant's view of the score board is interfered with through any cause, he may refuse to shoot until the result of his last shot can be seen.

In the handicap events ties that are shot off will be at 25

targets per man, and the original distance contestants stand at will govern.

### Cashier.

Through the courtesy of the Winchester Repeating Arms Co., Mr. Fred C. Whitney, of Des Moines, Ia., will again have charge of the cashier's office. Mr. Whitney has few equals and no superiors in this position.

### Compiler of Scores.

The office of compiler of scores will be filled by Mr. J. K. Starr, of Philadelphia. His services the last four seasons in a similar capacity is a sufficient guarantee of excellent results on this occasion.

### Special Notices.

It is requested that entries for the Grand American Handicap at targets be made in ample time to permit the sending of receipt and admission ticket, and for same to reach the maker of entry prior to his departure for Indianapolis. All entries must be accompanied by the maker's full name and address.

When making an entry by mail, remittances covering the amount of forfeit (\$5) should be made by bank check, draft, post-office money order, express money order or registered letter.

Bank checks, drafts or bills of exchange will not be received at the cashier's office in payment for balance due on entries; nor will any check, draft or bill of exchange be cashed during the tournament. This rule will be strictly enforced.

To reach the shooting grounds from hotels in Indianapolis take the Plainfield Electric Line car at the corner of Washington street and Kentucky avenue direct to the grounds. The fare is ten cents.

### First Day, June 21.

Ten events, each at 20 targets, each \$2 entrance, \$5 added. All events at unknown angles. No handicaps. Manufacturers' agents, paid representatives, etc., may shoot in the above events for targets only.

### Second Day, June 22.

Event No. 1—Preliminary Handicap.—Open to all; 100 targets, unknown angles, \$7 entrance, targets included; handicaps 14 to 22yds.; high guns, not class shooting; \$100 added to the purse. The handicaps contestants receive for the Grand American Handicap at targets will govern in this event. The number of moneys into which the purse will be divided will be determined by the number of entries received, as is fully explained elsewhere in this programme. In addition to first money, the winner will receive a trophy, \$50 of the net purse being reserved to purchase same.

Five events at 20 targets, \$2 entrance, \$25 added to each. No handicaps in events 2, 3, 4, 5 and 6, and all at unknown angles.

Manufacturers' agents, paid representatives, etc., may shoot in events 2, 3, 4, 5 and 6 for targets only.

If you want to take part in the events scheduled for this day you must make entry at the cashier's office on the shooting grounds before 5 P. M., Tuesday, June 21. Penalty entries will not be taken for these events. An entry is not transferable, and entrance money cannot be withdrawn after entry has been made.

### Third Day, June 23.

Grand American Handicap at Targets.—Open to all; 100 targets, unknown angles; \$10 entrance, targets included; handicaps 14 to 22yds.; high guns, not class shooting; \$200 added to the purse. The number of moneys into which the purse will be divided will be determined by the number of entries received, as is fully explained elsewhere in this programme. In addition to first money, the winner will receive a trophy, presented by the Interstate Association.

Regular entries must be made on or before Saturday, June 11, and must be accompanied by \$5 forfeit. Penalty entries may be made after June 11 up to 5 P. M. Wednesday, June 22, by paying \$15 entrance, targets included. An entry is not transferable, and entrance money cannot be withdrawn after entry has been made.

### Fourth Day, June 24.

Five events, 20 targets, \$2 entrance, \$5 added. All the foregoing events at unknown angles. No handicaps. Manufacturers' agents, paid representatives, etc., may shoot in the above events for targets only.

Event No. 6—Consolation Handicap.—Open to all; 100 targets, unknown angles, \$7 entrance, targets included; handicaps 14 to 22yds.; high guns, not class shooting; \$100 added to the purse. Winners of money in the Grand American Handicap at targets will have 1yd. added to their handicaps, and non-winners of money in the Grand American Handicap at targets will go in 1yd. The number of moneys into which the purse will be divided will be determined by the number of entries received, as is fully explained elsewhere in this programme. In addition to first money,

the winner will receive a trophy, \$50 of the net purse being reserved to purchase same.

If you want to take part in the events scheduled for this day, you must make entry at the cashier's office on the shooting grounds before 5 P. M. Thursday, June 23. Penalty entries will not be taken for these events. An entry is not transferable, and entrance money cannot be withdrawn after entry has been made.

#### G. A. H. Conditions.

Conditions governing the Grand American Handicap at targets: 100 targets, unknown angles, handicaps 14 to 22yds., high guns, not class shooting; \$200 added to the purse by the Interstate Association. The number of moneys into which the purse will be divided will be determined by the number of entries received. Entrance money \$10, the price of targets being included. In addition to first money, the winner will receive a trophy presented by the Interstate Association.

Regular entries must be made on or before June 11, 1904, and must be accompanied by \$5 forfeit. The remaining \$5 must be paid before 5 P. M. Wednesday, June 22. Entries mailed in envelopes bearing post marks dated June 11 will be accepted as regular entries.

Penalty entries may be made after June 11 up to 5 P. M. Wednesday, June 22, by paying \$15 entrance, targets included.

All entries must be made on application blanks, and they will be received by Elmer E. Shaner, secretary-manager, 219 Coltart Square, Pittsburg, Pa.

#### Division of Moneys.

Division of moneys in the Preliminary Handicap, the Grand American Handicap at targets, and the Consolation Handicap: High guns win, not class shooting.

1 to 10 entries, 2 moneys, 60 and 40 per cent.  
11 to 20 entries, four moneys—40, 30, 20, and 10 per cent.  
21 to 30 entries, 6 moneys—30, 20, 15, 13, 12 and 10 per cent.  
31 to 40 entries, 8 moneys—25, 20, 15, 12, 10, 8, 5, and 5 per cent.  
41 to 50 entries, 10 moneys—22, 18, 14, 11, 10, 8, 5, 5, 4 and 3 per cent.

51 to 60 entries, 12 moneys—20, 16, 13, 10, 9, 7, 6, 5, 4, 3 and 2 per cent.

61 to 70 entries, 14 moneys—18, 15, 12, 10, 9, 7, 6, 5, 4, 3, 2, 2 and 2 per cent.

71 to 80 entries, 16 moneys—16, 14, 11, 9, 8, 7, 6, 5, 4, 3, 3, 3, 2 and 2 per cent.

81 to 90 entries, 18 moneys—15, 13, 10, 8, 7, 6, 5, 4, 3, 3, 3, 2, 2, 2 and 2 per cent.

91 to 100 entries, 20 moneys—14, 12, 9, 8, 7, 6, 5, 4, 3, 3, 3, 2, 2, 2, 2 and 2 per cent.

101 to 110 entries, 22 moneys—13, 11, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 2, 2, 2, 2 and 2 per cent.

111 to 120 entries, 24 moneys—12, 10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 2, 2, 2, 2 and 2 per cent.

121 to 130 entries, 26 moneys—11, 10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 2, 2, 2, 2, 2 and 2 per cent.

131 to 140 entries, 28 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 2 per cent.

141 to 150 entries, 30 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

151 to 160 entries, 32 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

161 to 170 entries, 34 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

171 to 180 entries, 36 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

181 to 190 entries, 38 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

191 to 200 entries, 40 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

201 to 210 entries, 42 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

211 to 220 entries, 44 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

221 to 230 entries, 46 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

231 to 240 entries, 48 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

241 to 250 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

251 to 260 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

261 to 270 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

271 to 280 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

281 to 290 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

291 to 300 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

301 to 310 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

311 to 320 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

321 to 330 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

331 to 340 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

341 to 350 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

351 to 360 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

361 to 370 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

371 to 380 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

381 to 390 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

391 to 400 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

401 to 410 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

411 to 420 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

421 to 430 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

431 to 440 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

441 to 450 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

451 to 460 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

461 to 470 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

471 to 480 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

481 to 490 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

491 to 500 entries, and over, 50 moneys—10, 9, 8, 7, 6, 5, 4, 3, 3, 3, 3, 3, 3, 3, 3, 3, 2, 2, 2 and 1 per cent.

any undesirable element, admittance to the shooting grounds will be by card of admission, which can be obtained free of charge, by applying to any of the subscribers to the Interstate Association, or the Indianapolis Gun Club.

The comfort and convenience of contestants, as well as spectators, has been looked after carefully.

A warm and substantial lunch will be served on the club grounds each day for the sum of 50 cents.

#### No Lockers.

There will not be any lockers. The club house will contain a sufficient number of gun racks to meet all requirements. The management of the Indianapolis Gun Club will provide a room for guns, shells and clothing, and it will be in charge of a competent watchman; but as contestants will have free access to this room at all times, they must be responsible for their own belongings. The Interstate Association will not be responsible for guns, shells, clothing, etc., under any circumstances.

This announcement is made thus explicit in order that contestants may know just what to expect, and that they may avoid any possible misunderstanding and disappointment. A very little misunderstanding sometimes mars events otherwise successful and pleasant.

#### Shipping Instructions.

Guns, ammunition, etc., forwarded to the Indianapolis Gun Club, 121 West Washington street, Indianapolis, Ind., will be delivered at the shooting grounds free of charge.

#### Notes.

No expense will be spared to make the tournament run smoothly. The most expert and competent help will be secured, and the office force will be large and capable.

Special attention is called to the schedule of events arranged for each day. The conditions of the handicap events merit—and will of course receive—more careful study than usual.

We would suggest that all who are in a position to take advantage of the very low rates made by all railroads to the World's Fair at St. Louis, and also to the Republican National Convention at Chicago the same week as the tournament, do so. Application for reduced rates to Indianapolis on the certificate plan will not be made by the Interstate Association, as it is the general opinion that so many will use the much lower rates to St. Louis and Chicago that the necessary guarantee which is part of the certificate plan would not fill, and consequently the return rate would not be granted, which would create more or less dissatisfaction among those who held certificates.

#### Entries.

Regular entries for the Grand American Handicap at targets must be made on or before June 11. Entries mailed in envelopes bearing post-marks dated June 11 will be accepted as regular entries. All entries must be made on application blanks, and they will be received by Elmer E. Shaner, secretary-manager, 219 Coltart Square, Pittsburg, Pa.

#### Clearview Gun Club.

DARBY STATION, Pa., April 30.—There was to-day a rallying of shooters from the neighboring clubs to participate in the first of the series of nine shoots arranged by the Clearview Gun Club. The conditions were 50 targets, 16yds., handicap allowance added, two prizes, each shooter's seven best scores of the series to be counted in the competition. The possible was 50.

Edwards made the highest total handicap score of the day, 61. He broke 43, but a handicap of 18 overlapped the maximum. He and Springer, who made a total of 52, were allowed 50 only.

The best shooting of the day was done by Jack Shirey, who broke 48. Downs, the one-arm shot of the Clearview Gun Club, finished second, the second best actual score. The scores:

Al Edwards (18) 61, G. Springer (12) 52, W. N. Elwell (6) 49, Anderson (6) 49, J. Shirey (0) 48, Wherry (10) 48, Louis (4) 48, Forden (6) 48, Downs (0) 46, Bell (4) 46, Dr. Charlton (12) 45, W. Charlton (5) 45, Sibole (12) 44, Litford (10) 44, Oliver (2) 44, Billhartz (12) 43, H. B. Fisher (0) 42, Prate (0) 41, Aimen (18) 40, Nixon (7) 40, Bowen (9) 40, Dr. Cotting (9) 40, Reade (5) 40, George (13) 40, Swick (20) 40, Redman (18) 40, Davison (4) 36, Umholtz (20) 36, Murphy (0) 34.

#### Keystone Shooting League.

HOLMESBURG JUNCTION, Pa., April 30.—The main event at 15 live birds was noticeable for high scores, as is to be expected at this season of the year. The conditions were handicap rise, \$5 entrance, two moneys:

Coleman ..... 22222222222222—15 Geikler ..... 2\*222222222222—14  
Frank ..... 21221222222222—15 Shew ..... 21101022222222—11  
Budd ..... 20221122212121—14 Harrison ..... 111112102001202—11  
W T Smith ..... 221212211022112—14 Jenkins ..... \*10102221222110—11

Ten birds, handicap rise, \$4 entrance, two moneys: Budd 10, Smith 10, Geikler 10, Shew 10, Harrison 10, Frank 9, Jenkins 9, Coleman 8, Bangs 7.

Twenty-five targets, 15 singles and 5 pairs: Frank 23, Coleman 22, Harrison 21, Shew 19, Smith 14.

Twenty-five targets, 15 singles and 5 pairs: Coleman 22, Smith 21, Frank 20, Budd 20, Harrison 20, Brown 19, Shew 15.

#### Indianapolis Gun Club.

INDIANAPOLIS, Ind., April 30.—Now that the river bridge has been repaired, we expect a large attendance. We shoot every Saturday afternoon, and all visiting shooters are invited to join in the sport. Scores:

Events:	1	2	3	4	5	6	7	Shot	Broke.
Targets:	25	25	25	25	25	25	25	at.	
Medico .....	18	22	22	19	24	21	..	150	126

F. M. FARWELL.

## Answers to Correspondents.

No notice taken of anonymous communications.

Von W., Charlestown, N. H.—Is the European ermine found in this country? I have seen a specimen answering its description caught hereabouts. Ans. The true ermine is a weasel of northern Europe, allied to the European stoat and polecat. It is brown in summer and white in winter, with a black tip to its tail. Some North American members of the family *Mustelidae* also turn white in winter, and might fitly be called ermine, since apparently the name originally meant merely weasel, though there are others who think that it is an abbreviation for "Armenian rat."

## PUBLISHERS' DEPARTMENT.

#### Gettysburg and Washington.

Personally Conducted Tour via Pennsylvania Railroad.

The battlefield of Gettysburg, and the National Capital in all the glory of its spring freshness, are attractions so alluring that few would feel like refusing to visit them. It is to place these two attractions within easy reach of every one that the Pennsylvania Railroad Company announces a tour over the interesting battlefield, through the picturesque valleys of Maryland, and an entertaining stay at Washington.

The tour will leave New York, West Twenty-third street, 7:55 A. M., and Philadelphia 12:20 P. M., Saturday, May 28, in charge of one of the company's tourist agents, and will cover a period of six days. An experienced chaperon, whose especial charge will be unescorted ladies, will accompany the party throughout. Round-trip tickets, covering transportation, carriage drives, and hotel accommodations, will be sold at the extremely low rate of \$22 from New York, \$21 from Trenton, \$19 from Philadelphia, and proportionate rates from other points.

For itineraries and full information apply to ticket agents; Tourist Agent, 263 Fifth avenue, New York; 4 Court street, Brooklyn; 789 Broad street, Newark, N. J

SIX MONTHS, \$2.

NEW YORK, SATURDAY, MAY 21, 1904.

VOL. LXII.—No. 21.  
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

### OUTDOOR TIME.

By long established usage the summer has come to be regarded as vacation time—the season for living out of doors—and this idea is so firmly established that one would be laughed at, or at least regarded as a freak of nature by his employer, if he suggested taking his vacation at any time other than the summer or the early autumn. Nevertheless, strong as is custom, the world is showing year by year more originality—a greater tendency to break away from habits established by long use.

Nowadays, people who do not have to work for their living commonly leave the big cities in May, and do not return until December; yet it is within the memory of many of our readers when fashionable people left New York about July 1, and returned about September 1.

There are many of the elect who understand very well that any month of the year is good to take a vacation in, and there are some who would like to take thirty days in every month. That would not be wholesome for most people; but we do think that a vacation in summer and another in winter are wonderfully helpful to the man or woman whose pursuits will admit of them. Opposed as the two seasons are, they stimulate to widely different lives. An outing in winter means brisk and hard physical work, with its accompanying improvement in physical condition, and a return to office or avocation far better able, for the rest of the year, to perform the accustomed task. Energy is stimulated and brain is made clear, so that the individual's whole efficiency is vastly increased. The summer vacation is often an idling time, an absolute rest, which, under certain conditions, may be just as wholesome and just as recuperative as a more vigorous life.

In these days of specialization, when a man throughout the greater part of the year does the same things over and over again, the brain and muscle cells get warped and twisted from their natural condition. The chief use of the vacation is to change the work of these cells from that which they have been performing over and over again for weeks and months, and for a time to give these cells the opportunity to take up a fresh and unaccustomed set of operations which shall enable them to regain their normal condition. In addition to this variety of work—which is rest—the benefit to health that comes from natural living and from pure air are large factors in the well being derived from vacation.

For most of us, vacations will still come in the summer, during the period of great heat and when business is slack and we can best be spared from the work that occupies us through most of the year; and for most of us this time—as it comes every year—is coming now. How may it be most profitably employed? The answers to this question would be as various in character and numbers as are the readers of FOREST AND STREAM. There are men who will go to their salmon rivers in Canada and Newfoundland, or on their yachts to Europe, or to their summer homes on fair Canadian lakes, or, a little later, to the Rocky Mountains for the hunting, but most of us find it impracticable to devote so much time to our play spell. What we all should do is to move ourselves as far as possible from the pursuits and the scenes which commonly surround us, and to get as close as may be to that Mother Nature which is so far from the dwellers in towns and in cities. Most of us need, above all things, the change of thought and work which mean rest, and that change should consist of an occupation that interests and amuses. Whether it be sailing or paddling or angling or camping or shooting, it should be the thing that we have thought of and looked forward to all through the winter—the thing that has been a mingling of joyous memories of the past and of happy anticipations for the future.

No prescription can be given as to the form of outing

for 1904 for man or woman; but one thing definite may be advised: If possible during your vacation, occupy yourself with that thing that you most wish to do.

### PLATFORM PLANK IN BRITISH COLUMBIA.

THE constant growth of the non-sale of game idea, enunciated and recommended many years ago by FOREST AND STREAM as its platform plank, is an interesting testimonial to the common sense of the English-speaking people of this continent. The last adhesion to it comes from Victoria, B. C., as recently as April 29 last.

On that evening the Fish and Game Club, which comprises among its members many of the most intelligent, wealthiest, and most influential men in British Columbia, held an extraordinary session in the Driard House. At that meeting there was unanimously passed a resolution requesting the Government to amend the Game Act so as to prohibit absolutely the sale of game at any time in the Province for three years. The club predicts that, unless this is done, British Columbia will shortly witness the extinction of its game birds and mammals. There is much violation of the laws by white men, and the Indians kill unceasingly. There is much hide selling, and still more selling of heads.

A few years ago British Columbia had within its boundaries some of the very best big-game grounds in North America, but many of the settlers, with the fatuousness of men the world over, seemed to think either that the game would last forever, or else that they must hurry to kill all of it they could before anyone else had a chance to get any. So they killed deer to feed their hogs through the winter, and one man killed, cut off, and brought down off the mountains—but did not skin or clean—more than fifty large ram's heads during the winter. He stacked them up, thinking that when he got ready he would clean them and take them in to the man who had offered him \$5 apiece for them. But he never got ready. Spring came on, the weather grew warm, and his sheep's heads all spoiled.

This is the way some of British Columbia's big game went.

### THE OYSTER OF THE CITIES.

THE talk and the writing about oysters and typhoid germs of which there has lately been so much, while at first it may be harmful to the oyster trade, may, on the other hand, be helpful to those who enjoy good oysters. For years past there has been complaint among people who imagine that they know what oysters should be that the highly esteemed, old-fashioned bivalve of good flavor has disappeared from the land, and its place has been taken by a white, plump simulacrum, fair and lovely to the eye, but flat and tasteless to the palate—a real dead sea apple. From this has arisen the present day practice of drenching the oyster with vinegar, horseradish, and tabasco sauce, in the endeavor to give it some flavor.

Dr. Morris points out in the admirable note on this subject which we print to-day that oysters which have been "floated" at the mouth of streams, or, as in the large cities, have been taken from the salt water, kept in cellars, and drenched constantly with fresh water, become plump, white, and handsome, but also have washed from them all the salt and all the true oyster flavor, and very soon become, in the opinion of many veteran connoisseurs of the oyster, unfit to eat. This practice has long been known, and is apparently not objected to by the public, most of whom do not know what a real oyster is and should be. Oysters so treated are destined for use in cities, or for export to Europe, or for inland consumption.

The possibility of the oyster carrying typhoid bacteria to the eater is a very real one; yet, on the other hand, perhaps more people are killed each year by lightning than die of typhoid fever contracted from eating oysters. Nevertheless, since the danger is real, and since it is one of the most stupid things in the world to take unnecessary risks, it is the part of wisdom for all consumers of oysters to frown on the fattened bivalve.

While this condition does not prevail everywhere, it is almost universal in large cities, and still more so away from the seacoast. Yet if you go to some little New England or New Jersey or Maryland village on the coast, and eat oysters there fresh from the local waters, you will enjoy those that are delicious, and entirely

different from those furnished at the most high priced restaurants or in the wealthiest homes of New York, Chicago and Philadelphia.

It is acknowledged that to the eye the fattened oyster is more attractive than the natural darker and more shrunken one just from the salt water; but it may reasonably be urged that people do not eat oysters for the gratification of the æsthetic senses, but for the gratification of the palate.

Dr. Morris' letter performs a real service in pointing out that the fattened oyster is a sick oyster, and in thus warning the public of the truth about this delicious shell fish. The oyster dealer need not fear this truth. If his trade has been injured, he has the remedy in his own hands. Let him abandon his present methods and furnish his customers with the genuine oyster, not the diluted product of modern times. On the other hand, the consumer of oysters has the power to protect himself from the danger of eating sick oysters, and to correct the present practice of the dealers. Let him demand the natural shell fish, which the dealer can furnish just about as cheaply and conveniently as the white and tasteless article that the dwellers in large cities are now content to eat.

### ADIRONDACK LANDS.

THE decision rendered by Hon. Arthur L. Andrews as referee in certain actions for the ejectment of occupants of lands claimed by the State, is of very great public interest. It represents a step toward clearing up and settling the question of land titles in the Adirondack region. Many of these titles are more or less doubtful. Originally of no value except for the timber which they bore, the lands have been purchased and lumbered over, and sold for taxes, and bought and sold and squatted on, until, in many cases, the task of tracing back a title is one of great difficulty.

In the present case, however, this appears to have been done, and the decision as to the great tract occupied by Mr. Ladew has been in favor of the State.

No doubt he will appeal from the decision, and the matter will be carried to the highest courts. Whether the ultimate decision be in favor of occupant or claimant, it is highly desirable that the question of the title to these lands, and to all other Adirondack lands, be definitely established, and since these lands now have a value, such questions are quite sure to be determined before long.

The State of New York now possesses nearly 2,000 square miles of forest preserve, of which more than 1,800 square miles are in the Adirondack region; but this land lies more or less scattered about—a little here and a little there—interrupted by private ownership, and therefore much less desirable than if it were compact. It is to be hoped that as time goes on action may be taken to secure for the State more and more of this Adirondack land; and that, if not in our time, at least within the next generation, the State of New York may possess in the Adirondack region a beautiful public park of great extent and lying all in one body.

THE fourth volume of the Book of the Boone and Crockett Club, now making its appearance, is interesting on many accounts. It is much larger than any of the club's previous publications, and much more fully illustrated, having, we believe, no less than forty-six full-page plates between its covers. It is also notable for having a long and extremely interesting article from the pen of President Roosevelt. The frontispiece of the work is an admirable portrait of the President, and there is a sketch of him as the founder of the Boone and Crockett Club.

THE bill providing for the protection of the wild black bear in New York has added somewhat to the gaiety—if not of nations—at least of a certain part of the public press of this State. Now, however, since Governor Odell has signed the bill, it is definitely determined that the wild bear is an innocent and harmless beast, and may be pursued, taken or killed only at certain definite times and seasons. What the result of this legislation will be on the sheep and horse industry of the Adirondacks, and on the peace of mind of the local berry picker, remains to be seen; but we may feel quite sure that the opponents of the bill have not, as yet, said their last word about it.

# THE SPORTSMAN TOURIST

## Trails of the Pathfinders.—VIII.

### Lewis and Clark.—I.

Most famous of all the pathfinders of the United States are Lewis and Clark, explorers of the Missouri River to its headwaters, and of the Columbia, from its headwaters to the Pacific; and thus the spanners of the continent. They were not, it is true, the first to traverse the wilderness which lay between the Atlantic and the Pacific, but of these who bore the name American they were the first.

In 1803 Louisiana was ceded by France to the United States for the sum of about fifteen millions of dollars; but its boundaries were entirely uncertain, and neither the nation which sold nor that which bought knew what this territory included, how far it extended north or south or west, nor who nor what were its inhabitants. There were a few French, a few Spaniards, a few Creoles, together with some Americans, English and Germans, and the slaves which they possessed. Little was known of the country, save for a short distance beyond the Mississippi River; but it was obviously important to the new owners of the land to find out at once what the purchase meant to the United States.

One thing seemed certain: the population of the United States, which had already spread far beyond the Allegheny Mountains, was constantly increasing, and constantly pushing westward. The encroachments of the whites on the territory occupied by various tribes of the Indians were continual, and the Indians, naturally enough, resented, and sometimes resisted, these encroachments. Here, west of the Mississippi River, was a vast territory, unoccupied save by Indian tribes, many of whom were wanderers. The population of this unoccupied territory was so sparse that no doubt it seemed to President Jefferson that here was room for all the Indians east of the Mississippi, and one of his first acts after the cession was concluded, was to attempt to learn what he could with regard to the occupancy of this territory, presumably in the hope that all the Indians east of the Mississippi might be persuaded to move westward beyond that river.

Besides this, Jefferson had already—more than ten years before—endeavored to send out men to cross the continent to the Pacific Coast, but the effort had failed. But in January, 1803, before the completion of the purchase of Louisiana, he attempted this once more, recommending to Congress the dispatching of a party to trace the Missouri River to its source, and to go thence to the Pacific Ocean.

It is impossible for any man now living to conceive what such an expedition must have meant to the men who were to command it. Here was a vast and unknown territory of indefinite width, peopled by unknown inhabitants, uncertain as to its food supply, containing unknown dangers and obstacles, which must be crossed on foot—though the journey could be begun by boat. It is true that the rumors long before brought back from the upper Mississippi Valley by Carver suggested waterways across the continent, but these were no more than rumors, and were mingled with an amount of fable which cast doubt on the whole story. It will be remembered that Carver, speaking of the country west of the St. Pierre (Minnesota) River, says:

"A little to the northwest of the heads of the Missouri and the St. Pierre, the Indians further told me, that there was a nation rather smaller and whiter than the neighboring tribes, who cultivate the ground, and (as far as I could gather from their expressions) in some measure the arts. To this account they added that some of the nations who inhabit those parts that lie to the west of the Shining Mountains have gold so plenty among them that they make their most common utensils of it. These mountains (which I shall describe more particularly hereafter) divide the waters that fall into the South Sea from those that run into the Atlantic.

"The people dwelling near them are supposed to be some of the different tribes that were tributary to the Mexican kings, and who fled from their native country to seek an asylum in these parts about the time of the conquest of Mexico by the Spaniards, more than two centuries ago.

"As some confirmation of this supposition, it is remarked that they have chosen the most interior parts for their retreat, being still prepossessed with a notion that the sea coasts have been infested ever since with monsters vomiting fire, and hurling about thunder and lightning; from whose bowels issued men, who, with unseen instruments, or by the power of magic, killed the harmless Indians at an astonishing distance. From such as these their forefathers (according to a tradition among them that still remains unimpaired) fled to the retired abodes they now inhabit. For, as they found that the floating monsters which had thus terrified them could not approach the land, and that those who had descended from their sides did not care to make excursions to any considerable distance from them, they formed a resolution to betake themselves to some country that lay far from the seacoast, where only they could be secure from such diabolical enemies. They accordingly set out with

their families, and, after a long peregrination, settled themselves near these mountains, where they concluded they had found a place of perfect security. \* \* \*

"That range of mountains, of which the Shining Mountains are a part, begin at Mexico, and, continuing northward on the back, or to the east of California, separate the waters of those numerous rivers that fall either into the Gulf of Mexico or the Gulf of California. From thence, continuing their course still northward between the sources of the Mississippi and the rivers that run into the South Sea, they appear to end in about forty-seven or forty-eight degrees of north latitude, where a number of rivers arise and empty themselves either into the South Sea, into Hudson Bay, or into the waters that communicate between these two seas.

"Among these mountains, those that lie to the west of the River St. Pierre are called the Shining Mountains, from an infinite number of crystal stones, of an amazing size, with which they are covered, and which, when the sun shines full upon them, sparkle so as to be seen at a very great distance.

"This extraordinary range of mountains is calculated to be more than three thousand miles in length, without any very considerable intervals, which, I believe, surpasses anything of the kind in the other quarters of the globe. Probably in future ages they may be found to contain more riches in their bowels than those of Indostan and Malabar, or that are produced on the Golden Coast of Guinea; nor will I except even the Peruvian Mines. To the west of these mountains, when explored by future Columbuses or Raleighs, may be found other lakes, rivers and countries, full fraught with all the necessities or luxuries of life; and where future generations may find an asylum, whether driven from their country by the ravages of lawless tyrants or by religious persecutions, or reluctantly leaving it to remedy the inconveniences arising from a superabundant increase of inhabitants; whether, I say, impelled by these, or allured by hopes of commercial advantages, there is little doubt but their expectations will be fully gratified in these rich and unexhausted climes."

Such was the information concerning the proposed journey which Lewis and Clark possessed. But they were made of the stuff which constituted the old-time Americans; they had the sturdy independence, the unshrinking courage, and the dogged perseverance which gave to America its Daniel Boone, its Davy Crockett, and its Zebulon M. Pike; and they set out with cheerfulness, even with eagerness, to perform their task. The expedition started late in the year 1803, and proceeded up the river by boat. There were about forty-five men at the start, of whom twenty-five were soldiers, the whole company being enlisted as soldiers a little later. The baggage of the outfit consisted chiefly of ammunition, together with goods to be used as presents for the Indians. The transportation consisted of boats, one a keel boat, 55 feet long, drawing 3 feet of water, fitted for 22 oars and a sail; the other two were pirogues, or open boats, one of six, the other of seven oars. There were two horses, which were to be taken along the bank for the purpose of hunting in time of scarcity, or for bringing in game that was killed.

Having wintered at Wood River, the start was made on the 14th of May, 1804. At first their progress was not rapid. Nevertheless, before long they came to the country of the Osages. The story given of the origin of the tribe is worth repeating: "According to universal belief, the founder of the nation was a snail, passing a quiet existence along the banks of the Osage, till a high flood swept him down to the Missouri, and left him exposed on the shore. The heat of the sun at length ripened him into a man; but with the change of his nature he had not forgotten his native seats on the Osage, toward which he immediately bent his way. He was, however, soon overtaken by hunger and fatigue, when, happily, the Great Spirit appeared, and, giving him a bow and arrow, showed him how to kill and cook deer, and cover himself with the skin. He then proceeded to his original residence; but as he approached the river he was met by a beaver, who inquired, haughtily, who he was, and by what authority he came to disturb his possession. The Osage answered that the river was his own, for he had once lived on its borders. As they stood disputing, the daughter of the beaver came, and having, by her entreaties, reconciled her father to this young stranger, it was proposed that the Osage should marry the young beaver, and share with her family the enjoyment of the river. The Osage readily consented, and from this happy union there soon came the village and the nation of the Washasha, or Osages, who have ever since preserved a pious reverence for their ancestors, abstaining from the chase of the beaver, because in killing that animal they killed a brother of the Osage."

Struggling on northward, Lewis and Clark passed the Otoes and Missourias, and on June 25 reached the mouth of the Kansas—named from the Indians living on its banks—340 miles from the Mississippi. Game was abundant, and there are allusions to deer, elk, and buffalo. At the mouth of the Platte River they sent out messengers to bring in Indians, since a portion of their duty was to endeavor to make peace among the different tribes they met with. Otoes and Pawnees lived not far

off, one of the Pawnee villages being then on the Platte, while another was on the Republican, and a third on the Wolf—now known as the Loup River. Incidental reference is here made to several tribes which wander and hunt on the heads of the Platte River, and thence to the Rock Mountains; one of these is called the Staitan, or Kite Indians, said to have acquired the name of Kite from their flying; that is, from "their being always on horse-back." These Indians are, no doubt, the Cheyennes, formerly spelled in a variety of ways, of which Schians was then one of the commonest. If we imagine that the two t's in Staitan are misprints for h's, we have almost the present word. These Indians are said to be extremely ferocious, and the most warlike of all the western Indians; they never yield in battle, nor spare their enemies, and the retaliation of this barbarity has almost extinguished the nation. After these, according to our authors, come the Wetapahato and Kiawa tribes, associated together, and amounting to two hundred men. The first of these names is interesting, for it is obviously a corruption of *Wi ta pat* (pronounced We to pāte), which is the name by which the Cheyennes to-day call the Kiowas. Other tribes are mentioned, hardly now to be identified.

On July 31 a party of Otoe and Missouria Indians came to their camp, and, on the following day, a council was held, at which presents, medals, and other ornaments were given to the Indians. The point where this council was held was given the name Council Bluffs, and it stands to-day across the river from Omaha, Nebraska. A little further up the river they reached an old Omaha village, once consisting of three hundred cabins, but it had been burned about 1799, soon after the smallpox had destroyed four hundred men, and a proportion of the women and children. This dread disease gave the Omahas the worst blow that they had ever received, and, perhaps even as much as their wars with the Pawnees, reduced them to a tributary people. On August 16, two parties were sent out to catch fish on a little stream. "They made a drag with small willows and bark, and swept the creek; the first company brought three hundred and eighteen, and the second upward of eight hundred, consisting of pike, bass, fish resembling salmon, trout, redhorse, buffalo, one rockfish, one flatback, perch, catfish, a small species of perch, called on the Ohio silverfish, and a shrimp of the same size, shape and flavor of those about New Orleans and the lower part of the Mississippi."

A few days before, one of their Frenchmen had deserted, and the commanding officers had sent out men to capture him. This they succeeded in doing, but the man subsequently escaped again. On the 18th they received another party of Indians—Otoes and Missourias. The next day the first death occurred in the expedition, that of Charles Floyd, who was buried on the top of the hill, and his grave marked by a cedar post. Further up the stream, beyond the mouth of the Big Sioux River, they killed their first buffalo. Near the mouth of the White-stone they found a curious mound, described as a regular parallelogram, the longest side being three hundred yards, and the shorter sixty or seventy. It rises sixty-five or seventy feet above the plain, and shows at the summit a level plain about twelve feet in breadth and ninety in length. This, according to the Sioux, was called the Hill of the Little People, and they believe that it is the abode of little devils, in human form, of about eighteen inches high, and with remarkably large heads; they are armed with sharp arrows, with which they are very skillful, and are always on the watch to kill those who should have the hardihood to approach their residence." Many Indians have been killed by these spirits, and, among others, three Omaha Indians, only a few years before. The Sioux, Omahas and Otoes are so afraid of the place that they never visit it.

The wind blows so strongly over the plain in which this mound stands that insects are obliged to seek shelter on its leeward side, or be driven against it. The little birds which feed on these insects resort there in great numbers to pick them up. There the brown martin was so employed, and the birds were so tame that they would not fly until closely approached.

At Calumet Bluff the party was visited by a number of Yankton Sioux, brought in by Sergeant Pryor and his party, who had gone to the village to induce them to come to the river. A council was held with these Indians, and presents given them; and in the evening the Indians danced for the entertainment of the white men. To the Durions—Frenchmen who were trading with these Indians—presents were given; and they were requested to try to make peace between the Yanktons and their enemies.

Reference is made to the soldier bands of the Sioux and Cheyennes, though without much comprehension of what this organization is. It is spoken of in these terms: "It is an association of the most active and brave young men, who are bound to each other by attachment, secured by a vow never to retreat before any danger or give way to their enemies. In war they go forward without sheltering themselves behind trees, or aiding their natural valor by any artifice. This punctilious determination not to be turned from their course became heroic or ridiculous a short time since, when the Yanktons were crossing

the Missouri on the ice. A hole lay immediately in their course, which might easily have been avoided by going round. This the foremost of the band disdained to do, but went straight forward, and was lost. The others would have followed his example, but were forcibly prevented by the rest of the tribe. The young men sit, and encamp, and dance together, distinct from the rest of the nation; they are generally about thirty or thirty-five years old, and such is the deference paid to courage, that their seats in council are superior to those of the chiefs, and their persons more respected. But, as may be supposed, such indiscreet bravery will soon diminish the numbers of those who practice it, so that the band is now reduced to four warriors, who were among our visitors. These were the remains of twenty-two, who composed the society not long ago; but, in a battle with the Kite Indians of the Black Mountains, eighteen of them were killed, and these four were dragged from the field by their companions."

The list of the Sioux tribes here given includes the Yanktons, the Tetons of the Burned Woods—now called Brulés; the Tetons Okandandas—now known as Ogallalas; the Teton Minnakenozzo—Minneconjous; the Teton Saone—Santees; Yanktons of the Plains—Yanktonnais; the Mindawarcarton—Minnewakaton; the Wahpatoota—Wahpatones; the Sistasoone—Sissetons. Not far beyond Calumet Bluffs were found extraordinary earth works, said by the explorers and French interpreters to be common on the Platte, the Kansas, and the James rivers. The Puncas were next passed, above La Rivière qui Court—the Niobrara. These are said to have been largely reduced in numbers by the attacks of their enemies, and to be now associating with the Omahas, and residing on the head of the Loup and the Running Water. Above here the first prairie dogs were seen; and not long after they were rejoined by one of their men who, twelve days before, had been sent off after lost horses, and, having found them, had been wandering along the river for twelve days, seeking his party. Mention is made on September 17 of a great prairie dog town, and it is told that their presence here enticed to this place "wolves of a small kind, hawks, and polecats, all of which animals we saw, and presume that they fed on the squirrels." The whole country here had recently been burned, and was now covered with young grass, on which herds of antelope and buffalo were feeding.

On the 20th, the party had a narrow escape from being buried under a falling bank, undermined by the river. On this day a fort and a large trading house built by Mr. Loisel for the purpose of trading with the Sioux was passed on Cedar Island, and the following day Indians stole one of their horses. They had now come to the country of the Teton Indians, and, holding a council with them, had more or less trouble, which would undoubtedly have resulted in fighting, had it not been for the prudence of Captain Clark. The Indians were insolent, and were disposed to go just as far as permitted in annoying the white people. However, they were not allowed to impose on the party, and a short distance above this the main Teton village was passed, and here Captains Lewis and Clark were met at the river bank by ten young men, who carried them on buffalo robes to the large house where the council was to be held—an evidence of the highest respect. In this shelter were about seventy men, sitting about the chief, before whom were placed a Spanish flag and American flag which Lewis and Clark had given him. Within the circle was the pipe, supported on two forked sticks, about six or eight inches from the ground, and beneath the pipe was scattered the down of a swan. Food was cooking over the fire, and near the kettle a large amount of buffalo meat, intended as a present. The feast consisted of a dog, pemtitigon, and pomme blanche, and was ladled into wooden dishes with a horn spoon. After eating and smoking, a number of dances were performed. Concerning these, the very incorrect opinion is expressed: "Nor does the music appear to be anything more than a confusion of noises, distinguished only by hard or gentle blows upon a buffalo skin; the song is perfectly extemporaneous." It is, of course, well known now that these songs and dances are always the same, and never, by any chance, change.

It is noted that these Indians, who appear to have been Ogallalas, had then a fashion of dressing the hair different from anything recently known. The journal says: "The men shaved the hair off their heads, except a small tuft on the top, which they suffered to grow, and wore in plaits over the shoulders. To this they seemed much attached, as the loss of it is the usual sacrifice at the death of near relations." The dress of men and women is described, and it is noted that the fire-bags of these Sioux were made of the dressed skins of skunks. The women's dresses were not very unlike that of recent times.

After four days spent with these Indians, preparations were made to proceed up the river; but the Indians did not seem willing to let them go. They did not show any particular hostility, but were extremely irritating, and put the white men to so much trouble that they were obliged to threaten them with fighting. Even after they had at last succeeded in starting on their journey, these Sioux followed them along the river, and continued to annoy them.

Not very far above the point where they were troubled by the Sioux, they came on a village of Arikaras, with whom some Frenchmen were living, and among them a M. Gravelines. This man brought together the Arikara chiefs for a conference, in which speeches were made to them similar to those already uttered to the Indians down the river. Some presents were given, but the offer of liquor was declined, the Indians saying that they were surprised that their father should present to them a liquor which would make them fools. From the Indians were received presents of corn, beans and squashes. The following day other councils were had at other villages of the Rees; and the explorers finally left them to go up the river. The history of this tribe is given with substantial accuracy, and much is said about their habits and their good disposition.

Further up the river a camp of Sioux was passed, and beyond them a stream called Stone-Idol Creek. This name was given from the discovery that "a few miles back from the Missouri there are two stones resembling human figures, and a third like a dog; all of which are objects of great veneration among the Arikaras."

While nothing is said about the size of these figures, one wonders whether they have any possible relation to that stone figure known as the Standing Rock, concerning which the Yankton Sioux have a tradition. We have not heard of the figure of a man in connection with the Standing Rock, but there was certainly the figure of a woman and of a dog, and the woman, who owned the dog, is said to have been a Ree woman. The Yankton tradition, however, is quite different from that given by Lewis and Clark. Their two stone figures are a lover and a girl whose parents declined to permit the marriage; and these two young persons, the man accompanied by his dog, met on the prairie, and, after wandering about, were at last turned to stone. The Standing Rock, which is now at Standing Rock Agency, in North Dakota, is said to have been a Ree woman, who, after having long been the only wife of her husband, became jealous when he took another wife, and, lagging behind the traveling body of the Rees, was finally turned to stone, and remains to this day, a warning to all jealous women.

A little later during the day's journey they saw great numbers of "goats" (antelope) coming to the banks of the river. No doubt these animals were then migrating toward the mountains, or perhaps to the broken hills of the Little Missouri. On October 18 they passed the Cannon-ball River, referred to as Le Boulet; and here they met two Frenchmen who had been robbed by the Mandans, but who turned about and proceeded north again with the white men, in the hope of recovering their possessions. Game was extremely abundant—buffalo, elk, and deer. An Indian who was with them pointed out to them a number of round hills, in which he declared the calumet birds—probably the thunder bird—had their homes.

GEO. BIRD GRINNELL.

[TO BE CONTINUED.]

## Halcyon Days on the South Branch.

BY O. WARREN SMITH.

It rained, and it had been raining for three weeks; but, nothing daunted, we hitched the horses to the platform wagon and started. We were the deacon, my wife and I and our little girl, and we were in search of a trout brook of which we had often heard but had never fished—the South Branch of the Oconto River, in Wisconsin. The deacon was boss and driver, my wife was cook, I was a hewer of wood and a carrier of water, while the little girl was in every one's way and had the best time of all.

It rained, but with everything and every one covered with canvas, we pulled out of the city of Shawano, to the great amusement of clerks and the omnipresent small boy. But the running fire of remarks which our appearance called forth had no more effect on us than did the patter-patter of the raindrops. Why will people insist upon staying indoors when it rains, just because it rains? Nature, like woman, is never more beautiful than when in tears. The leaves upon the trees seem to hold themselves so that the raindrops may caress them when falling. And how the birds enjoy the downpour! We see them hopping about, chirping contentedly, or sitting on the branch of a tree with ruffled feathers, enjoying a bath without exertion. Then there is no dust, and one almost has the world to himself, so few people get out when it rains. We enjoyed the ride to the utmost, and we started out with the idea of enjoying whatever nature sent us.

Eight miles out of Shawano we came to Keshena, which is a small town upon the edge of the Keshena Indian Reservation. Here are located the Government schools, and the home of the Indian Agent, who kindly gave us a permit to fish upon the Indian lands. From Keshena we drove out to Keshena Falls, and stopped long enough to take a picture. Here the Wolf River tumbles over a granite wall twenty feet high, and after churning itself to foam, flows on calmly until it unites with the Fox River, some fifty odd miles to the south. But above Keshena Falls, rapid follows rapid, and falls follow falls in quick succession. I made a canoe trip down the Wolf some ten years ago, and I know all about it.

From the falls we journeyed northeast. The rain ceased, and the sun came out scorching hot. The sand was deep, and being wet, clung to the wheels; and to ease the horses, we got out and walked. The delight of the little one over every wild flower and wilder rabbit was contagious, and we surprised ourselves by singing some long forgotten hymn, learned in boyhood. Somehow, when we come in close touch with nature, we seem to reach back and get hold of childhood's faith, hope and love. Near to nature's heart the harsh word dies upon the lip unuttered, and the mean thought vanishes away.

At 4 o'clock we reached the river, and I must say I was disappointed. I had looked for a river, and this stream, as it seemed to me, was little better than a creek; but ere twenty-four hours had passed, I was willing to call it a river. Before sundown, the tents were up, the horses quartered in a near-by Indian's barn, and my wife had scraped acquaintance with the Indian's wife, and took her picture as she sat dreaming on the western porch of her little home.

We were up with the sun the next morning, and breakfast disposed of, we jointed our rods and began the battle. The deacon scored the first victory, with my wife a close second. I managed to snarl my line, so the little one won third place, and I was obliged to be content with fourth. So we four fished pool after pool, until the deacon called a halt with, "See, here, we have all we can eat for dinner, and a man is greedy if he takes more than he needs!" All agreeing with the sentiment, we returned to the tent. The day was perfect, so I rigged up the camera on a convenient stone, fastened a string to the release, and took a picture of our camp. To-night the snow is falling and the wind is sighing about the house; but as I sit at the desk writing, I have the picture of our camp before me, and hear only the sighing of the wind in the hemlocks back of the tent, and the rush of the trout creek below.

After dinner, leaving the wife to talk with the Indian woman, who had come to visit her, the deacon and I

hit the stream higher up. Entering the stream about three miles above the camp, we proceeded to fish down side by side. This method of fishing has the advantage of companionship, and rivalry. Each seeks to outcast and outcatch the other. Standing at the head of quite a fall, we both cast into the pool below. My line ran out with a rush, and I realized that I had hooked a big one. Instinctively, I knew that I could not reel the fish up through the rapid water, so I proceeded to walk down to net my fish. My eyes were fixed upon the fish leaping and straining in the pool below as I stepped over the little fall, and losing my balance, down, down, down, I went, heels over head, into the pool. Foolish thing to do, I hear you say, and I am willing to agree with you; but I offer as an excuse my eagerness to capture the trout and the fact that I didn't think there could be so deep a pool in the stream. Coming to the surface after what seemed an hour under water, I struck out for shore, still clinging to my rod. Climbing out on the bank, I looked back up at the deacon. You can imagine his mirth, but I could not join him in it. I began to reel in, and to my surprise I found the trout still fast. Standing upon the bank, I fought the battle out. Dripping, but triumphant, I brought the fish to net, and my joy knew no bounds when he pulled the pocket scales down at three pounds six ounces. My camera was wet, so the deacon tried to get a picture of the falls for me, but the woods were so dense that the picture is not altogether satisfactory. Nevertheless, it serves to remind me of a defeat and victory.

We fished down to camp, reaching it just as the sun sank behind the treetops, and an ideal day was ended.

That night it rained hard, and I for one lay awake just to listen to the rain dashing against the canvas. The next morning I found the following lines penciled on a bit of birch bark lying by the fire, showing that the "stilly night" had got in its work upon some one beside myself:

"Far from the haunts of striving man,  
With my tent, my gun and my rod;  
What care I for society's ban?  
I dwell in the Temple of God.

"My thoughts are not of the mart and pelf,  
But with nature's god so near,  
I commune as self with self,  
I have no fear."

The next day was rainy, and we remained in camp, reading some back numbers of FOREST AND STREAM, which the deacon had thoughtfully purchased while in town. I for one do not believe in killing myself with work while out for a rest. I had one "pleasure exertion," the time I took the canoe trip up the Wolf River, and that was enough for me. The day following the rain, the river was so high that fishing was out of the question, and we spent the day studying the birds and hunting ladyslippers, finding fifteen of the latter growing in one bunch.

The second day after the rain, the water having cleared, we began fishing, and whipped a mile of the stream before our baskets warned us that it was time to stop if we wished to retain our self respect. Returning to the tent, my wife displayed a two and a half pound trout, taken at a pool just below camp.

So the days came and went; each seemed more enjoyable than the last, and all too soon the deacon said, "To-morrow we will have to pull out for the town. I have been away from business too long already." So the ghost of civilized man entered the woods and interrupted our halcyon days. Instead of complaining, I should be thankful that the ghost had left us alone for two weeks. How dear every moss-grown tree-trunk had become! Then there was that great boulder by the river's edge, upon which I stood to draw water for the camp; standing there, I would fall to dreaming and forget all about the water until my wife's voice would remind me, "If we are to have any tea for dinner, bring that water along." Yes, every tree and stone had become a personal friend, and we were loth to part.

Once more the horses were before the platform wagon, and we pulled out. All too soon we reached Shawano. The team was placed in the barn. We saw the deacon take a north bound train, and soon after a south bound carried us home and to "business."

## Passing of the English Sparrow.

PITTSBURG, Pa.—*Editor Forest and Stream:* In a recent Scientific American Supplement, Harold Bolce, in an interesting article, "The Passing of the English Sparrow," gives the following facts, which may interest all the lovers of native bird life among the grand fraternity of FOREST AND STREAM readers and admirers. Among the most active natural enemies of the English sparrow in North America is the little screech owl (*Megascops asio*), the Canada little saw-whet or Acadian owl (*Nyctala acadica*), and the great northern shrike or butcher bird (*Lanius borealis*). The bluejay also destroys their eggs and nestlings.

All these birds should be protected, and a wide publicity given to their good qualities in this respect, as there exists a prejudice against the owls and shrike among the farmers and country people. These pigmy members of the family are too small to destroy game birds, and will rather feed on sparrows than song birds because there are more of them and they are just as succulent morsels. It appears also that the shrike has learned to imitate the distress call of the sparrow, and so decoys them. A medical scientist with the United States army, conjointly with observations made by English scientists in Australia, etc., has also found that a certain species of mosquito infects the sparrow with the malarial parasite.

All these enemies combined should succeed in reducing the ranks of the pestiferous sparrow army and make our old friends, the wrens, mockingbirds, swallows, martins, chipping sparrows, Baltimore and orchard orioles, phoebe birds, warblers, yellow and bluebirds, and a host of other departed feathered friends, to return to their old haunts and resume their minstrelsy in their native parks and woods. Amen!

JULIAN P. THE FOX HUNTER.

## Natural History.

### Snakes of the N. Y. Zoological Park

(Continued from page 396.)

It is not only in the keeping alive of rare and delicate snakes that the reptile house has been particularly fortunate. Success has been met as well in the breeding of the reptiles. Snakes are divided into two classes: those hatched from the egg, and those born alive. Usually those that are hatched from eggs are of the harmless variety. And here nature has made a wise provision. Harmless snakes multiply at the rate of from forty to eighty-five in a year, while the venomous ones seldom arrive with more than six to ten in a brood. A young venomous snake is fully able to care for itself the instant it is in the world. Its poison arrives with it, and it needs no parental care.

The fact that young venomous snakes are as dangerous as their parents was accidentally proved in the reptile house. One of the first brood of snakes to be added to the collection was of cotton-mouth moccasins, seven in number. As is generally known the moccasin is one of the most poisonous of American snakes. Next to the cage where the moccasins were born lived a harmless garter snake. One night the newly arrived moccasins crawled through the fine wire screen that divided the two cages. They made themselves at home in their new quarters, and when during their run about the cage they brushed up against the garter snake, they fell on him, bit him, and in an hour he was dead, poisoned by the tiny fangs of the little ones, who had not been in the world more than two days. One of the interesting things about the brood of moccasins was their color. The mother was of rich olive, but the young ones were rusty red, with tails as yellow as if they had been dipped in sulphur. Like all snakes grown in captivity, these moccasins, when they are full grown, will be especially valuable. Snakes born in captivity are more hardy, are easier to handle, and bring forth young that are even harder than themselves, being used to the hardships of the cage.

In the case of these moccasins, the mother takes no interest whatever in the brood. To the surprise of visitors who make inquiry of the keepers, they learn that she has not even once swallowed them to get them out of an imaginary danger. And this talk of snakes swallowing their young to protect them is, says Curator Ditmars, a myth, pure and simple. "Snakes—that is, male snakes," said he, "have been known to swallow their young, but less to get them out of a danger, real or imaginary, than to furnish themselves with a good, square meal. This has been proved several times by experiences in the reptile house. Of all the snakes that were ever swallowed there to get them out of harm's way, not one has reappeared up to date."

Not long ago five chicken snakes descended from their cage-tree and began mysterious operations in the sand under the water pan in their cage. The snakes were watched closely, and it was found that they had scooped a nest in the sand. A few days later twenty-seven eggs were found deposited in the moist spot. The eggs were of the size of pigeons' eggs, but were not covered with a hard shell. In a short time they began to grow, becoming bumpy and of the size of hen's eggs. The young inside the eggs are provided with an "egg tooth," a very sharp and tiny tooth, fastened to the lower lip. With this they cut their way to freedom as soon as they are strong enough to appear in public. In the case of the chicken snakes, the difference between the young and the old snakes is most marked. The adult snake is yellow, with long dark brown bands. The young ones are pinkish, but in time will assume the colors of the parents.

A while ago there appeared at the reptile house among the snakes intended for the commissary department a freakish brood of youngsters. Out of one batch of forty-seven young ones, four were perfect albinos, and one was provided with two heads. Seldom has anything like these snakes been seen, and great care was taken to keep them alive, especially the two-headed fellow. He was removed at once from the cage with his fellows and given an especial den of his own. There he rested on moist blotting paper, and the officers of the Zoological Society did everything possible to keep life within the precious one. But he refused to gladden the hearts of the keepers, and one morning was found dead.

The albinos, snow-white with pink eyes, thrived fairly well for a long time. In an adjoining cage was a pair of copperheads. One night seven young "red adders" unexpectedly appeared. Even before the little fellows were known to have arrived, they had wriggled through the screen separating the cages, and bitten the albinos; result, death.

After snakes have learned to eat, it has been observed that they take great notice of children who come near their cages. They will often watch a child as long as it is in sight, and on certain occasions have been seen to strike at them through the glass. After this striking, Mr. Ditmars has observed that a salivary excretion has been left on the glass, indicating, it would seem, that the snake regarded the child as an acceptable article of food. They pay no attention, however, to grown persons. They seem to choose children as being of a more suitable size.

Snakes of the boa constrictor type are caught by the natives of India and South America by means of trap nooses. When a snake has been captured, it is placed in a zinc-lined box and shipped. Usually the ocean voyage occupies from one to four months. Throughout this time the snakes receive neither food nor water. Coiling himself into as tight a package as possible, he takes the sea voyage very philosophically. If his box be held very securely to the deck he suffers no inconvenience.

On the arrival of a snake at the New York Zoological Garden, Mr. Ditmars has it taken from the box and placed in a tank of tepid water. After a bath and a long rest, the snake is taken from the water and massaged, in order to bring about a re-establishment of

the natural circulation, which has been in abeyance owing to lack of exercise.

The snake is then rubbed all over with vaseline, receiving a vaseline massage regularly for about two weeks. If the snake has been shedding his skin, all the portions of the old skin are removed. It is very essential to the health of a snake that its skin be shed periodically. From improper skin shedding snakes become subject to various skin diseases.

Sometimes it is found that these snakes are suffering from a species of pneumonia, or congestion of the lungs. This is due to change of temperature. Snakes should be kept in an even temperature, ranging from 80 to 90 degrees Fahrenheit; a temperature lower than 70 degrees makes a snake unhealthy. Besides pneumonia and skin diseases, snakes are subject to diphtheria.

Incrustations of a whitish nature form on the back of the throat. If these are not treated, the reptile will die. All the symptoms point to a form of diphtheria. This is a peculiarity which has been observed by few but Mr. Ditmars.

Though every possible precaution is taken at the New York reptile house to prevent the men from being bitten by snakes, it occasionally happens that a man will receive a nasty bite from a reptile. On these occasions the patient is given Dr. Albert Calmette's Anti-Venine. This peculiar medicine is obtained by inoculating a horse with cobra venom until the animal is immune to the poison.

At first the horse receives a hypodermic injection of a fiftieth drop in glycerine. This dose is increased until his system is permeated with cobra venom—about the deadliest poison known. The blood serum of the poison-charged horse then becomes the best known antidote for poisonous snake bites. This antidote is used by the British Government in India as a preventive in cobra poisoning.

As soon as a man has been bitten by a snake a ligature should be bound tightly above the affected part. Then drainage wounds should be made in the vicinity of the bite and below the ligature. This ligature prevents the poison from getting into the general circulation, and the wounds near the bite let out the poisoned blood.

Despite the popular prejudice against reptiles, Mr. Ditmars firmly believes that snakes were created to serve a useful purpose. He points out their great value as destroyers of harmful rodents, bugs and birds, and maintains that, were it not for snakes, many portions of the globe would be unproductive and uninhabitable.

## Short Talks on Taxidermy.

### IV.—Making up the Skin.

Now take the bird skin in the hollow of your left hand and push back first the right and then the left wing, as nearly as possible into the position of nature. Turn your hand over and place the bird on its breast in your right hand, and look at the back. If the feathers do not lie smoothly lift them up and let them fall again, and pull them a little bit, first toward the bird's head, and then toward the tail, always pushing up the wings to a natural position. At first you may not succeed in doing this very well, but it is a mere matter of practice, and you will find that, after handling a few skins, the feathers will very easily fall into place. If they do not, you may feel very sure that you have filled the skin too full of cotton, and that it is so stretched as to make the feathers stand on end. When you get the skin right, so that the feathers lie as they should, be sure you keep it so, and place it so that it will dry in that position.

There are a variety of ways of placing a skin so that it will dry well. Perhaps the commonest is to make a little semi-cylindrical trough of paper, on which the made-up skin is laid, to remain until it is dry. This is an easy and trouble-saving way, but its tendency is to make the bird's back even and round. If you use such little troughs it will be well for you to supplement them by pushing little wads of cotton down at the side of the neck and at the shoulders, and again under the tips of the wings on both sides, so that the skin will have more nearly the shape of the dead bird than if it dries on a smooth curved surface. Another and better way is to take a thin sheet of cotton, place your made-up skin in that, and gently lap the cotton over it, first on one side and then on the other. If this is properly done the bird can be placed on a flat surface to dry, the wings being supported by the sheet of cotton. You must remember that as you lay the bird away, so it will dry, and as it dries, so it will look when the skin is completed. It is a good plan to look at your skin from time to time while it is drying, and if you see anything going wrong with it, and feathers standing up anywhere, you may be able, by putting a little compress of cotton over them, to hold them down so that they will dry in their proper place.

You must be careful to have the tail flat. It must not be allowed to dry in any way askew, but should follow the line of the back straight down. If you please, you can spread the tail a little bit, but it should not be spread too wide, but only enough to show the outer margin of the feathers on both sides.

While in the adult the sex of many species can be determined from the plumage, there are others in which this affords no certain guide, and many specimens will be taken in which it will be absolutely necessary to inspect the organs of generation in order to positively determine the sex. In the spring, for example, their plumage tells with absolute certainty the sex of the male and female bobolink, but in the autumn you must have recourse to dissection to determine the question.

The organs of generation in birds lie close under the back bone, and are seen as white or whitish bodies just in front of the kidneys. The male organs are spherical or oblong, relatively large in the breeding season, but smaller in the autumn and winter, and in the young bird very small. The ovary lies in the same position, but is a single mass in which just before the breeding season the different ovules may be detected as spherical yellowish bodies ranging from the size of a No. 8 shot—in a song sparrow—down to very small granules. In the

young bird the individual eggs in the ovary are often so minute that it may be necessary to inspect the mass with a pocket lense to detect its character, while the male organs are also sometimes very inconspicuous. In a bird the size of a song sparrow the male organs in the breeding season are about the size of a pea and quite white.

It is best always to dissect your specimen and determine the sex beyond any question. To do this, cut the body of the specimen with your knife from the thigh bone forward through the ribs close to the back as far forward as to the shoulder, and open the visceral cavity, pushing the intestines to one side with the handle of your scalpel. When the backbone is thus exposed from below, you will see the purplish red kidneys lying close to it, in front of them the whitish organs of generation, and in front of these the lungs, all these organs clinging close to the backbone. If you cannot plainly distinguish the sex of your bird, take your glass and make a close inspection, pushing the organs one way and another with the point of your knife. A little care and a little practice will enable you to determine the sex every time. The sign for male is that of Mars, made thus, ♂; that for female is the sign for Venus, made thus, ♀.

The final operation with your skin is to put on it a label. This should be a slip of cardboard as small as

SEX ORGANS, FEMALE.

possible, provided it is large enough to hold the different things you wish to write on it. These should be the collector's name, the number of the skin, the locality where it was collected, the date, and the sex. There may also be a line for the name, though the name of a bird is far less important than the place, date, the sex, and the collector's name. Anyone can recognize to what species the bird belongs, and can himself supply the name, but the other data are important. You will do well to have a number of these labels, to each of which a thread is attached, and the label should be tied to the crossed legs of the bird, and rest over the tail.

This is the simplest mode that I know of for making a bird's skin. But it will not answer for certain species, such as ducks, woodpeckers, cranes, and a few other

SEX ORGANS, MALE.

birds. In these species the neck is so slender that the large head will not pass through it, and the bird's skin cannot be turned inside out. In some cases, by breaking the back of the jaw, where the lower mandible articulates with the skull, the head can be slipped over, but it is safer not to try experiments of this kind. A better way is to turn the bird as far as possible and then cut off the neck, and perform the different operations of cleaning the skin. Then, with your knife, make an incision on the top of the head, just back of the eye, and cut a median slit down over the back of the head and back of the neck, and skin down the head on either side until the base of the skull appears. Use plenty of cornmeal here, for the short feathers of the head must not be soiled or moistened by blood. When you have skinned down so that the back of the skull appears, pull out the ears and skin the sides of the head down to the eyes. By this time you can probably pull out the fragment of the neck, which may be cut off, the brain removed, and any flesh on the inside of the mouth. Then, after having taken out the eyes, poisoned the skull, and replaced the eyes with cotton, you can sew up the slit you cut, poison the whole bird, and go ahead as before.

In making a skin, the tendency of the beginner is always to stretch it. He is likely to make the necks of the small birds too long, and still more likely to stretch out the necks of his ducks or geese or herons. This is especially to be avoided. If you should wish to mount one of your dried skins at a later day, you can easily enough stretch it then, but if you make it too long you may be sure that you can never shrink it. In these long-necked birds it is not uncommon to stiffen the neck by introducing a straight stick wrapped with cotton or tow to just about the size which the neck should be. On the other hand, some taxidermists put no stiffening in the neck of a duck, but turn the neck over, and lay the head on its side on the bird's back. Others provide themselves with wires of various lengths and wrap cotton or tow about them, sometimes—in the case of a heron or other long-necked bird—bending the neck back, so that it lies by the bird's side.

The material used for filling your skin may be almost any vegetable substance. It must not be an animal sub-

stance; that is to say, neither hair nor wool will do as stuffing, because both of these are readily attacked by insects, and insects are the great enemy of the collector. It is to prevent their attacks that he uses his poison, and that he always keeps his skins, if possible, in air or in insect-proof cases. Cotton, tow, excelsior, shavings, may safely be used, and I have on a pinch employed newspaper, but I do not recommend it.

The beginner who sees an old hand skin a bird is often impressed by the rough-and-ready way with which the skin is handled. The skins of small birds seem, to most of us, very tender and delicate, and the texture of the feathers very soft and likely to be easily ruffled if improperly handled; but, as a matter of fact, the practiced bird skinner very seldom tears a skin unless it be one of extreme thinness, for example, like that of the night-hawk, and, understanding how to handle the skin and the feathers, he scarcely ever ruffles the latter.

It is well, as has been said, for the beginner to try his hand on some medium sized bird, like a robin, jay, blackbird, or meadowlark, and when he is so skillful that he can make up one of these skins readily and easily, he may try a larger or a small bird as he pleases. Small birds are much easier to skin than large ones, and the man in practice will skin a warbler in three minutes, and will average more than fifteen an hour. Larger birds are harder to skin, and it takes very much more time to do the work. While the skin of a little bird will strip easily from almost every part of its body, that of the larger one clings close, and successive strokes of the knife are required to separate it from the flesh. Water fowl almost always have a great amount of fat lying between the skin and the flesh, and this must be removed, or else, as the bird stuffers say, it will burn the skin, and after a few years grease will appear on the feathers.

TAXIDERMIST.

[TO BE CONTINUED.]

### The Typhoid Oyster Question.

IN a murder trial in the western part of New York a few years ago, the jury became so confused over the expert testimony that they brought in a verdict of arson in the first degree, although, as shown by reference to the stenographer's notes, there had been no reference to the question of arson in the testimony, or in the charge by the court.

So much is being written upon the subject of typhoid fever and oysters at the present time, that a good deal of confusion results, and some people may get to feel that their bunions were caused by eating oysters from knobby shells.

The principal question may perhaps be stated concisely as follows:

1. Oysters feed upon minute organisms, including algae and bacteria.
2. The bacteria which the oysters obtain from salt water are harmless, so far as we know.
3. Typhoid bacteria belong to fresh or brackish waters.
4. When oysters are placed in fresh or brackish waters for "fattening purposes," they collect quantities of typhoid bacteria along with their other food.
5. It is not a question of the oysters becoming infected with typhoid bacteria, but a question of their carrying a collection of the bacteria to market in their gills.
6. Nevertheless, an oyster that has been "fattened" in fresh or brackish water is a sick oyster. The reason why it is a sick oyster is because the salts in the body of the oyster are intended to maintain an osmotic balance in salty water, and when the oyster is placed in fresh or brackish water, the tissues swell up by endosmosis, and present a whiter appearance, at the same time losing character and flavor.
7. Oysters that are known to have come directly from salt water are delicious and safe, so far as we know, and

the matter is entirely in the hands of the customer. If he calls for sick and pretty oysters he can get them; or he can call for salt oysters and get the right thing.

ROBERT T. MORRIS, M.D.

NEW YORK, May 12.

### White Pelican in Massachusetts.

EAST WAREHAM, Mass., May 9.—*Editor Forest and Stream:* While in Wellfleet, Mass., on Sunday last, I saw a single specimen of the white pelican flying over the upper harbor above the railroad bridge. The bird flew almost overhead, and I noted the wide, pointed wings with black remiges, also the yellowish tinted under feathers with the long flesh-colored bill. The bird apparently came across the Cape from the northeast, sailed around over the mud flats, and disappeared behind a hill, probably continuing its way down to the main harbor and Massachusetts Bay. I have never seen this bird in the East before, and think it a rare occurrence.

WALTER B. SAVARY.

[The white pelican is very rare on the north Atlantic Coast. It has been taken on Long Island, the specimen being now, we believe, in the possession of Mr. Wm. Dutcher, of New York city.]

Hear what is told about the elephant, greatest of beasts:

"They learn things so eagerly that Pliny says that an elephant that was something dull, and was often beat for not learning well, was found acting his part by moonlight, and some say that elephants will learn to write and read. One of them learned to describe the Greek Letters, and did write in the same tongue these words, 'I myself writ this.'—Four-Footed Beasts, 1607.

### A Bear Hunt in Mississippi.

It was the middle of November. For several days we had been waiting for rain. The dogs had been gathered in from different points for the expected hunt, and were cared for by Holt Colyer at the old Cellers plantation. Charley and I had been out frequently to see them, and Holt pronounced them in fine trim. No one dared gainsay the old dorky's opinion, for he knows more about hounds and can make them perform better, and has killed more bears than any other living man.

At last the rain came. From four in the evening until nine the next morning it simply poured. This meant plenty of water in the woods for dogs, and the scent would lie well. Dogs must have water. By daylight Holt was on his way with the dogs, mounted on his large brown horse—an ugly brute, but docile and used to carrying a dead bear over any kind of ground. Charley and I took the train and left it at a little siding called Purnell. We hired a team and loaded our camp outfit and took a stave road some five miles to the bank of the Quiver River, making our camp in some shanties built by stave makers. Two stout darkies soon had a roaring fire in the large chimney, and were busy preparing our supper and baking corn-bread for the dogs. Twenty-two dogs will eat something like a half barrel of corn-meal at a feed, so that it was quite a job.

Holt did not arrive till long after dark. He had ridden about thirty-five miles, and some of the young dogs had jumped a deer and he had had a hard time to head them off. We put the pack in a shanty on a bed of leaves, gave them a good feed and nailed them up securely. The "strike dogs"—Remus, Ball, and Lyde—were destined to room with us—companions for "folks." A "strike" dog is the one that "strikes" the cold trail and follows the quarry by the scent until it is aroused from its lair. These three dogs were wonders in their way. No deer or wildcat would they follow, but this was due to severe training and the fear of Holt's long whip, for in their younger days they had run deer.

We sat by the fire and talked of days gone by. Remus knew me well, and without an invitation came and rested his chops on my knee, closed his eyes and swayed his body to and fro in the warm glow of the fire. As I stroked his fine head, I noticed that the long, delicate ears were fringed at the edges, and his jet black head of former years was speckled with gray and scarred by briars and thorns. "Poor old Remus," I said, "you are nearly done." Ball stood by the side of the chimney, in his stoical way, dreaming of the morrow, perhaps. The great scar on his shoulder recalled the day when a large bear at bay caught him with her claws, and he had to be stitched up and toted to camp. Lyde, the squealer of the pack, curled up close in front of the fire. Many a bear had she cheered on his run. She was the perfect type of the old southern hound or "nigger dog," black, with tan eye-spots, true and good as dog can be. The fire burned low. We spread our blankets, and were soon asleep.

About midnight I was awakened by a terrible outcry from one of the dogs, and sitting up in my bunk, expecting to see a panther in the cabin, heard Holt say, "Remus, you scoundrel beast, ef you don't want all your hide

burned off, keep out dem ashes." It was nearly day when I felt a cold nose on my cheek, which startled me, and turning over I saw Ball standing by the side of my bed. He was shivering, and I was anything but comfortable. Knowing what he wanted, I raised up the blanket and he piled in. I covered him up close to my back. Talk about hot bricks and water bags, a hound is the only warm thing around a camp.

We were out bright and early with the three dogs, and took our way up the river to a great canebrake, which was a famous hiding place for bruin. We had gone perhaps two miles, when Holt called our attention to a muscadine vine which had been torn from a tree and lay in a heap at the root. "See where he has pulled this vine down to get the fruit? None but a big bear could do that, but it was in July or August." We did not go far till we saw him examining a persimmon tree. "See here," he said, "look at the loose bark at the foot of this tree; he has been up shaking down the persimmons, and has scraped the bark off sliding down. Look at the claw marks on the tree, how wide apart; he is a sure enough big fellow." We came to a bayou and followed its course for a couple of hundred yards, and there, in the soft mud, was a large track, but made before the rain.

The dogs were hunting, in their business-like way, in and out of the cane, occasionally stopping to notice a suspected scent. At last Ball whimpered a little, and the other two dogs were soon with him. It proved to be a very old trail, and was soon abandoned. Remus the wise one went into the cane, and presently we heard a joyful cry from the king of all bear dogs. The others soon were with him, and we heard Lyde's clear triple challenge which made the old swamp ring with good tidings. Holt said: "Wait a minute." We did not wait half a minute till a long, clear bay ending with two short notes, told us that Ball had passed his judgment.

"Dat's he," said Holt. "Now, Mr. Charley you go through the bayou. It is only waist deep, and don't stop till you get to Oak Ridge; be quick, now." And to me: "You can run fast enough to get back to Hickory Ridge and stop where the big burned snag stands. I will go through the cane to the river, and try and head him off."

I was in my stand and ready when I heard the dogs open on the hot trail, and was assured that the quarry was roused from his bed. With gun ready I was almost sure of getting the shot, for the chase bore directly toward me, but for some untold reason they broke out of the cane a long way to my left. I had a glimpse of the bear as he came into the open, but it was a long shot, and only for a second, and he was going down that ridge at a gait that would make a greyhound wonder. As I was nearest to the camp, I discharged my Winchester twice in quick succession as a signal to the boys at camp to let the pack loose, then ran as fast as I could to intercept them and see them join the chase. Luckily, I arrived in time, and of all glorious sights! Here they came, scattered in all directions, heads and tails erect, ears cocked forward, listening to their leaders, whimpering with eagerness, and every one trying to reach the trail first.

I yelled at them, "Catch him, you rascals! Whoop him up!" When the trail was reached, what a racket they made as they thundered along the ridge, striking the palmetto leaves in their course. Holt soon joined me, and

we called Charley with the horn. Then we sat on a log and listened to the grandest music in the world. Away to the left they went, and then we heard them turn and head for the river. "They are going to Simrod's deadening," said Holt, "away across the Quiver—a desperate place grown up with young honey locust briars and cane. That is an old bear and he will rip around in that thicket, thinking to shake off the dogs, and when he finds out they won't quit him, he will steal out with a long start and leg it for home, and likely make his stand near to the place he started."

The chase was fast going out of hearing, but Lyde's clear voice could be heard above all the rest. I said to Holt, "Listen at Lyde." He said, "Yes, she is sure doin' about, and there is nothin' livin' that that pack won't put a move on."

We lit our pipes and waited. Scores of squirrels, black and gray, played about the trees and barked at us. The large woodpecker with his scarlet plume was noisy and busy; birds of all kinds—jays, woodlarks, thrushes, joo-ree birds—kept us company.

We waited patiently; no sound from the missing pack. I said that the dogs would bring the bear to bay in the deadening. Charley said they would force him out, and he would go down the river to the heavy cane on the Sunflower. "No, no," said Holt, "I think he will be back." Fully two hours had elapsed and we were getting hungry. I looked at Charley, and his countenance plainly said, "I told you so." When we had almost concluded to follow the chase I saw Holt put his hand to his ear and listen. In a moment I knew what it was, for I heard Lyde's faint cry as it floated through the still air of the swamps. Then plainer it came. Then Ball's long, clear music. Then Remus, then the whole pack burst into hearing; they were crossing the ridge to the river.

Guns were inspected; hearts beat fast. It was not long till we were assured that the game was across on our side of the water. A short run of perhaps ten minutes, and bruin was at bay.

We called the darkies from the camp, and they were soon with us with their cane knives. We worked our way onward, sometimes having to cut down the cane, until we were within fifty yards of the battle. The great brute had made his stand against a large "clay root"—where a tree had been uprooted by the wind—and was keeping the dogs off as best he could. He was very tired; his long tongue protruded, bloody red from raking over briars and thorns, his whole front was covered with red foam, and his breathing was short and difficult. The dogs tried to dislodge him, and he would lay back his ears and charge at them, when they would retreat in a hurry.

A bear at bay is the most difficult shot, so we left it to Holt. If a bear is wounded it is fatal to the dogs, for at the report of the gun every dog will go right in. When defending himself the bear keeps his head constantly in motion, and a bullet in the head is the only place that will kill him instantly. Holt shot him at the base of the brain, and in a second he was covered with dogs, but past fighting. We loaded him on the big brown horse, and took our way to camp. It was a heavy load—five hundred and fifty pounds. I went home that evening satisfied with my short hunt.

E. A. VICKROY.

## New York Zoological Society.

WE recently called attention to Mr. Madison Grant's interesting paper on the "Origin and Relationships of the Large Mammals of North America," in the Eighth Annual Report of the New York Zoological Society, which bears date April 1, 1904, and has just made its appearance. This is a handsome volume of over 200 pages, and contains a great amount of interesting matter adorned with a wealth of very beautiful illustrations. The report deals with the condition of the society, and this is followed by a number of special papers on new or little known species, and on various scientific subjects. The total membership of all classes is at present 1,333, of whom about 1,100 are annual members paying \$10 each.

The report of the executive committee shows for the year 1903 an attendance of 1,164,146, as against 731,515 for the year 1902, an increase of nearly 60 per cent. The largest day's attendance was over 34,000 persons, and the completion of the rapid transit terminal at West Farms will probably see a further increase of this attendance. The total number of animals in the collection is 1,904, divided into 536 mammals, 706 birds, and 662 reptiles. During the year the bear dens were enlarged by four new cages, and the handsome fountain given by Mr. Wm. Rockefeller, as well as the Lydig memorial gates presented by Mrs. Frank K. Sturgis, have been completed.

During the past year many gifts of great importance have been added to the collection, and among these a herd of 26 bison and a herd of elk from the late Wm. C. Whitney; 6 specimens of lama-like animals from Mr. Robert F. Brewster, 1 eland and 2 pairs of gnus from Mr. Geo. F. Baker, 1 pair of African ostriches and 5 African antelope from Mrs. Fred. F. Thompson.

Many additional buildings and improvements are needed in the Zoological Park, for which it is hoped the city will provide money.

During the year the attendance at the Aquarium was considerably over a million and a half. The city has provided funds for painting and generally improving the Aquarium, which now contains about 2,000 living specimens. A fish hatchery installed there has proved of very great interest to the public, and from it more than 2,000,000 fry have been distributed in State waters. The finances of the Zoological Society are in admirable condition.

The report of Mr. Hornaday, the Director, goes somewhat into the detail of the collections, and is very interesting. This is followed by the description of a new species of raccoon dog obtained from Japan, and now almost a year and a half an inhabitant of the garden. This is followed by the report of Mr. Chas. H. Townsend, the Director of the Aquarium, which gives a very interesting account of conditions there. Mr. Townsend gives an interesting account of the ways of the manatee, which lived for nearly five months in the Aquarium. The list of gifts, beside those already mentioned, is a long one.

The Zoological Garden offers the opportunity for study by the veterinarian and the pathologist of many subjects of great importance. The Zoological Society is fortunate in having Dr. Harlow Brooks as pathologist, and Dr. W. Reed Blair as veterinarian of its medical department, and their papers, being a general report, an article on age paralysis by Dr. Brooks, and one on internal parasites by Dr. Blair, are very interesting. Mr. Raymond L. Ditmars, Curator of reptiles, records his "Observations on Lacertilians," and Mr. C. Wm. Beebe tells of the birds which he saw on Cobb's Island.

The admirable photographs which illustrate the volume are most of them taken by E. R. Sanborn, the society's photographer.

## The Scarcity of Ruffed Grouse.

I WAS very much amused one day last fall at a little conversation I overheard. I was in the woods, not far from my house, looking for a tree suitable for a flag-pole, when I noticed two nimrods coming my way. I sat quietly down on a log to see what they were hunting.

When nearly opposite me, but fifty or sixty yards distant, one of them suddenly pulled up and discharged his gun. The other chap called over, "What'd you get, Jim?" "Rabbit," replied Jim, laconically. Whereupon he walked over to Jim to have a look at the game.

Jim had evidently been in close quarters with bunny, for the other fellow said, "Huh! Call that a rabbit?" "Sure," said Jim. "What do you call it?"

"Well," said the other, "I suppose it's a rabbit all right, but it looks to me like a hamburger steak with whiskers."

I have been much interested in the reports from various places in New York and New England on the ruffed grouse and woodcock. In Rensselaer county there has been a closed season on grouse for five years, and although there are more grouse in this immediate vicinity than there were when the closed season went into effect, it is an indisputable fact that the grouse do not multiply as rapidly as they should.

In Washington county, in covers where we last year left 15 or 18 birds, only 20 to 25 birds could be found this year. Of course, the ruffed grouse, like all of the feathered tribe, have many natural enemies, and taking these with the "man with the gun," the grouse have rather a hard row to hoe; but even at that, they do not seem to increase as much as they naturally should.

I have always lived on a farm, and have been a shooter of ruffed grouse for twenty years. Fifteen or twenty years ago the grouse (if my memory does not play me pranks) used to have twelve or fifteen young or more in a brood; but to-day six or eight seems to be the usual number.

Although FOREST AND STREAM wants facts concerning the scarcity of grouse, I cannot refrain from advancing the theory that in localities where the ruffed grouse is reduced to a few individuals, they interbreed so closely that they degenerate, and are slowly but surely working to extinction.

While the ruffed grouse of to-day is the same bold, dashing warrior as of yore, I must say that, as Mr. Samuels in a recent number of FOREST AND STREAM notes a decrease in the size of salmon and other game fishes, so I notice that the number of young in the broods of grouse of to-day are not more than 60 or 70 per cent. of what they were eighteen or twenty years ago.

I do not mean to say that the above cause has made

the grouse so exceptionally scarce in some localities during the past season, but I want to convey the idea that in the more thickly settled districts the ruffed grouse is becoming so scarce that there is not new blood enough to keep the young birds in a strong and healthy condition.

All through the farming districts of this part of New York State there is plenty of cover, and apparently an abundance of food suitable for grouse, and it is a deplorable fact that they are not more plentiful.

A close season of two or three years is a very good thing, but it is not long enough to give the birds a good, permanent start. As a means of saving the grouse, I would advocate an open season only once in three or four years, and then but for a few days. This, of course, would seem a very harsh measure to some sportsmen, but to preserve this noble game bird for future generations will require a good deal of unselfishness on the part of all true sportsmen, and the time to commence is now at hand.

As to the woodcock, I have not heard of any big bags being made here; but, on the whole, the prince of our game birds has been more in evidence the past season than for three or four years.

I have never seen mention in any of the sporting papers of the cold wave on the South Carolina coast in February, 1899, in which thousands of woodcock perished, as reported by Mr. A. K. Fisher in the Year Book of the Department of Agriculture for 1901.

HARVEY C. CAMPBELL.

[The cold wave referred to was noted in FOREST AND STREAM, and has often been commented on as a great cause of woodcock destruction.]

## Why Such Bad Shooting.

NOVEMBER 10, 1903, we went into camp. By we, I mean the old "big four"—S., M., W. and myself, and with us came His Honor, the Judge, who had not previously been one of our party. We located at our old camp, near Hornby, Minn., where we had been doing our large game hunting for several years, and never with anything but good success.

The first snow of the season had fallen on the 9th, and the prospecting we did on the eve of our arrival at camp gave us assurance that there were deer enough in the immediate neighborhood to make the quota for each of us. It was therefore with great expectations that we started on our tramp the next day. These expectations were rudely blasted by a streak of pretty hard luck, combined with some of the poorest shooting ever known.

We worked the woods and burned country each day from the start until we left camp on the 18th, and the only things to the credit of the camp were two deer, taken by our friend M. The others of us failed miserably, and for the first time in ten years I left camp with a large goose egg to my credit.

I saw deer each day of the hunt; none of them at any great distance, and none but what even a greenhorn should have been able to have taken. The others of our party were in the same fix, and none of us could bring in the good news of a capture until M. got his, which was on the 14th. Long before this we had come to the conclusion that there was a "hoodoo" of large dimensions in the camp, and as the Judge left for Skibo to spend a couple of days the morning that M. got his deer, we naturally came to the conclusion that he had taken the stranger with him.

Not so, however, as he had no more than landed at Skibo before he put on his "war togs," and before he quit Sunday night he had three deer to tell about, while we had no more than the ice broken, and, so far as myself was concerned, things had gone from bad to worse. My opinion was—and still is—that had I been shut in a barn I couldn't have hit the side of it. This was confirmed on the 15th, when I took a shot at a deer not over a hundred feet away—missing it clear.

What made matters worse, was that there were three of the party with me, and all near enough to see the whole performance. They told His Honor, and between them things were made pretty warm for me during our stay in camp. His Honor, especially, became very sarcastic in his remarks about what good hunters some folks thought themselves, and advised a little practice with a toy gun.

Unable to stand the persecution, I concluded to take a couple of days alone and visit a friend, who was camped about eight miles east, and see if things would clear up some. His Honor suggested that S. go with me, as people who didn't know how to use a rifle should have someone along to look after them in case of accidents. So S. went. With me also went the hoodoo. Neither of us scored while away, although we saw plenty of deer, and the tracks of several moose.

On the morning of the third day we returned to camp, empty-handed, and were subjected to another round of chaffing. Our friend W. came in for his share of it, as he had not yet scored.

We broke camp on the 18th at 6 P. M. His Honor and myself went to Skibo to spend the balance of the season with my brother George. On the 19th His Honor received an urgent call home, and concluding that he had his twenty-five dollars' worth, he left us. I did nothing but rest up for the balance of the week. Friend M. came down on Saturday, and we three—M., George and myself—took the field—I with the intention of getting a deer or breaking a leg.

I got the deer and near broke the leg. That deer will be remembered a long time as being the toughest old buck ever taken in that part of the country. He dressed 275 pounds, and not an ounce of fat on or in him, and was so tough that a meat grinder refused to operate on him. We gave the meat to friends who asked for it, not offering it to anyone until they had asked, and explaining that it was a bit tough.

This was all the hunting I did until the 28th, when I got two deer, both of them quite difficult shots. This raised my stock to par, and made me feel like old times once more.

That day I saw moose signs, and on the morning of the 29th George and I went out to finish the season. Nothing but moose for myself, but anything for George, as he still had one deer and one moose to get to fill his list to the quota. He got a deer, and the moose not showing up, I got nothing, so we quit. This ended the season for me, as I left for home on the 30th.

Will someone kindly come to the front with an explanation of such poor shooting as I did during the first part of the season. I lay it to the lack of practice, as I did not use my gun during the time from November 30, 1902, until the year following.

J. P. B.

## Use for Reindeer Hair.

ON a number of occasions efforts have been made in Norway to use the hair of the reindeer to manufacture textiles. None of these efforts have succeeded on account of the brittleness of the hair. The only use to which reindeer hair has yet been successfully put is as filling in life-belts, cushions, and mattresses for use on board ship. Each hair, being a wide cylinder, contains a great deal of air, and its buoyancy is said to be greater than that of cork. This same quality, though in greater degree, is possessed by the hair of the antelope of the West, and, to some extent, of the mountain sheep.

## Bear Near Town.

OAKMONT, Pa., May 10.—*Editor Forest and Stream:* Two weeks since there were two bear cubs, about the size—and looks—of ten-week-old collie puppies in a shop window in Morganton, North Carolina, the dam having been killed about twelve miles from the town. They were very much alive at boxing and similar cub amusements.

Morganton is one of the oldest towns in the State, Sevier, the Governor of the transitory State of Franklin (or Frankland) having been put on trial for his life in the quaint old court house still standing there.

WM. WADE.

## Important Adirondack Decision.

HON. ARTHUR L. ANDREWS, Corporation Counsel of the City of Albany, has handed down his decision in fifteen actions brought by the State against occupants of land along the shore of Raquette Lake, in Township 40, Hamilton county. These actions were for the ejectment of the occupants, on the grounds that the lands in question belonged to the State. They were begun under the direction of the Forest, Fish and Game Commission by Lewis and McKay, of Rochester, in the fall of 1901. Originally there were thirty of these actions, but in several of them the defendants suffered judgment to be taken by default. In others the defendants, after having appeared in the actions, entered into a stipulation that the plaintiff should have judgment for the possession of the premises described in the complaint, but without damages and without costs. Fourteen of the actions were vigorously defended by Judge Lyman Jenkins, County Judge of Warren County, with Frank L. Bell, of Glens Falls, as counsel. In the case of the People vs. Joseph H. Ladew, one of the most vigorously defended, because the lands involved were of the greatest value, and the question raised the most important, the defendant appeared by Messrs. Parsons, Sheppard & Ogden, of New York City, who retained George N. Ostrander, of Albany, and Senator J. P. Allds, of Norwich, as counsel to defend the action.

The issues raised in these actions involved the title to upward of 26,000 acres, being the entire township known as Township 40, perhaps the most valuable in the whole Adirondack region, containing Raquette Lake, one of the most beautiful lakes of the Adirondacks, and covered with a virgin spruce forest, no part of which has ever been lumbered. The State held title to this township largely by reason of tax deeds acquired under tax sales made years ago. The defendants attacked the validity of these tax deeds, and in some cases asserted title in themselves, either by deed or by adverse possession.

In the Ladew case, in addition to other defenses, defendant claimed by virtue of a contract of sale, which it was claimed had been entered into by the State through the former Board of Land Commissioners with Ladew's grantor, Charles W. Durant, Jr. The issues in all of these actions were referred to Hon. Arthur L. Andrews to hear, try and determine. More than eighty witnesses were sworn upon the trial of the actions. Testimony was taken at Albany, Raquette Lake, Long Lake, New York City and Guilford, Conn. At Guilford the testimony of Rev. W. H. H. Murray, many years ago famous as "Adirondack Murray," was taken in behalf of the State, the referee and counsel for the respective parties having found it necessary to go there for the purpose of procuring Mr. Murray's testimony on account of his serious illness, from which he soon after died.

Over a thousand pages of testimony were taken in the progress of the trials, and during the progress thereof it was necessary to examine the proceedings of the Boards of Supervisors in Hamilton county as far back as 1859, and hundreds of pages of documentary evidence from these sources were introduced and submitted for the consideration of the referee, in addition to the testimony given by the witnesses. The original source of title was traced back to pre-revolutionary times, and in connection therewith it became necessary to examine statutes and produce maps and surveys, and other evidence in that connection, dating as far back as 1759.

In Referee Andrews' opinion, which is a very elaborate and interesting document, he sustains the State's position on every essential point. The tax deeds are held by Referee Andrews to be good. As to the defendant's claim of adverse possession, the referee holds that there could be no adverse possession as against the State since the passage of the act of 1885, which provided that lands in Hamilton and other counties should not be purchased, leased, or taken by any person for any purpose, but should thereafter remain wild, uncultivated, unoccupied forest lands for the benefit of the people, which provision was incorporated into the Constitution of 1894, and made applicable not only to the counties specified in the act of 1885, but to the whole Adirondack Preserve. In the Ladew case the referee holds that there was not, and never had been, a contract between the State and Ladew or his predecessors, under which the title to the property claimed by him passed from the State.

## New York Game Bills Signed.

GOVERNOR ODELL has signed the following bills amending the forest, fish and game law:

Assemblyman F. C. Wood's bill (792—832), providing for restocking the Adirondack region with wild beaver.

Senator Townsend's bill (12—853), providing for the protection of wild black bear.

Assemblyman Dickinson's bill (160—883), relating to the close season for hares, rabbits, trout, etc., in Cortland and Genesee counties.

## New Publications.

Shooting. Edited by Horace G. Hutchinson. Two volumes, each about 325 pages. Illustrated. Chas. Scribner's Sons.

Although this is an expensive work, it is one that every gunner should have in his library. It deals fully with sport in England, where they have carried shooting with the shotgun far beyond anything that we Americans know about. The first volume deals with the pheasant, the partridge and the grouse, and all the detail which goes with these different sorts of game, from the rearing of pheasants, partridge and grouse to the management of covers and moors and the shooting and loading of guns.

The second volume is devoted in part to wildfowl shooting, and in part to such less important game as the hare, the rabbit and wild pigeons, with chapters on week-end shoots, planting covers for game, motor cars for sporting purposes, the game laws, and shooting accessories. No one can read these two volumes without acquiring a vast fund of information concerning sport in Britain, and incidentally learning much that may be useful to him on this continent as well. The illustrations are numerous and beautiful. Price, \$7.50 net.

## When the Fishes Bite Best.

Editor Forest and Stream:

In a recent issue, your correspondent, in discussing the question, "When Do Fish Bite Best," asks for the experiences of brother sportsmen.

Probably no question known to angling lore has been argued and reargued more vehemently than this; and it is safe to say that any writer who endeavors to answer it by arbitrarily laying down any universal rule, even for a particular species, would be treated with little ceremony by the contributors to FOREST AND STREAM.

No two anglers ever lived who agreed on everything connected with the craft, and fortunate it is; for if they did, what pleasure would remain in angling? What would happen to the element of chance—the "luck," the caprices of the fish, the personal equation and individual experiences of the fisherman—if the sport were to be confined in its scope by certain inflexible rules which must be obeyed with mathematical precision? Tackle dealers may still continue to invent such barbarous mechanical devices as spring gaffs and triple gangs; they may do their best to reduce the old conservative sport to mere "practical angling," but no such evil inventions can ever affect the theory of angling or the individual whims of the fisherman. There, at least, we are still secure from the growth of industry.

In our knowledge of fishing we are, after all, little more than creatures of circumstances, and often a small thing will rudely shock our faith in some ancient precedent or tradition. Another similar occurrence and we become doubtful, perhaps mildly skeptical; while at a third occurrence we openly repudiate the rule with all its teachings. Then we have made a piscatorial discovery, and a little theory of our own is formulated. Who among us has not his own pet notion, known only to himself; one which will be stoutly maintained by argument as against all others? Be it as to the style of the fly or its size, or the quickness of the snub, or the precise manner of transfixing a worm, or the length of the cast, or the clearness of the sky above, or the water beneath, or be it the times and seasons when fishes bite best, who among us, I ask, does not delight in his own especial crankism? The theories of our friends may fill their creels with trout, they may even become so universally accepted as to establish precedents, but only so far as they prove successful with us does our faith in them continue. We are always searching for a hidden secret—seeking out a better way—and truly, angling might well be termed the mother of investigation.

A few seasons ago an inexperienced friend of mine went bass fishing with a veteran of fifty years' experience in the game fields, and the latter (as small frogs were the bait) cautioned against snubbing too quickly at the strike. The tyro, in the excitement of a nibble, forgot instructions, and jerked valiantly at the very first tug, thereby looking and landing a lusty 3-pounder, while the veteran lost one probably many pounds larger. A second nibble produced a similar result, and at evening the score stood eight to four in favor of the tyro. That was eight years ago. Since then he has fished many rivers and might well be termed a veteran, but with big-mouth bass he never fails to strike quickly, trusting to a little theory of his own.

Another friend, who spent two weeks last summer in Newfoundland, swears by the infallibility of the dusty-miller for salmon. Why? you ask. Well, we must not judge too hastily, for perhaps he has a right to his opinion. It killed three 10-pounders and several grilse the very first day out. Naturally he repeated the experiment again on the second day, and again on the third and fourth, always with the same result—good luck. And now, if questioned as to the standard fly, he replies, with a knowing look, "Dusty-miller." I have fished that same little river in Newfoundland, but fate decreed that I started with another fly. The fish rose well, and continued to rise; so now I swear by the silver-doctor (or Jock-Scott). But who is right? Did it depend on the caprices of the fish, or were the water conditions the same at different parts of the stream; or was the sky brighter at the falls; or was it merely because we each stuck to the fly that gave us luck at the start? Probably any standard salmon fly would have done the trick just as successfully—who knows? But one thing I do know, is that next July many a salmon will see a silver-doctor skipping innocently over the surface, while my friend's book, I am sure, will be found weighty with dusty-millers.

One fisherman makes his record catch near sundown, and for some time thereafter possesses a sneaking fancy for sunset fishing; another kills his heaviest salmon at 3 P. M., and, despite the scoffs of his companions, may be seen each day for a week industriously whipping the same pool at precisely the same hour; while yet a third seeks his tent in a rain just as his friend pulls on his waders for a try at the "steady." A fourth likes a cloudy day, a fifth prefers it sunny; a sixth unjoins his rod when the wind shifts to the eastward, while his comrade endeavors to duplicate the success of a past experience.

Thus only in angling are such strange anomalies presented. Our faith in the fishes themselves is implicit, but our faith in the advice of a learned treatise or the theories of a friend is certain to vanish before a single

occurrence to the contrary in our own experience.

And now, as to the "times when fish bite best." Early in the summer of 1902 I spent the greater part of a month industriously trolling for maskinongé in the waters of the Kawartha Lake system. The fish average rather small in those lakes, rarely exceeding twenty pounds in weight, but they are sufficiently plentiful to insure good sport. About forty were taken altogether, and fully twice that number struck the spoon, only to escape in the thick weeds which make fishing in those waters exceedingly difficult. But of the total 120 odd fish, hardly two dozen bit between the hours of 10 A. M. and 5 P. M., although each day I trolled persistently from early morning until dark. In that locality the same might be said of the black bass (small-mouth), only in a less degree; and, by the way, I have never found bass that averaged larger or hungrier than at Pigeon Lake. Of course, there were exceptional times when schools of them were encountered which bit well right in the scorching midday heat, when no morsel, however tempting, would have budged a maskinongé; but, as a rule, and in common with other localities, the bass fishing was perceptibly better before 10 A. M. and after 5 P. M. I then left the Kawartha lakes and continued on up the St. Lawrence, stopping off for a few days at the Grande Décharge of Lake St. John for a try at the ouananiche. This side trip was but very brief, and consequently my experiences cannot be accepted as criteria for the times when ouananiche bite, but during my short and very pleasurable stay at the Grande Décharge there was no hour of the day which could have been called better than any other. Possibly the bright rays of a hot sun were neutralized by the wild whirl of foam and rapids where the fish lurked, for they rose just as frequently at midday as in the early morning or at sundown. Pushing on to Newfoundland, I stopped off at Terra Nova Lake for a few days while waiting for the caribou to peel their antlers. There are brook trout in Terra Nova Lake, plenty of them, and some monster ouananiche besides. The latter proved very shy of the hook at all times, but with the trout it was different, and great numbers of them could be taken at the outlet, but only very early in the morning or after sundown. The small trout in the streams of the interior, on the other hand, were equally voracious at all hours of the day.

When I went to Newfoundland in June, 1903 (one never goes once to that country without trying it again), it was my intention to rise early and be at the pool each morning regularly at sunrise. After a week of actual experience, however, all such vain notions were dispelled, as the salmon not only proved very late sleepers, but their indifference to the fly was so apparent before 9 A. M. as to amply warrant a nap on the part of the fisherman himself. Once, it is true, my companion did kill a good fish at 5:30 in the morning, but that was an exception—an exception which even the more clearly demonstrated the truth of the rule itself, for it brought me out of a warm tent and into icy water at sunrise for four successive mornings without so much as a swirl from the salmon in response.

During a sojourn of six weeks on the island, I found that casting was usually best during the late morning, then again from 5 in the afternoon until dark, and on one occasion I actually struck a good fish well on toward midnight. It was one of those bright, calm evenings, the stillness broken only by an occasional great splash down in the pool below. The salmon were leaping in the moonlight, and it were truly heartless to allow such a call to remain unanswered. So, accordingly, rolling from the blankets, I slipped on a pair of caribou "shanks," and, taking my stand on a boulder, cast out from shore. It was a hasty act, and I had ample time to repent it at leisure, for I might have known that it is always at such inopportune moments that the big fish strikes. Sure enough, at the third cast I had him going down stream like a runaway locomotive, while he had me, minus boots and waders, waist-deep in the chilly pool. Well, I don't know just how long I stood in that icy water, or how many times I thought of the camp-fire far away, or how often I barked my shins on the jagged rocks, or exactly the place where I wished that cursed salmon, but I would not have missed it for the price of a dozen pairs of waders. But, to make a long story short, after an acquaintance of some twenty minutes, we parted company there in the moonlight, and I clambered back over the stones a sadder, wiser, and much colder fisherman. That was a bitter experience, but not entirely without its lesson, for it adds still a little while to "the times when fishes bite best."

Up in the Province of Ontario there is a group of weedy little lakes, as yet free from the dangers of the summer hotel, and securely hidden from all but a few of us who have searched them out. They are small, those lakes, and, to a casual observer, would seem to possess but few pretensions to scenic charm or picturesque beauty; hardly extensive enough to be dignified by any term other than mere humble ponds. But when viewed through the eyes of a fisherman, and especially of a "big-mouth" fisherman, their scenery would be pronounced unsurpassed by any waters in Canada—such scenery as is dear to the heart of a man with a rod, a kind which is suggestive of fish. Their shores are deeply indented by shallow coves thickly carpeted by a luxuriant growth of

lily pads. Here and there tangled tussocks of tall, rank grasses poke their heads above the surface, while far down beneath lie the great weed beds, acres broad, where pike lurk in sunny weather. And there are old stumps, too, along the banks, blackened and decayed by years of service as safe retreats for many a big "Oswego."

Some years ago I fished one of those ponds for four successive seasons, and verily believe it to be the last retreat and happy hunting grounds where all good "Oswegos" finally assemble—but that is another story. Early in the season, before weeds had filled the coves to any extent, the bass, hungry from a long fast on the spawning grounds, affected the deeper water. Here they were taken by gently drifting up and down with live bait, and, strange as it may seem, our best luck came neither early nor late, but in the morning between the hours of 9 and 1. Fully two-thirds of our total catch was usually made before "boiling the kettle," and at all times the late morning fishing proved so much better than the earlier or even the sundown sport as to provoke comment at the time.

As the season advanced, our bass betook themselves to the shelter of certain well known lily pad coves, shallow weed beds and partially submerged logs along the shore. These latter were always at a high premium as the choicest of all retreats for large fish—strongholds maintained *vi et armis* against all comers; and many a grumpy old 5-pounder must have been heartily envied by the less fortunate youngsters whose only protection from the sun was a humble lily pad or cowslip. Here, trolling being out of the question, a different method was pursued, one which for pleasure and skill ranks only second to fly-fishing itself, and that is bait-casting with frog or minnow. Hardly an hour of the day could have been called better than any other, for success did not seem to depend so much on the caprices or appetites of the fish (so frequently the case with small-mouth) as it did on the probability that a bass was on the watch behind some particular stump or lily pad; and if present he was always ready and willing to contribute his share of the sport. Time and again, a light wind blowing, I have landed half a dozen big fellows during the midday heat with not an additional fish for a whole afternoon of persistent casting. But during those weeks of hot, listless weather in August, when the grasshoppers drone their monotonous midsummer song, and the nearly stagnant water is calm and placid as a mirror, then, and then only, is the sundown fishing best—yes, far the best. But in 1901, after three seasons of futile effort, we hit upon a reasonably successful method for taking bass in such weather—a method which, incongruous as it may seem—improved in direct proportion as the sky became brighter and the water glassier. Quietly anchor your punt within good casting distance of a bunch of pads or weed bed, remove the sinker, tie on a nine-foot single gut leader, attach a lively frog to a small hook, and gently cast him forth, allowing him perfect liberty to swim at pleasure on the surface—then wait patiently. Sometimes it is but five minutes, oftener ten, and should fifteen elapse the boat should be moved a few rods to a more favored spot for another cast; but when he does come, it is with a great splash on the surface—a veritable trout splash. Of course, for such fishing the weather conditions should be perfect to insure the best success; absolute calm, a clear, bright sky, and, above all, reasonably shallow water, for everything depends on the ability of the fish to see the frog from their retreats among the weeds or lily pads.

There are pike in those northern lakes, too; fine, lusty fellows, and hungry betimes as well, but very sluggish in disposition during sunny weather. A pike at midday, snugly hidden far down among the weeds, will rarely investigate a spoon quickly moving some yards above him, but an animated frog, one of those lean, lank, yellow-spotted fellows, drifting slowly within six inches of his snout, is a very different proposition, and even in the sunniest weather a method may be employed with reasonable success by the persistent fisherman who fears not the torrid midday rays and wishes to make every hour of his vacation tell. Old "Swego" Vanderburgh, sage and philosopher of Charleston Outlet, secretly confided it to me one afternoon as, hidden under a protecting rocky ledge, we whiled away the weary minutes of a thunderstorm. It is not a new method to the craft; but anglers are few back there in those Ontario lakes, and old "Swego" reasoned it out and then tried it all by himself. In short, at midday, pike should be sought in their mid-day haunts far down among the great beds where the water is deep and cool, and where sun never penetrates. Over such a spot you should quietly anchor, just where the ten-foot weeds are visible beneath the surface, and still-fish with frog, or perch, or minnow. It is not, strictly speaking, still-fishing, either; but, more properly speaking, a combination of the latter with casting, as your bait should be kept slowly moving well down over every square yard of the bottom. To safely bring one-third of the pike hooked to the landing net amid such surroundings is difficult, but to land one of those great weeds every minute or two is no trouble whatever, and such fishing should only be attempted by one of gentle disposition and calm serenity of temper. But toward sunset, when the first cool shadows of evening commence to creep out from under the thick foliage on the western shore, then it is

time to replace your hook by a small star or kidney spoon, and to troll silently back and forth over the weed banks; and see to it that the hooks be sharp and your line trusty, for at such a time many a fierce tug will be felt, and many a fierce "water wolf" should feel the sharp prick of your gaff.

It is only after such experiences oft repeated that we at last really come to know a pond—to learn the true significance of "pickerel weeds," and long, rank grasses growing thick about the bottom, of sloping logs and shadowy rocks, and all the fickle twistings of the shore. And then only do we begin to understand a little about the life of those mysterious, elusive creatures that lie hidden somewhere in the water beneath. We could each tell the precise spots where a bass has rushed frantically for our frog, and the identical weed or stump behind which some gaunt pickerel lurked; and we could each point out only too well the exact places where big fish have escaped—those largest long fellows that might even now—who knows?—be lurking there awaiting in silence some perch or foolish frog to cross their paths. One learns a good deal by following the banks around all the points and exploring all the coves; and one can see a lot if he will look steadily into the lake's darker depths along the shore. It is then that he will begin to find out rare truths, and some of those things that are not printed in books—the peculiar sloping of a submerged log; the significant circle of green pads covering a cove; the calm and mystery of a shadow falling black upon a pool. Then only will he understand the charm and fascination of the sudden deft dropping of a frog to one of these.

In such a way only does one really learn to know the meaning of the water and the shore, and the rocky ledges and the deep pools; in fact, all those significant signs which forever stamp some inland pond upon our memory. In such a way only do we think out our own little theories and notions, and discover, each for himself, "the times and seasons when fishes bite best."

WM. ARTHUR BABSON.

## The Way of the Fish in Stream and Sea.

Editor *Forest and Stream*:

The theory advanced in your issue of the 14th ult., that migrating fish are guided to and along their natal streams by some distinctive peculiarity contained therein, and derived from the territory drained, seems to find some support in the behavior of the shad of the Connecticut River. This river, in emptying into Long Island Sound, discharges its current to the westward, or at right angles to its landward course, and in former days, when the run of shad was abundant, nets, in some instances extending a mile into Sound waters, were stretched at intervals for a dozen miles along the track of the westward flowing current. The shad, approaching from the east, proceeded in a direction parallel with the current, entered it at its furthest end, and then retraced their course to the river's mouth. Obviously, if there was not some clue afforded by the current itself, the fish would not burden themselves with a loop of over a score of miles, but would proceed direct to the river's mouth. After the current eludes human perception by its dispersion in salt water, it doubtless escapes through the eastern or nearer and broader entrance to the Sound to then lose itself in the ocean waste; and it is some peculiarity of the attenuated river water that the fish seem to follow up through sea and sound. This fluvial characteristic may be due to distinctive mineral particles, which, retained in solution far out to sea, may be revealed to the delicate perception of the fish, and so guide it from the deep to its bourn.

Fish, by the motion of their gills, are constantly in the most intimate contact with the medium in which they exist, and in the unceasing passage of large quantities of water over delicately perceptive surfaces, it can be assumed that a cognition of certain minute peculiarities may be imparted by a sense akin to, but probably distinct from, taste or smell. A bloodhound that unerringly follows a man's track, after two days' exposure to the wind and sun, cannot with certainty be said to be guided in its quest by what we know as an olfactory sense. Even when the trail leads the animal over the flagstones of a busy street, it may be distinguished from thousands of others; but it is unlikely that, out of a great multitude of odors of varying degrees of strength, one in particular is recognized as such. Just as with increase of shrillness sounds pass beyond our auditory sense, to then become revealed to other and more perceptive creatures, so there may be emanations that, while ceasing to be odors, are nevertheless impressed upon the animal consciousness. The susceptibility of the fish, like that of the bloodhound, may be a recognition of subtle differences in objects by a perception of exhalations too ethereal to be classed as odors or flavors.

An odor or other material impartment to water should be more abiding than its communication to the mobile and inconstant air. The atmosphere is so permeable to the sun's rays, so tolerant of their chemical action, that its purification is more rapid than that of water. A fish, therefore, by reason of the presumptively stronger stimuli thus afforded, should be, and doubtless is, as efficiently served by its perceptions as a mammal, and possibly to even a greater degree.

An inherited memory of an odor or of an emanation akin thereto, such as appears to be the endowment of anadromous fish, is no more extraordinary than that of a sound. A chick from an incubator will fly to a clucking hen, and a turkey chick will exhibit fear upon hearing the cry of a hawk, the action of each infantile creature being instinctive and untaught. Whatever may be the particular perception that guides the wandering fish to their native streams, be it odor, flavor or a subtle cognition unknown to us, there can be little doubt that, in its specific application, it descends as a heritage. The salmon of the Yukon or the Columbia that, after journeying many hundreds of miles, ascends some chosen tributary, to finally conclude its voyage, like the nesting bird, at a particular spot, cannot, it is evident, be guided by the same instinct that directs the aerial wanderer to the cradle of its existence. The

latter is enabled to pursue its course in straight lines, and its impressions of direction probably travel to it in like manner. Fish ascending a winding stream may need to turn toward every point of the compass; they cannot therefore readily act upon a monition emanating from one point only. Just as a buzzing fly upon the window pane is attracted by the light and avails itself of no other line of progression, so would migrating fish, blindly following a certain influence, probably become stalled if confronted with an obstacle in the path of their direct advance. A bird is not restricted to any one line of approach, but a fish that seeks its birth-place must penetrate the coast line at a particular point. It therefore needs a guide that will direct it over the sinuosities of its route, and infallibility of guidance can only be afforded by stimuli imparted to it along every portion of its devious trail. It must be assumed that it is an inherited perception of something in the current, and not the current itself, that enlightens the finny voyager. A fish in deep waters may be compared to an aeronaut whose balloon is immersed in a drifting cloud bank; to neither the aerial nor to the fluvial traveler is the direction of the current revealed, or even its existence, save by a glimpse of a stationary object.

Thus, the Potomac River shad, generation after generation, were guided from the ocean through the waters of the Chesapeake Bay to their natal stream. The distinctive quality of the river water that is recognized by the fish is seemingly derived from its source in the Blue Ridge, and when a number of shad fry, natives of the stream, were planted in the Kanawha, a river whose headwaters adjoin those of the Potomac, they voyaged their way to the distant gulf with a probable constant perception of the ancestral clue in the long stretch of virgin waters so venturesomely navigated. Nowhere, except along their journey's track, are their presumptive descendants, the Ohio River shad, found. When the ascending fish, upon their return from the gulf, sought a spawning place, they found their course, by virtue of an inherited instinct, infallibly charted in the river's bosom. Probably so guided and directed, their descendants turned, 1,202 miles from the Mississippi's mouth, into that of the Ohio, and 704 miles further turned into the Kanawha, ignoring the multitude of other streams that they passed on the way, their accomplishment at the point of ultimate attainment, exceeding two thousand miles.

In the open ocean the fish is probably guided by the same impulse of direction that actuates the bird, the insect and the beast, the perception being apparently received along straight lines. This directive impulse may be related to an entirely new class of phenomena that has lately come under scientific observation, viz., that of the so-called radio-active minerals, radium, polonium, uranium, etc. It seems likely that all substances possess radiating power, varying in kind and in degree, the more material manifesting itself as an odor, and in all its manifestations, projected along straight lines like light or sound. We know that fish wander widely, some, like the swordfish, shark, etc., not improbably voyaging from one continent to another. The fish of the under sea must traverse its depths of gloom with certainty of direction, and in the darkness of the night those of the surface pursue ways that are infallible. Nor can it be said that man is devoid of this mysterious power, the endowment of the fish slumbers within him, to guide him, when evoked, over the trackless waters of the deep, a power that, coupled with his vestigial gill slits, affords evidence of a lowly and a far-off link in his chain of ancestry.

In the equatorial Pacific from time immemorial a race of savage seafarers have found their way over immense stretches of the ocean waste, voyaging from island to island without compass or the simplest form of device for ascertaining position. They place, however, a probably imaginary dependence upon a sort of charm, a network of dry twigs, interlaced at random and jumbled together with shells, shark's teeth, beads, bright seeds, etc. Without these so-called charms, they will not go to sea, and no reasonable explanation has been offered by the various naval officers and other witnesses of the remarkable results apparently effected thereby. It may be suggested, however, to use a psychological term, that the mysterious accomplishment is a manifestation of savage subjective consciousness. In fuller explanation, it may be said that when a lowly organism receives an impulse to act, it responds about as automatically as a rubber ball upon impact. With that organism's advance in the scale of being, with its possession of widening spheres of perception and multiplication of sensory impressions it acquires a supervising intelligence that classifies the impressions received and relegates them to their proper source like the automatic switchboard of a telephone exchange. When a man sees, he knows that it is his eye that sees, and his mind dwells understandingly upon the color, form and other attributes of the object. Thus the understanding associates its perception with material objects, and its cognizance of the outward world is dependent upon the operation of familiar senses which long and constant use have rendered the only avenues of knowledge. When the operation of an obscure or dormant sense is sought, the mind seems to need a concentration upon its object, so that an opportunity may be given for the manifestation of the strange through the familiar sense. Perhaps it is thus that the divining rod becomes an exponent of the perception of water, and the savage's collection of trash may enable him to give expression to his dim consciousness of a far-off land.

In use, the contrivances alluded to are merely subsidiary, the pilot directing his entire attention to the sea. When a particular portion of the barren waste is reached, which to all appearances is empty water, all on board will scan it closely; they maintain that it is a critical point, and will even taste the water to insure a suppositious identification, then the chart is referred to, and a course adopted in line with some particular stick. These seeming trifles seem necessary to attach the mind to its subject, to give it a means of expression, and to constitute an invocation to the dormant sense to assert itself. It is a noteworthy fact that these so-called charts are available only to those who have passed over the route before; in other words,

to those who have been to the particular island or group of islands, and so absorbed a secret consciousness of its radiation or emanation. So also may it be inferred that the wandering fish, once in contact with a particular land area, becomes familiar with the outward projection of its peculiar characteristics, and is enabled to direct its course thereby.

The third and perhaps most mysterious of the ways of the fish in the water is that which seemingly owes its impulse and direction to the telepathic sense, or the faculty of remote recognition of fellow members of its species. Whether this faculty can be exerted as distantly as that of a perception of land areas we cannot know, but it would seem probable that the fundamental attributes of matter, whether organic or inorganic, are the same, and thus an indefinite outward projection may reasonably be predicated of all its forms. That this property of subtle extension and diffusion exists would seem clear, else the distinctive attributes of various colonies of migratory fish could not be maintained. Every shad or salmon stream has its distinctive fish; it is obvious, therefore, that the fry of each season's hatching must be enabled to search out in the depths of the sea the wandering parent school or particular colony to which they are related. In a watery void there can be no local distinctions, one portion of the waste is as barren of abiding characteristics as another; everywhere the monotony is absolute and unbroken. It cannot, consequently, be argued that the parent fish await their union with their tiny progeny at a recognized spot in empty water, and the roaming bands must, for such reason, form their junction by a far distant perception of each other, a perception that guides them, with unerring certainty, through the pathless obscurity of the deep.

It may thus be seen that the ways of the fish in stream and sea are three, and that each of these ways is deeply and darkly mysterious. Of the three wonderful things of old that passed the comprehension of the biblical sage none survive to confound the modern understanding. So, too, the ever rising sun of knowledge will enlighten the fish's obscure and doubtful pathway; the crooked will be made straight, and the inscrutable be made clear.

A. H. GOURAUD.

## Fish Chat.

BY EDWARD A. SAMUELS.

### Early Salmon Fishing.

It was stated in a Nova Scotia newspaper about the middle of last March that the season for salmon fishing had opened in the Port Medway River, although the ice had not all gone out. If this was the first announcement of the opening of the season, it was made later by two weeks this year than formerly, for in several of the rivers on the eastern coast of that Province salmon have been taken with the fly on or before the beginning of March. Now, that is saying a great deal, for it means that those streams are the earliest salmon rivers in the world.

This condition is probably owing to the fact that the westerly edge of the Gulf Stream, in sweeping up by that coast, has its effect upon the movements of the fish. The water in those rivers is as cold as in any others in the Dominion, the ice along their shores being two or three feet in thickness. Now, in New Brunswick or Quebec rivers salmon do not begin to come in until early in June, and the first run is not a large one at that, and why they ascend the Nova Scotia streams as early as they do, unless their movements are hastened by the warmth of the Gulf Stream, can only be conjectured.

These are bright and fresh run fish—not kelts. For the information of those who do not know what kelts are, I will state, quoting from "With Fly-Rod and Camera," "that black salmon or kelts are those fish that after spawning remain all winter in the river, instead of returning to the sea. They will take any bait in the spring; they are lean and lank, and the flesh is quite unfit for food, as it is soft, brittle, entirely devoid of the pinkish color, and, when cooked, the odor is often repulsive. These fish are as hungry as spring bears, and voracious as vultures; they snap eagerly at anything from a trout fly to a pork rind, and feed freely on the spring smelts that are ascending the river to spawn."

Yes, they are fresh run salmon, and not spent fish; in fact, I never heard of a kelt being taken or seen in any of the Nova Scotia rivers; for, in the first place, the streams are all too short to offer any temptation to fish to linger in them after the spawning season, and besides that, the ice forms on them a foot or two in thickness, and under that "slush ice" often permeates the water, so that the salmon cannot breathe it.

This slush ice is often fatal to young salmon and trout. I have been informed that on one occasion this formed so quickly in the Jacquet River, New Brunswick, that the sea trout—which could not escape from it—came floating down the stream on their backs in such numbers that several bushels of them were dipped out with nets, they being unable to offer any resistance.

Now, the great majority of salmon fishermen pursue their fascinating sport when the summer breezes gently stir the foliage of the trees around them; to them such accessories as the song of forest birds, the flitting across the river of gaudily painted butterflies, the perfume of thousands of wild flowers, and the persistent attentions from black flies and mosquitoes are almost deemed essential to a thorough realization of the pleasures of this their chosen recreation; and to these it would seem strange to clamor over huge blocks of ice or wade through snow two or three feet in depth which often cover the river banks when the early run of salmon comes in.

But there are many anglers—enthusiasts they are, to be sure—who enjoy the early fishing, rough though it be; and after all, if one hooks and plays his salmon, it does not much matter what the season may be, does it? He has the sport anyway.

People from the States have not, to any great extent, availed themselves of this opportunity for early fishing; but officers of the English army and navy, and anglers resident in Halifax, hail with delight the announcement of the first appearance of the fish, and lose no time in getting to their favorite casting places.

Of course, angling in the streams I have named is not limited to early spring, but continues well into June, salmon being taken with the fly in the Port Medway River as late as the 10th, and at the Indian Gardens, so-called, on Lake Rossignol until the 20th or 25th; all these waters are practically free, the fishing on the Indian River being controlled by the Mason brothers, who make no charge for the privilege of angling if either of them is employed as guide.

The Ingram River is free to all, and so are the East, Gold, Severn, Liverpool and Port Medway rivers, the Ponhook Indians, who are located at Greenfield, acting as canomen and gaffers on the last named streams.

To those who have a desire to obtain a share of the royal sport that is now to be had in the streams I have named, and have the opportunity to gratify that desire, my advice is to stand not upon the order of their going, but go at once; and if either of them obtains more fish than he can otherwise dispose of, let him send one to me with his card and the favor will be fully appreciated; for the salmon that enter those rivers are epicurean delights; they are as fine flavored as the best Penobscot salmon, and far and away ahead of those which are ordinarily taken in New Brunswick and Quebec waters.

The streams on the eastern coast of Nova Scotia are reached by way of the Boston boat to Yarmouth, thence by railroad to Middleton, from which point a connecting line runs east to Lunenburg, where there are stage connections for various localities on the coast. Or at Yarmouth one may take steamer which sails twice every week for Liverpool, from which town stages run to Caledonia, Bridgewater, Mill Village, where there is good salmon fishing, as well as to Port Medway and the South Shore.

#### Flies.

For early salmon fishing there, one has the best success with large and gaudy flies. Many a time have I killed a salmon in these waters with a fly that would frighten a Restigouche or any other New Brunswick salmon out of its wits. I have thrown out a Prince William of Orange fly so large that when it alighted upon the water it seemed almost the size of a goldfinch, but it did not alarm the Nova Scotia fish, for they seized it with avidity. During the month of May, however, flies of medium size are most desirable; as the mouths of these fish seem to be more tender than are those of salmon ordinarily, flies tied on the double are preferable to those tied on the single hook. As for varieties, I do not know as there is any great choice, for in these waters the fish, fresh run as they are, will come to almost anything that moves. However, if one is to choose a half dozen kinds for an outing there, I think that a wise selection would consist of Prince William of Orange, butcher, silver-doctor, light and dark Montreals, and Jock-Scott, and he will need at least a half dozen of each.

The rivers I have named are so well looked after by the fishing officials of the Province that there is little poaching done on them; in fact, outside of the Port Medway River, there is practically none at all; on that stream, however, the Indians do some spearing, and when they get the chance will draw a seine or set a net, but of late this work has been pretty effectually stopped. They are, however, given by the authorities certain privileges injurious to the fishery interests in a high degree.

For example, they are permitted to catch the parrs or smolts of the salmon in as great numbers as they choose; I have seen them at Greenfield and at Molega peddling large strings of the young salmon which were from 6 to 9 inches in length, and I found on inquiry that it was a common practice for them to do so, and that they sometimes catch several bushels in a season. Now, this is an illustration of the story about the Irishman, who, on being asked if one man is as good as another, replied, "He is, and a dom sight better," for this wasteful privilege that is given to the Indians would not be vouchsafed to white men.

It seems very strange to the looker-on that the authorities who are spending considerable sums of money in stocking the rivers of the Province with salmon fry, should permit such extraordinary wastefulness to go on.

#### Habits of Young Salmon.

Apropos of parrs and smolts, it seems to me that their general habits are not very well known. It is a well established fact that the banded parrs increase in size until they become smolts, which are more or less silvery in color before they descend to the sea, and that after passing two or three years there they return to their native streams, grilse; but for a long time I was unable to decide how and where they lived in the period between the fry and the developed smolt stages.
